At first many thought that it would be a difficult problem to breed sound leg Blacks and maintain good surface and undercolor with freedom from white or grey. By careful selection this has become possible and to-day the winning birds in our best shows are sound in all color sections. The Black Leghorn presents a most beautiful green sheen plumage to-gether with bright yellow legs, bright red comb and ivory white ear lobe as much to be admired. On the other hand for the commercial or utility man the breed presents a fowl of usual value. It was their persistent laying of nice eggs that induced me to go strongly into breeding them. Having at the present time six varieties of Leghorns,I am in a position to test and know their real worth. I have found from actual experience that Blacks are the fastest growers and reach maturity quicker than the other varieties and as a result from this lay earliest. For several years each fall our Blacks are laying steadily before the other varieties have started. They lay nice eggs and will under reasonable care lay well throughout the cold winter months, however I was never among those who advocated Leghorns as the best winter layers. I am sure they are not. Some of the more heavily feathered fowls of larger size will in the climate we have here produce more eggs during the severe weather. This however would perhaps not be true in a more moderate climate as the thermometer here often reaches 40' below zero. But even in this severe climate our Leghorns give a very satisfactory egg yield. But take it for 12 months I am fully convinced that the Black Leghorns will lay as many eggs as any breed. Being non-setters they lay steadily and being great foragers will if given opportunity produce eggs very cheaply.

The present day Black Leghorn is creating much attention and admiration throughout the land and many breeders are taking them up and if carefully bred along right lines will, I am sure, soon rank next to their S. C. White cousin in popularity. Many hesitate to breed them fearing that since they are a black fowl they will not dress well for market purposes. This is without foundation as they have the rich yellow skin of the Leghorn family and present a very nice appearance when plucked, which is not true of many Black varieties.

To those who want to take up a breed which is on the eve of a country wide boom and which will prove very popular in a short time I do not hesitate to recommend the Black Leghorn for I have yet to learn of a single person who has once bred Blacks and has given them up for any other breed.

MRS. IRVING F. RICE

LATE HATCHED CHICKS. CARE AND FEEDING HABITS, ETC. HOUSEHOLD HINTS.

The cold backward month of April will be responsible for many late hatched chicks this season, by late hatched I do not mean those that are hatched in May, as I consider May hatched chicks seasonable and for most of the popular breeds early enough to mature into profitable fall and winter layers, always providing that good care is given them. There seems to be a general report from most sections of poor hatches in the eggs first incubated. This will also increase the percent of later hatched chicks. After the hens have access to the ground the fertility is better and germs stronger, and less trouble will be experienced along these lines. Taking into consideration the above facts, it behooves those with early chicks to give them every opportunity to develop, as the demand for them is sure to be great and prices correspondingly high. Unless desired for exhibition, when it is very true that "The early bird catches the blue" pullets hatched in May and even the first of June can be brought to the laying stage in November, and this is early enough to capture the highest of the market prices for eggs. We have had pullets hatched the 29th of June which could not be selected from the earliest pullets in January, of course the treatment of late chicks must vary considerably from those of the earlier ones, and they must be separated from any older chicks, so that they may have every chance to grow and not be crowded away from food and drink as they are sure to be when allowed to run with older chicks. We have about six hundred hatched in March and I assure you that it has been no pleasure to care for them and to keep them in a thriving condition, for four or five weeks with the temperature as low as we have had. It has taken never flagging vigilence and many cold trips to the houses at all hours of the day and night to make sure that the heat was as it should be, and were it not for the demand for early hatched birds in the fall, we would not attempt to raise any until the weather is suitable. If we could plan our hatching as we should like to, our chicks would all arrive at one time and that time would be about the middle of April, by having them hacthed all at one time we would do away with a great deal of work and our flocks would be more uniform and consequently would mature better. Chicks always seem to grow better when the weather is warm enough so that they can be gotten into the ground as soon as they are strong enough, there is something that they secure from Mother Earth that we know no substitute for. When they are first put into the ground they have a small yard made of wire net ting to run in, but as soon as they have learned to run out and in and are strong enough to permit, the netting is rolled up and they have their liberty. Then it is that the old adage "Chickens come home to roost" is exemplified, because strange as it may seem and as far as they may stray during the day, when night comes each chick will repair to his or her alloted home, and when fall comes and they are brought into the winter houses they will still go back to their old home at every opportunity.

With the advent of warm weather we must be on the lookout for mites and the other insect pests to which chicks are heir, incubator chicks do not have very much trouble with lice, but even worse are the little red mites which do not stay on the bodies but are nocturnal like the bedbug, and infest the cracks and crevices in and under the hover and in fact the whole interior of the building. They multiply very rapidly and before you are aware of their presence there will be literally millions of them. Perhaps the first inkling that you have of them your chicks will begin to droop without any visible excuse then commence to look for mites. You will not see them unless you search for them, as they get in their deadly work in the dark and hide during the day light, descending upon their victims after they have gone to roost or are under the hovers and sucking the life blood from their bodies until it is no wonder that they do not grow, and the only wonder is, that they can live. The best way that we have discovered to fight mites is to take boiling hot water and pour along the cracks and the roosts and in fact every place where they could hide. They cannot survive this treatment and it also kills the eggs, then with a paint brush thoroughly paint the inside of the

brooder or house with crude carbolic acid and kerosene mixed two parts kerosene and one part crude carbolic acid. This will usually exterminate them for one season but it is a good plan to look for them occasionally, and you will feel well repaid for your labor by the way in which your chicks will brighten up and begin to thrive. We are planting sun-flowers and corn around the colony houses which will provide shade when the sun gets too warm for comfort, and will also act as protection from crows and hawks, the drinking vessels are also placed in the shade of them and so does not become stale as quickly.

These colony houses are so built that they can be moved from place to place and are never left in the same position for two consecutive years, this gives them clean soil to run upon as the land surrounding them is plowed and cropped each year. It is impossible to raise chicks upon the same soil year after year with success, of course the soil itself has much to do with this, a soil composed of clay soon becomes contaminated and is out of the question for successful poultry keeping while a sandy loam which drains well after each storm can be used indefinitely if the houses or brooders are moved and the soil occasionally plowed.

It is strange how fascinated a chick or fowl is by unclean things such as a dead carcass or a pile of stable manure and yet how necessary it is to have every little detail connected with the growth of a chick absolutely clean to get the best development, their quarters, drinking vessels and feed troughs must be kept sweet and clean or bowel trouble is the result and especially is this true, during hot weather when any left over food will sour very quickly after they are two or three weeks of age they are given a moist mash occasionally and great care is taken that none is left over to sour, but that they are given just what they will nicely clean up. After they are given their liberty there is very little concern regarding over feeding. It sometimes seems as if it was impossible to do this, they are very much like growing children always hungry, and this is as it should be, when a chick has a voracious appetite and is hustling about there is very little for us to do but to supply the feed and water and lock them safely in at night.

To rid the pantry of ants, mix cayenne pepper and borax and dust it around the pantry shelves.

To keep a placket from tearing down sew a hook and eye at the very bottom of the placket on the wrong side. Hook together, pinching the hook down tightly and it will never come unfastened.

The dandelion is one of nature's best medicinal vegetables, being rich in tonic salts, and its use will not only add variety to early spring meals but will be beneficial to the health of the family. A few dandelion receipes follow:—

Dandelions should be boiled in rapidly boiling unsalted water, until very tender, drain and cut fine in a colander, for each cupful of chopped dandelion allow two hard boiled eggs also chopped fine, mix well adding salt, pepper and butter, mix with a little salad dressing and pack in molds, when cold turn out upon a lettuce leaf and serve with a spoonful of dressing.

Dandelion with Bacon.

Slice two ounces of bacon, put into a hot pan and cook until a golden brown, stirring frequently to keep from burning. Mix one tablespoonful of sugar and one-half tea-spoonful of salt with one-half of a cup of weak vinegar and pour into the pan with bacon, when the mixture boils pour it over about a quart of dandelion which has been mixed with three hard boiled eggs and one small onion chopped fine. Turn lightly with a fork until the dandelion is slightly wilted by the hot dressing.

When boiling eggs, wet the shells thoroughly in cold water before dropping in the boiling water and they will not crack.

In Rhubarb Time.

Rhubarb is one of the most appetizing and healthful of the early spring products and it is used in other dishes than pie.

A delicious sherbet is made from rhubarb. Cook a pound of rhubarb until soft in one quart of water. Strain off the liquor. Sweeten well and freeze as you would sherbet.

Rhubarb and orange marmalade is fine. Pare nine large oranges and cut in small pieces. Add two pounds of granulated sugar. Cut two pounds of rhubarb in small pieces and add. Simmer gently for two hours and put into glass jars.

Limewater.

There are so many uses for limewater in the household no home should ever be without it. It is used to keep milk vessels wholesome, to make the milk digestible, to soften water, sweeten drains, etc. By beating limewater well into olive or linseed oil there results one of the best known remedies for burns and scalds. To make limewater put a lump of quicklime as big as the two fists into a clean earthen pitcher, pouring over enough fresh drinking water to cover it six inches deep. Stir well with a wooden spoon, let stand half a day and then pour off the clear liquid without disturbing the lime at the bottom of the pitcher. Strain through double cheesecloth and then keep in small bottles tightly corked. When using always pour off a little from the fresh bottle or one that has been opened. Thus one gets rid of the crust that forms.

NOTICE.

It is the desire of the editor of this Department to make this particular Department one of the features of "Everbodys" and in order to do this she must have the hearty co-operation of every Lady subscriber and reader. She is well aware that every one of us knows some little helps which would be worth passing on and every house keeper has some particular receipe in which she excells. Therefore I not only invite you but I earnestly urge you to exchang them through the medium of this department, and thereby help and receive help. Please sit right down and jot down the first helpful hint or favorite receipe that comes into your mind, and send them at once to me, and then keep on thinking for our united benefit. If on the other hand you very much desire a certain receipe or information concerning this great business of Home Making which belongs to us, ask for it through this department, and your queries need not be confined to Home Making but may embrace your poultry ventures as well, when immediate replies are desired please inclose stamp for reply.

MRS. I. F. RICE.

PROFESSOR HARRY R. LEWIS.

We are pleased to show our readers in the above print, a good likeness of Prof. Henry R. Lewis, one of our regular contributors, and who is in charge of the Poultry Department of the New Jersey State College, at New Brunswick, N. J.

Prof. Lewis was born on a R. I. Farm, graduated from the I. I. State College in 1907 and from then on until 1910 was Prof. of Agriculture at the Baron De Hersch Agricultural School, at Woodbine, N. J. When there he built a large poultry plant at the school for educational purposes with a capacity of 2,000 birds.

In 1910 he was called to Rutgers College, where he has been ever since, devoting all his time to poultry, educational, experimental and extension. During the past four years, Prof. Lewis has written three Poultry Books that are to-day accepted as Standard work, viz, "Poultry Laboratory Guide", Productive Husbandry and Poultry Keeping". He is a constant contributor for leading poultry and Agricultural periodicals, covering both the popular as well as the scientific field. We have arranged to have Prof. Lewis as a regular contributor to Everybodys, and he will devote his best efforts in supplying original articles monthly. Don't miss a copy of Everybodys.

H. P. S.

PRIZE HENS KILLED; OWNER GETS $2,500.

A verdict of $2,500 against the United States Express Company for shooing twenty hens to Washington Market and an untimely death was brought in yesterday by a jury of eleven white men and a negro before Justice Vernon H. Davis, in the Supreme Court. The hens belonged to Frederick Harris and were all prize winners.

Cooped together they were shipped in 1911 from Flemington, N. J., to New York. This was after ten of them had taken prizes at Madison Square Garden. The other ten, in two pens of five each, had taken first prizes at the Garden. These were White Orpingtons. All twenty got to this city, but were delivered to G. Z. Hawk, a Washington Market dealer, who wrung their necks.

H. D. Marchant, of 149 Broadway, counsel for the bereaved owner, produced in court all the ribbons and silver cups the hens had won. He also called experts, who said they were worth $3,000. Lawyers Kerfoot and Curry, of 2 Rector street, appeared for the Express Company. The jury gave the full amount sued for and $597 interest besides.

The Marketing of Eggs

North Carolina Department of Agriculture. By B. F. Kaupp.

Forty-five million dollars a year is the annual egg loss of the country due to faulty methods of handling on the farm where eggs are not collected frequently and marketed regularly. Because nests are not kept clean and through allowing males to run with the hens in the warm months after the breeding season. A fertile egg will start to hatch or develop the embryo if kept at a temperature above 80 degrees. If kept at a temperature of 100 degrees or above for three or four days blood will form. From this it can be seen that in the hot summer time it is essential to gather the eggs once, or better twice a day. Keep them in a cool place and market them once and still better twice a week. Keep the nests clean and provide one nest for each four hens. Grocerymen keeping eggs on display in the hot summer time find in three or four days if the temperature is extremely hot, the eggs spoil. Such eggs are known as "heated eggs". If males do not run with the hens the eggs are not fertile and these blood rings do not appear.

The advantages of infertile eggs for the market are: The eggs do not hatch, do not develop germs, withstand heat, stand shipment well, easily preserved, slow to decay, best for cold storage, cost less, male birds not required, and are produced just as often as fertile eggs.

A careful study of preventable losses on the farm shows the following: 2 per cent loss on account of being dirty; 2 per cent on account of breaks; 5 per cent on account of chick development; 5 per cent on account of shrink or being held; 2½ per cent on account of being rotten; ½ per cent on account of mould or bad flavor.

Late in November while investigating market conditions, the writer observed first grade, clean, uniform size eggs, selling on the Boston market at 60 cents a dozen. These were labelled "near by hennery". Similar grade eggs marked "eastern hennery" 46 cents a dozen, and fresh "western" 34 cents a dozen, while cold storage eggs were selling at 28 cents a dozen or less according to grade.

In the large markets as New York City and Boston, eggs are sold according to size and quality. On the New York market when a pure white egg, clean and with fine texture of shell and uniform size, weighing at least 26 ounces to the dozen, sells for 60 cents. The same quality in a brown egg may sell as low as 50 cents. Mixed, that is different colors, sizes and shapes and dirty may sell as low as 38 cents a dozen. Then, still lower prices for No. 1 cold storage, No. 2 cold storage and checks.

In selecting laying stock it will be well to keep in mind the market demands and in handling the eggs market only clean eggs and handle them on the farm as indicated above so that the producer makes the most money out of his products.

Preserving Eggs.

With the coming of spring and summer, the supply of eggs grows greater, and the price falls. As a result of cheap eggs we are moved to devise some means of preserving them, at least, in as fresh a state as possible, till eggs are again high priced and hard to secure. Eggs, if properly handled. can be kept for several months.

Cold storage is beyond the reach of the average family so some other means must be devised for keeping them. In cold storage they are preserved in a dry state.

In candling an egg which has been in cold storage, it will be noted that the air cell is larger, which indicates that the egg content has shrunken. This shrinkage takes place as a result of evaporation of fluid from the egg through the pores or small openings in the shell. In candling eggs that were just laid it will be found that the air cell in the large end of the egg is very small. Eggs may be preserved at home in liquid and if the eggs be kept in a liquid for several months and candled it will be found to show no loss through evaporation.

The most common method of preserving eggs in liquid is as follows:

A glazed earthen jar makes the best vessel. Secure from the drug store a quantity of water glass and make a ten per cent solution by adding one part water glass to nine parts water. The vessel must be cleaned and scalded and the water in which the water glass is dissolved must be boiled. The eggs can now be placed in the solution each day as they are gathered. The solution must be at least two inches deep over the eggs.

Eggs thus preserved will keep in good condition for six to ten months.

Notes.

Every farm should double its output of poultry products this year. There is a greater demand than supply.

Every one interested in poultry should become a member of the North Carolina Poultry Breeder's Association. If you are not a member, write to the Secretary to-day and ask him for a membership blank. His name and address is J. T. Bland, Raleigh, N. C.

The Intelligence of the Goose.

By Michael K. Boyer.

The peculiarities and intelligence of geese has been the subject of many an interesting tale. Some of these antedotes are securely creditable, yet those who have kept studing the nature of geese are ready to accept almost any tale that may be told of them.

Morris relates a number of instances where ganders have become the inseparable companions of their masters, following them about the fields on hunting expeditions, and into the streets of a town, like the most devoted dog.

The same writer also relates how faithfully a gander discharged the self-imposed duty of guardian and guide to an old blind woman. Whenever she went to church he directed her footsteps into safe paths by taking hold of her gown with his bill, and during the service he nipped grass in the cemetery close by, until she required his services as guide to return home.

Another incident is told that is said to have occurred in a town in Pennsylvania. A man was playing an accordian when it was noticed that the pet goose on the place became fairly intoxicated with the music. He kept excellent time with his feet all the time the music continued. Noticing the bird's liking for it, the man repeated the tunes time and again, the bird each time showing its appreciation.

The writer one day was driving with an old-time resident along a country road in Massachusetts, when an old lady was noticed coming along closely followed by an old gander. When the old lady stopped to talk to a passerby, the gander would also stop and look up into the face of the stranger all the while he or she was talking, just as though it understood every word that was spoken. The bird's whole life seemed to be wrapped up in the affections of that old lady, and they were inseparable companions.

Our companion informed us that this gander would lie in front of the house perfectly contented so long as the old lady was indoors doing her work, but the moment she appeared ready for a walk the bird would greet her with a peculiar cry and walk closely by her side.

Geese are ever on the alert, becoming vertiable watch dogs during the day and night. The approach of a stranger is the signal for shrilling yells which cannot be mistaken. It was this trait of watchfulness that gave the geese credit as early as 388 B. C., for saving Rome from surprise and capture.

Geese are long-lived, some instances being recorded where they attained a great age. In 1859 a goose was exhibited at the New Jersey State Fair, and her history, on a placard tacked on the coop, read as follows.

"Madam Goose is now owned by Robert Schomp, of Readington, Hunterdon county, New Jersey. She has been in his possession 25 years, and was given to him by his grandfather, Major T. G. Schomp. Robert's father is now in his 85th year, and this goose was a gift to his mother as a part of her marriage outfit. The mate of Madam Goose was killed in the revolutionary war, being ridden over by a troop of cavalry. In the spring of 1857 she laid six eggs, three of which were hatched and the goslings raised. In 1858 she made seven nests and laid but two eggs, evidence perhaps of failing faculties. Her eyes are becoming dim, one having almost entirely failed. The year of her birth cannot be known, but she remains a representative of the olden time."

Nearly 30 years ago William Rankin, a noted breeder of geese, purchased in Rhode Island a wild gander which had been owned by one family some 50 years. A member of the family had wounded the gander by firing into a flock of wild geese, breaking his wing. The gander recovered from his injury and was kept for that number of years, without however, mating with other geese. Several years ago it was reported that he was still alive, doing service as a decoy bird during the gunning season, and highly valued by his owner, although at least 75 years old.

Mr. Rankin cites the instance of a goose owned in Boxford, Massachusetts. where it was the property of one family for 101 years, and was then killed by the kick of a horse. She had laid 15 eggs and was sitting on them when a horse approached too near the nest; she rushed off, in defence of her eggs, seized the animal by the tail, and was killed by a kick from him.

In former times it was not uncommon for the farmer's daughter, on her wedding day, to receive, among her other gifts, a goose from the old homestead, to become her property and accompany her to her new home. In some instances such geese were kept for many years, perhaps far beyond the life of the young lady to whom it was presented.

Geese have a number of peculiarities which are interesting. When

sexes are equal, geese pair and become very much attached to their mates, seldom proving unfaithful. They have a strong attachment to their home. They are grazers, their bills being provided with sharp, interlocking edges, designed to readily cut and divide vegetable tissues, and the tongue at the tip is covered with hard, hair-like projections pointing towards the throat, which serve to quickly and surely convey the bits of grass and leaves into the throat.

Goose grease from time immemorial has been considered a sovereign remedy for rheumatism, lumbago, stiff joints, sprains, etc., and the Hebrews prefer it to lard for cooking purposes. In Europe the liver of the goose is sold to pie makers, who make of it the well known pies. As high as $4.00 per dozen is paid in Europe for these livers. Geese are the cleanest fowls alive, being very particular about the condition of their food they seem to appreciate the care and attention they receive, and soon learn to know their attendants. In China goose manure brings a high price, but its value has not become recognized in this country to any great extent.

Ganders occasionally take very peculiar freaks, such as conceiving a violent attachment for some inanimate object as a door, a stone, a cart wheel, a plow, or something of a similar nature, when they will spend the greater part of their time sitting beside it or in its company.

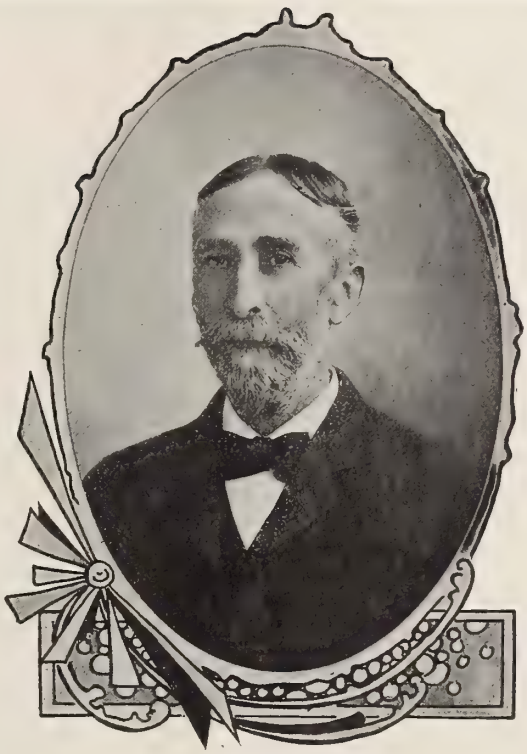
Should the gander be separated from his mate and placed with another, he will seldom accept the new one so long as the old mate is anywhere within hearing distance, and even when entirely removed from the premises, it frequently takes some time before he will become reconciled to his new mate.

The broody goose plucks off more or less down from her breast with which to line the nest and cover the eggs when ever she leaves them. During breeding season ganders, and even geese when sitting, or in defence of their young, manifest considerable courage and often punish intruders severely. When interfered with they seize the intruder with the bill, strike with the wings, and sometimes scratch with the claws, they have sufficient power in the jaws to bite quite hard, and a large, full grown gander has been known to strike hard enough with the wings to break a person's arm.

When a goose is hatching she must be watched, but not disturbed. The actions of the gander at this time is interesting. He keeps standing on one leg for weeks—probably his way of doing penance—and has one eye half shut, keeping guard that nothing can approach the nest. Just as soon as the first gosling breaks the shell, the gander closes in and draws his defence closer, and stands or walks on both feet now. Should one approach the nest, the old goose will stretch out her neck and resist the intrusion to her utmost, while the gander will execute a flanking movement that is very disconcerting.

Young goslings quite frequently roll over on their backs while in the pasture, and unless righted will lie in that position until they die. They are unable to recover themselves. If the mother of the unfortunate gosling is a goose, she at once understands the young one's predicament and quickly rights it, showing wonderful example of intelligence; but should the mother be a hen, she does not know what to do, and the consequence is that the little one is allowed to lie there and struggle until it is dead.

Years ago, and we presume it is the same to-day, geese were herded in large flocks in Strasburg, on the European continent, in charge of a shepherd. The birds were reared by the peasantry, every one of whom was possessed of some stock of these fowls. The shepherd every morning would wake the echoes of the village by the sound of a trumpet, with which he assembled his feathered flock, which, in the company of a herd of pigs, repaired to pasture on the common devoted to that purpose. In the evening the shepherd led back his flock; but, before they arrived at the village, almost all the geese would take flight, rise above the roofs, and settle down in their respective homes. They flapped their wings, crossed, and flew against each other in the air, uttered a cry not unlike a note of a horse trumpet, and presented an animated scene to the delight of the villagers.



C. H .WELLES, Stratford, Conn.

There are names of Breeders in this age that will ever grace history pages for their successful poultry work. In Barred P. Rocks we have several men who have advanced the breed anl those personal achievements have been of particular work and advantage. To Mr. Chas. Henry Welles, Stratford, Conn. we can always point out with special pride. From a boy on he has always been a "chicken man" and for all the years he has been breeding, he has been also soliciting heavy to his credit record made at the Madison Square Garden, New York, that has up to this year never been equaled. His consistent winning year by year for all those years, proves the special value of his line.

A few years ago Mr. Welles produced his "famous Hen" "Fluffy Ruffles", the champion of them all. For two years she won the highest honors, winning each time first prize Hen and championship female in the class. Mr. Welles has produced many other notable winners and is still at it with a line that is sound in quality, reliable and dependable.

Notes and Comments.

BY

H. P. SCHWAB,

In our last issue was shown two beautiful pictures of winning Campine females owned by the Homestead Campine Farms, Wayland, Mass. With foot notes written by Mr. F. L. Sewell, to which we wish to call your special attention. Note their shape, color and markings which he has faithfully portrayed well showing the wonderful quality of these birds and of this line, as we understand them. Vigor is noticable so is good bone and size, with the best of carriages.

This line has been a leading win ner, at the late Boston Show they won 2nd Pullet, 2nd and 3rd Pen, 1st and 2nd Display, 1st and 11 Special Prizes.

It is always a pleasure to meet a breeder and fancier like Mr. Rufus Delafield, owner of the Sunswick Poultry Farms, South Plainfield, N. J. Specialist breeder of S. C. Buff Orpingtons.

His entire interest is in his poultry business, every detail of which receives his personal care. His method has built up a great line and a great business while his winnings for so many years made at our Greatest Shows well tells the real quality of his strain.

The Sunswick plant itself is one of exceptional interest, one that has been enlarged year by year to meet the demands made upon it for stock, eggs and for Baby-chicks. We have often called there to inspect his line and have always noted features of interest, there was always something to admire and to learn there.

Mr. Delafield's new mating list is just at hand, this gives all the required information of this line and is mailed free for the asking. Every breeder of Buff Orpingtons should have this.

Upon the quality of food used, depends the proper growing and the maturing of your birds, bear this ever in mind and insist upon having the best. Orr's Chick foods, made by Wm. Orr & Sons, Orr's Mills, N. Y. has been accepted as a standard food for these many years, and has been most successfully used by leading breeders the country over. Those who have seen the New York Shows and the exhibits of those peerless breeders, Messrs. D. W. Young and E. B. Thompson, could see in their winners not only breeding quality, but also growing and feeding quality. They like others of note use the Orr Foods and recommend its use.

Both chicks and fowls alike require the best, good seasoned wholesome food at all times, and this is just what we know Orr's feeds to be. A trial order will convince you of its purity, quality and value alike.

Rhode Island Red breeders have shown wonderful progress made during the past few years, and particularly during the past year or two, the improvements are combined in both shape and color and are of the kind to bid well for the future. Mr. E. M. Dutton, New Fane, N. Y. was one of the early breeders of both Single and Rose Combs, yearly making several exhibits and as many records. Mr Dutton devotes all his time to his poultry and personally attends to all orders, their packing and shipping. His line is one that will re-produce, and that has the quality we all aim for.

In our last issue on page 23 was shown a full page illustration of the First Prize Madison Square Garden, New York, Black Orpington Cockerel that was bred and exhibited by the Foxhurst Farms, Lime Rock, Conn.

This illustration is from an unretouched photograph made at the New York Show by artist Louis Stahmer, of the A. P. J. Foxhurst Farms have shown many winners, all worthy birds, but never before have we seen an Orpington the equal of this one. While the picture shows him a mite low, he has good and proper length of leg, a beauty shaped breast and body, and a simply wonderful back and tail, his finish was perfection and his color of the richest and soundest kind. Black Orpingtons as bred by Foxhurst Farms are a most valuable and attractive line.

MR. E. E. RICHARDS.

Cedar Rapids, Iowa.

In Mr. Richards, we have a most popular Candidate for President of the American Poultry Association. He has no opposition and will be elected by a unanimous vote. We look for his administration to be one of special interest and value to all poultry interests. Mr. Richards is peculiarly well fitted for this office, his qualities, with experience and knowledge of condition, assure progress with the unlimited harmony assured through the efforts of his predecessor in office, Mr. E. B. Thompson, who retires with his work well done and the respect of all members and breeders.

We wish Mr. Richards every success and congratulate the American Poultry Association upon its selection for President.

Henry P. Schwab.

NOW FOR RED SUSSEX EGGS

Last year my first prize pullet at the Philadelphia show in Dec., which won the silver cup for the best bird in the entire English class, was a May egg, hatched June 12th. My 1st pen cockerel at Boston, Jan., 1915, was hatched in the same brood. Send at once for mating list. I guarantee 8 chicks or duplicate free.

F. L. PLATT, SWANTON, OHIO.

The Uhl Hatchery

Largest in America

We Hatched 450,000 Chicks

During 4½ Months the Past Season.

Many of our customers report winning prizes at shows. We furnish chicks from the finest show and utility stock obtainable. Be sure to get our catalog and prices.

M. Uhl & Co.,

New Washington, Ohio

When you think of Tompkins, think of Reds also. Mr. Lester Tompkins, Concord, Mass. has bred Reds all his life, as did his father before him, making this strain one of the foundation lines of the quality Reds we have to-day. We have been at Mr. Tompkin's home several times and have always seen there a line of birds and matings of finest quality, made with evident care and with the best of condition. He sells eggs without reserve, all are birds with records and a very long line of breeding value back of them. At this time he is making special offers on stock that should interest many with mated trios and pens a specialty. Write him your wants. Always mention "Everybodys."

Single Comb Black Leghorns in size and shape equal the whites as they are bred at the Turtle Point Poultry Farms, Saratoga Springs, New York. With sound color, good legs and very fine head points. They also breed Rose Comb White and Brown Leghorns and Single Comb Silvers.

This line was a feature exhibit at several shows this past winter where prizes almost without number were won. Write for their list.

That Standard bred quality and utility combine to make the Standard bred stock more popular and valuable has been shown time and time again. Lately another record was brought to our attention, it is that made by the Old Forge Poultry Farms, Spring Grove, Pa. and owned by Mr. P. H. Glatfelter. We have seen this line at their home, also as winners at several shows, well knowing their high quality and worth from breeding and Standard view points, this with their record made at the Missouri Egg Laying contest, where one of their pullets laid 229 eggs is worthy of consideration. Others of this same line have done as well, and it is evident that Mr. Glatfelter has selected and bred his line with extra laying quality always in view.

There are few, if any older or better known breeders of poultry today, than Mr. August D. Arnold, Dillsburg, Pa. He has always been foremost in progress, has imported and introduced many new varieties and has established them here. Mr. Arnold is now breeding the Red Sussex, Favarolles and Campines, all of which he has a large stock of and is at this time offering both eggs and stock at special prices.

If you are interested in these varieties, write Mr. Arnold, it will be to your advantage. He offers Red Sussex eggs from his imported stock at the special price of 30 eggs for $5. in the other varieties he offers eggs at 30 for $3. Here is your opportunity to get a good start with these popular breeds at a very cheap cost. Write him your wants, and mention Everybodys.

We are just in receipt of Mr. Chas. H. Welles, Stratfort, Conn., mating list for 1915. This list is always one of interest as his line of "Fluffy-Ruffles" Barred Rocks are known and is being bred the world over with the best of success. If you are a breeder of Barred Plymouth Rocks, or are interested in them, in any way, write Mr. Welles for a copy, it is free to all.

Are you interested in White Cornish? If so write to Mr. Jno. H. Sheffer, Box 237, Dillsburg, Pa., who is one of the leaders in this variety and whose birds have won at Williamsport, Hagerstown, Harrisburg, etc. White Cornish are one of the popular varieties of the day, they are a good all-purpose breed, sure to please.

Secretary Henry D. Riley of the American Barred Plymouth Rock Club is up and doing every day, he is one of the busy men we happen to know of, in his care the club is booming, and the good old Barred Plymouth Rocks are still way in the lead with popular favor theirs. Since the last Annual meeting held at Pittsburgh over a hundred new members have been admitted.

Now he is arranging for the annual club catalogue and we join him in the request that all breeders join and have their name appear in this new book. The club will again offer at the coming shows their usual Cash Prizes along with State Cups, while the Shape and Color ribbons are again open for all associations to accept and to award. Write Mr. Riley to-day. Join the club and do your share in this grand work. Address Mr. Riley at Strafford, Pa.

There are so many good things on the market that we wish to recommend to our readers as worthy of trial and of constant use. One is Blatchfords Milk Mash for little chicks. This is a staple article used with much success by breeders in every section of this country. Blatchfords make a complete line of poultry foods that will be of interest to all that grow and keep fowls, write them for their circulars and address for this, Blatchfords Calf Meal Factory, Waukegan, Ill. Always mention "Everybodys."

Baby Chicks and Eggs For Hatching

from my great exhibition—Utility White Wyandottes and Mottled Anconas.

Write me before ordering elsewhere. My prices are within your reach. Safe arrival of baby chicks, and satisfactory hatch, guaranteed. A few choice cockerels at $2 to $5 each.

Lone Oak Poultry Yds, Batavia, N. Y.

WHATGLEN S. C. Black Minorcas

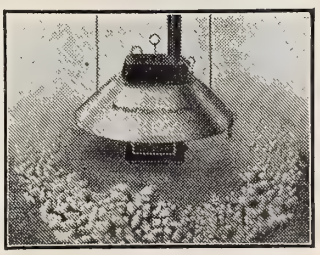
New York State Fair Winners, 1914.

In a class of 125 Birds they win Cock 1-2-3. Hen 1-3-4. Cockerels 1-2-3. Pullets 1-2. Old Pen 2. Young Pen 2-3. Best Display, and Specials.

Eggs For Hatching from selected Matings. They are the "Worlds Best" Breeders. For Sale. Mated birds a specialty. Large Handsome Catalogue for asking. Write for this to-day. Address.

Frank McGrann, Box E. Lancaster, Pa.

THE HILL SELF-FEEDING, SELF-REGULATING, COAL-BURNING COLONY BROODER



Will Raise Your Chicks Better Than a Hen.

It is the only brooder equipped with safety magazine, which absolutely prevents any gas from escaping in the house, and at the same time automatically feeds the fire, making it possible to maintain an even temperature of pure, warm air under all conditions which is positively necessary to successful brooding. It is fitted with Ransom Duplex Grate, the greatest grate known. The brooder is perfect in operation, simple in construction, will last a lifetime and fully guaranteed.

Send for circular and price list of the brooder that solves the brooding problem.

Address, Mercer Poultry Farm, Trenton, N. J.

SUBURBAN STRAIN

S. C. Rhode Island Reds

Winners at Hagerstown, Allentown, Lancaster, York, Hanover, etc.

A lot of choice breeding males must be sold.

day-old chicks.

A guarantee with every order.

E. K. EICHELBERGER,

DESK A. A., - - HANOVER, PA.

EVERYBODYS NEWS *from* EVERYWHERE

BY JAS. T. HUSTON

Did you like the April issue of Everybody's Poultry Magazine? If you did, tell your friends. If you did not, tell us, and we assure you your reasons and suggestions shall be given careful thought.

As this Poultry Magazine is issued for Everybody, we propose making it wide in its scope, and a Magazine which shall be a welcome visitor in the homes of all.

Mr. Geo. J. Eckhardt, of the Flower City Show, Rochester, N. Y., has done much in making this show of National Importance and much credit is due him in this respect. The Flower City Association is already at work for next Winter's event and we are informed by the management that this will be their greatest effort.

Beautiful month of May, with all her beauties of nature is here, and to no one is she more welcome than to the lover of poultry and the out door life.

Surely something is wrong with the man or woman, who cannot live to the full enjoyment of life at this, the morning time of Spring. If you are not enjoying life, the chances are that all you lack is a cure for the Spring Fever. We therefore suggest as a quick and lasting cure, "The Poultry Fever". Some diseases you know counteract another.

Perhaps no other state in the Union has more "died in the wool poultry cranks" than the State of Ohio, and on looking over the list of Middle West exhibitions the past season, we find grand records made by the exhibitors from that state.

Indiana is another who boasts of her poultrymen as she does of all the other men, who have made this one of our most productive sections of the country. Truly she may show pride in her men and women engaged in the great poultry industry.

That Parti-colored jury, which gave to the owner$2,500 in damages, in a case of carelessness by the express company, in handling prize White Orpingtons to Frederick Harris, is another evidence that by keeping at the express companies, results can be secured. While this jury consisted of eleven white men and one colored, they all agreed that "variety is the spice-of-life and the they should not be partial to color, etc.

The National Bantam Association Year Book for 1915 has just been issued and mailed and is full of good things from cover to cover. With elegant illustrations and printed on fine quality paper, it is indeed inviting to read. More and more the Bantam breeders are branching out, and in this Everybody's hopes to assist. Read our Bantam Department and tell us what you think.

Along the lines of Bantams and their breeders, Everybody's Poultry Magazine feels proud that in Hanover, Pa., the home of this Magazine, many prominent Bantam breeders reside, in fact, Hanover has for population more members to the National Club than any locality in the U. S. The following are all residents of Hanover: C. E. Aumen, E. L. H. Haas, T. H. McCausland, E. J. Menchey, C. N. Myers, Mummert Bros., E. G. Norwig, J. H. Sell, J. H. Spangler, C. E. Trone and G. W. Wege.

Pennsylvania fanciers have followed in the wake of a few other of our enterprising States and is in a business like way going after State aid for the Poultry Shows. With the assurance of this appropriation, new interest is being aroused.

The Missouri legislature has a bill before it at the present time asking for an appropriation which would give every organized Poultry Association the sum of one hundred dollars a year, this to apply on cash premiums. We trust that this bill will pass, and that the poultrymen of Missouri will appreciate this to the extent of building their shows to still greater proportions.

The State of Montana allows the State Show two hundred and fifty dollars. An effort is now being made to have this increased to five hundred. Would it not be well, while they are at it to interest the Legislature in making an appropriation which would be sufficient to aid all the shows of that State?

The catalogue being mailed by Mr.

SILVER CAMPINE COCKEREL BRED AND OWNED BY HOMESTEAD CAMPINE FARM WAYLAND MASS.

The above cockerel, winner of second prize at the recent Boston show was a specimen possessing individual merits to be found in only three most carefully bred flocks. He had excellent breast color, considering his purity of hackle, while his wing flights and secondaries were well barred throughout. Although not fully matured when this picture was taken he showed indications of profuse tail coverts of excellent barring and color and should make a valuable breeder. He was a medium sized bird with plenty of style and action carrying a fairly low, well spread tail. The above picture is a faithful likeness and shows a well formed evenly serrated comb and smooth lobes and wattles. (A. O. Schilling.)

M. R. Jacobus, Ridgefield, N. J., is indeed a work of art and is so vastly different from the usual run of publications of this nature, that your attention is immediately attracted. Every Campine lover should possess this book.

To be a good member of the A. P. A. you have already decided that to vote, is a duty to yourself as a member of the organization, as well as a privilege you should appreciate. If all members of the A. P. A. would realize that each one has a duty to perform in this respect we think more harmony would prevail.

The A. P. A. election is perhaps one of the most interesting yet held, and with a contest on for President some electioneering may be considered necessary by the candidates and their friends. With any of the three men elected the affairs of the American Poultry Association are safe.

The writer had a very pleasant visit with Mr. Edwin G. Clark, Manager of Sousa's Band, on the occasion of the bands visit to the home City of "Everybodys". Mr. Clark will eventually enter into the Poultry business, and is a chicken crank of the deepest dye.

This is the time for all Poultry Show Secretaries to plan and build for the success of their respective shows. The shows which prove to be the big ones, and at which the exhibitors flock, are not made in a day. Start now and the results will be more than pleasing.

If a lover of the Wyandotte read every word of Mr. Louis Paul Graham's article, in this issue. Every word has a meaning and the information conveyed will prove of wonderful benefit to you in your breeding.

In a recent number of Poultry Life the editor, Miller Purvis, gives an account of a White Plymouth Rock hen bred by him, that as a pullet won a place in the Portland, Ore., show, was then presented to the Idaho Agricultural College and there made a record of 218 eggs in a year, notwithstanding the fact that taking her to a fair in the fall stopped her laying for six weeks.

Mr. Purvis, who says he keeps only a very few White Rocks, and has none to sell, tells us that this hen is line bred, "no new blood having been used in the strain to which she belongs for about eighteen years. During all this time the original blood has been used, and defective individuals rigidly rejected from the breeding pen".

Idaho bill fails.—A recent letter from State Representative George W. York informs us that the Idaho Foulbrood Bill after having passed both houses of the Legislature, was vetoed by the Governor. This is to be regretted. Idaho is a coming bee country. The earlier the legislation is passed the easier it will be to stamp out disease.

Over 1,500 poultry shows held annually in the United States and Canada and only 208 general licensed judges.

There is a bill before the Wisconsin Legislature to do away with the $5,000 appropriation that has heretofore been used for the assistance of the various poultry shows throughout the state. Every fancier who wishes to be of help to his association and to the industry in this state should get busy with his or her state senator and representative and insist that this movement be defeated.

At the meeting of the Bay City Poultry Association, February 26th, it was decided to speak in the near future on subjects pertaining to poultry, inasmuch as the department of agriculture at Washington is cooperating with organizations formed along the lines of the local poultry association.

Now is the time to purchase your eggs for hatching. Fertility is running high and the eggs are at their best.

The Bourbon Remedy Co., Lexington, Ky., have perhaps one of the most inexpensive, as well as most dependable gape cures ever placed on the market. This medicine is applied to the effected chick in a manner by which the results are astonishing. Hold open the fowls mouth and with the use of a piece of wire touch the entrance of the windpipe, as the pipe opens. When the fowl breathes the medicine reaches the spot at once, this without any bad results to the fowl and brings quick relief. Bourbon Poultry Cure is put up in a concentrated form in bottles and each bottle makes twelve gallons of the cure. Write them for free literature, etc. J. T. H.

Mr. F. B. Williams, Prop. of the West Mountain Poultry cards, Naugatuck, Conn. writes us that after May 1st, eggs from all his select matings of White Wyandottes will be sold at a 30 per cent reduction. Mr. Williams has made a reputation which will stand, and we are pleased to recommend his line to our readers. J. T. H.

The Old Forge Poultry Farm, Spring Grove, Pa., won in the Missouri Egg Laying Contest for November the silver cup for highest laying pen and lead the contest for the month of December, also at the present time are well up among the leading pens. Last year this well established Buff Orpington plant won out in one division of the North American contest, and made a record which has remained a high mark this year.

We hear much of egg records, etc. these days of the strenuous life, but seldom are they so carefully kept as at this ideal farm. Mr. Glatfelter, the owner of Old Forge, is proud indeed of the grand records made by his now famous Bup Orpingtons, and by careful breeding from stock with the laying habit bred in, has produced some wonderful layers, in fact, this line is known as the 230 egg strain. We are pleased to recommend our readers to keep the Old Forge Farm in mind when ever they think of Buff Orpingtons. Mention Everybody's in writing them. J. T. H.

Anyone interested in Indian Runner Ducks should have the neat little catalogue being mailed by Mr. Crockford, Bristol, R. I. This line has produced some wonderful Ducks, their famous Drake, "Wigton" with the record of three blues this season, at Madison Square Garden, New York Palace and Boston, being one of the most remarkable Drakes shown at these shows for years past. Write Mr. Crockford for this catalogue, picturing this grand member of the Duck family. J. T. H.

The Martling Hennery, Ridgefield, N. J. have made such wonderful winnings during the past season that we immediately think of Martling whenever Campines are the subject. Mr. Martling has practically split his price on both stock and eggs in half and is ready to ship you your wants on short order. Mr. Martling has both the Silver and the Golden and of quality unsurpassed. It has been the writers

privilege to personally go over many of this grand stud and we speak with knowledge when we say that here are Campines out of the ordinary. J. T. H.

The Rosemont Farm, Franklin, Venango Co., Penna. sound the truth in a brief but effective way in the opening page of their 1915 catalogue, they say "if you are a fancier we know that you will be interested in our line and if you will read our catalogue with the same care that it was written, placing confidence in us, we feel sure of your patronage, and that to your advantage." This is the method by which this farm has prospered, always trying to please, and sending out quality stock, eggs and baby chicks. They breed White Plymouth Rocks, Barred Plymouth Rocks, White Wyandottes, Sicilian Buttercups, White and Brown Leghorns, Golden and Silver Campines, all the varieties of Ducks, Mammoth Bronze Turkeys, and Pheasants.

THE MARYLAND STRAIN BARRED PLYMOUTH ROCKS

Bred by

Mr. R. J. Walden, Middleburg, Md.

Written by H. P. Schwab.

Maryland always seems beauteous to us, there is sentiment in its name, its clime and in its people. In our National History Maryland has played an important part, just as important has been its progress in manufacture and farming, In breeding it has ever been a leader, vast estates have been mainly used for breeding purposes and the production of the highest quality of Live Stock.

A few weeks ago it was our lot to accompany some friends on an automobile trip from Hanover, Pa., south into Maryland. Our road led through quaint hamlets, settled many more than a hundred years ago, over gentle hills and winding along beside rushing streams when nature was awakening at the approach of the coming spring. The birds had arrived from the far southland in numbers and variety singing their welcome in a way to gladden the heart and to add assurance that life was worth living.

After a forty mile trip and very close to Middleburg, Md., we called on Mr. Robert J. Walden, who like his father and grandfather is a horse breeder. Horses of their breeding and training have won and made millions of dollars, their success is history and to-day as in ages past there is to be seen here some of the most promising and noted horses of the day.

The above illustration shows the 1st Cockerel at the National Meet of the White Wyandotte Club at Harrisburg, Dec., 1914. Mr. Williams, Prop. of the West Mountain Poultry Farms, has made an enviable record with his line. J. T. H.

As we are more adept at writing chicken news than horse news we will now tell our readers that Mr. Walden is also a well known breeder of Barred Plymouth Rocks. He fancies these as much as he does his horses and well he may for he has made his "Maryland Srain" of Barred Plymouth Rocks just as famous as he has his Running Horses and in much less time. We will never blame Mr. Walden for being a Chicken Fancier for we have met his mother who is without question the most interested fancier we have ever met. Mrs. Walden breeds Buff Rocks, White Orpingtons, White Leghorns, Guineas and Turkeys and has also been very successful winning with her birds at Baltimore, Philadelphia and several other shows.

There are a thousand or more acres in the home place with plenty of room for all varieties. Mr. Walden has his buildings splendidly arranged, personally guiding us over his plant and pointing out to our party his famous winners and breeders and giving their history and much special information. Here again was seen his grand hen who has won highest honors in a Dozen Great Classes, others with a long record of victories were also seen. His first prize, Pittsburgh (Club Show) Pullet, also his Philadelphia and Madison Square Garden, New York Winners. This all was most interesting to us. We knew these birds in the Show Room but here at home they looked better than ever. The wonderfully close to ideal shape noted in this line was striking.

The above cut pictures to perfection the 1st Rhode Island Red cockerel at Pittsburgh, Pa. Fanciers Show, and which also won 2nd at the Exposition Show, same city. This male has a long list of winning blood behind him and has made a wonderful record at other shows. Note the length of back carriage, etc. This male owned by Chas. Kiehl, of Williamsport, Pa., heads his best mating. J. T. H.

This with strong bone and good size with the grandest of color and barring was a real treat to us and to our party. We had seen this line before, but never to better advantage than now. Mr. Walden has by far the best line of Stock and Matings he ever had.

In Cockerel Matings Mr. Walden breeds but two or three pens, in these he has also been very successful as his records show. His special efforts are devoted to the female line.

At the late Club Show held at Pittsburgh, Pa., Mr. Walden was one of the two big winners of the show. He won the Club National Cup for best Cock, Hen, Cockerel, Pullet and Pen, and this in the largest and best class we have ever seen at a Club Show. His complete winnings were Cock 2, Cockerel, 2, Hen 1, 2, 5, Pullet, 1, 4, 5, 8, Young Pen 1, Pullet-bred Pen 1. Cockerel-bred Hen 2, Cockerel-bred Pullet 1, Hen 2, Pullet-bred Cockerel 2.

Mr. Walden has given his line his personal attention for many years and his winnings are records made at Philadelphia, Baltimore, Hagerstown, Pittsburgh and Williamsport, and Madison Suare Garden, N. Y., etc. To breed Barred Rocks up to this record means the best possible quality. His success is well earned and well deserved.

Mr. H. Armstrong Roberts, of Beverley, N. J., says: "My flocks, old and young alike are in the pink of condition, which means heavy egg-yield, fertility and vitality. They are all fed a mash containing—

French's Poultry Mustard

Send for a 32 page booklet telling more about Mustard and it's relation to poultry and egg production.

THE R. T. FRENCH CO., Dept. E., Rochester, N. Y.

Making Advertising Pay.

By E. M. Mengel.

A great many people ask the question, "Does advertising pay?" After a few years of almost continuous advertising, I should say that it does pay and pays well.

It is an investment that, when carefully managed pays well. Every good business man knows that to advertise in the right way and in the right place is to do business. Such men as Wanamaker and several other well known business men consider advertising a paying investment. If they did not they would not be spending the hundreds of thousands of dollars that they do for advertising.

Advertising pays the Manufacturer, the Wholesale merchant as well as the Retail merchant. It pays the Business man no matter what line of goods he carries.

It pays the Farmer and Poultry raisers well ds the Business men if properly managed. If you have stock to sell that you know has merit don't hesitate to let others know about it. There are others just as eager to buy as you are to sell, but they will not buy of you unless you let them know what you have to sell. If you were the only person who had any stock to sell probably it would be unnecessary for you to advertise.

Advertising a Necessity.

Advertising is necessary owing to the little fact, "that there are others." The first question to arise it, "How best to do it;" Go at it as you would any other business. Start small and increase gradually as you can afford it. Study the question carefully and if you make a mistake, profit by it and try again starting with the idea that advertising is an investment not an expense. When starting by all means choose a journal or paper along your lines of business. If you have poultry to sell advertise in a good Poultry Magazine and not a Fashion Magazine.

A Poultry Paper reaches just the class of people interested along your lines of things you desire to sell. Select a paper that is well established with a good circulation and reliable. Let this point interest you more than the rate charged for space.

The cost of advertising is not measured by what it costs you alone but what it brings. Some advertising is cheaper at $4.00 per inch than some of it at $4.00 a page. No reliable paper charges a good rate without having a good reason for doing so. Cheap space may be to cheap in the end. That the best is the cheapest in the end is as true as everything else.

One good paper will bring better results than several cheap ones. (In mentioning this I do not want to belittle any Poultry or Advertising medium.)

Importance of Good Copy.

Having selected your Magazine and arranged for space do not make the mistake and crowd to much into the amount of space. Many advertisers are careless in their preparation of an advertisement. They think it all depends upon the paper. This is not so. Here to, the man behind the gun is important. There are some things for which he alone is responsible. Anyone can attract attention but it will not count unless, attracted in a pleasing manner. An attractive advertisement is just as far in advance of a poor one as the Decorated Show Window is ahead of the one filled with last years goods. An advertisement should be arranged with a neat border and some white space.

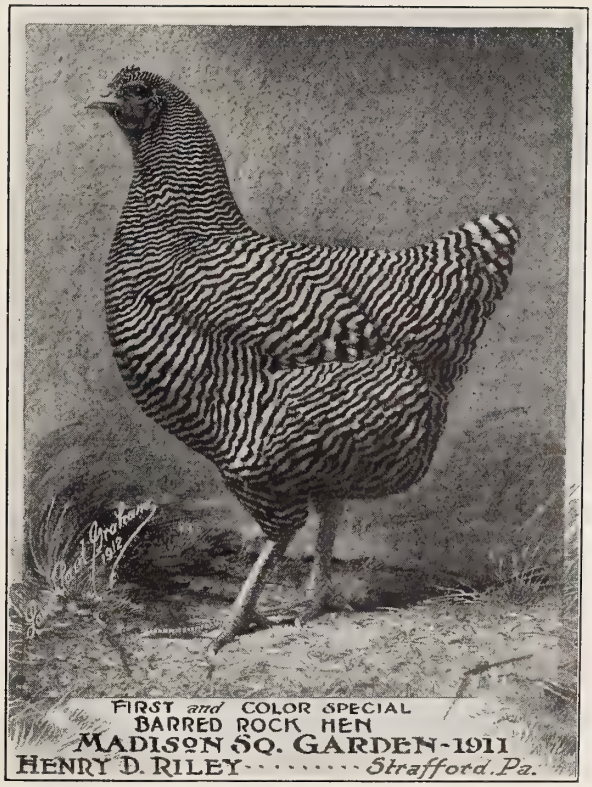
Make your advertisement different from the others. Have a style about it that is all your own. Do not let it be like a half dozen others on the same page. Look over the various advertisements and see the points that please you then plan your advertisement as you would a house.

Make your copy fit the space in a well balanced manner. Making your advertisement just a little different is not difficult but if you think you are not capable of doing it or do not have the time get someone else to do it for you. People are constantly on the lookout for something new and different. They will see it and appreciate it as quickly in a pleasing advertisement as in anything else.

Best Time to Advertise.

The next question comes. When is the best time to advertise? The best time is all the time. Spasmodic attempts do not count for very much in any line of work.

Of course you will see your first advertisement but not everybody else



1st R. C. Rhode Island Red Cock, at both the Reading and Pottsville, Penna. Shows. Mengel's Poultry Yards, R. No. 1, New Ringgold, Pa.

will see it the first time. A few people will see one and a few others will see next one and so on.

It is everlastingly keeping at it that brings results. People think before they buy. Some of them do a great deal of thinking before spending their money. It is a sure thing that they will not think about your stock unless they know about it. They have no way of knowing what you have to sell and how good it is unless you tell them. By all means keep before the Public at all times.

If you advertise only in Spring you will not interest the man that wants to buy in Fall. It will pay you better to use less space during the dull months and use it continually than to use a large space occasionally. It is easy enough to attract attention but it is another matter to hold it. Tell them about the merit of your stock this month and then something different next month or tell about the same thing in a different way, as you cannot interest all the people all the time. I think you would not read a paper that printed the same thing over every week.

Some people have an idea that when they send their copy of their advertisement to the editor all they have to do is to wait for the rush of orders and then it is the fault of the Editor and his old paper.

As a matter of fact the Editor is as anxious for your advertisement to pay you as you are and he will do his part to make it pay, but it is up to you in furnishing the copy. See to it that you frequently furnish a new copy and also that you stick to the truth.

Truth and success are synonymous terms in this matter especially. It is not enough for people to read your advertisements they must believe them. Truth is almost tellable and it always interests someone. There are advertisers that wander away from the truth but there comes a time when their advertising does not pay. Always tell the truth and keep telling it. People are bound to believe you after a while and your advertising will pay.

Remember that every inquirer may be your customer. He probably will be if answered courteously and promptly. Give him attention as if his order was a big one. Go after him and keep afer him, with the intention of selling to him. If your first deal with him is a square one he is sure to come again. Treat your customers so that they will pass your name along instead of down. Fill each order so that it will be like a luscious peach, tasting for more.

After all advertising is a simple matter, it is simply telling people the truth in an interesting way, telling it in a convincing though forward business like way. Tell it often to the right people. Changing your language occasionally just as you do your tone of voice to emphasize certain points and avoid monotony, then treating your customer just as you would like to be treated.

Whether your advertising will pay depends upon yourself a great deal. Go at it with a determination of making it pay and the dollars will be yours.

Schwab Bros., Box E, Irondequoit, N. Y.

It surely must be most gratifying to all members of the National Bantam Association that Mr. George L. Young will continue as Secretary for another year. With Mr. Young as Secretary and Mr. J. George Welch and Mr. A. O. Schillings, President and Vice President, respectively, the association should "boom" with a renewed interest during the coming season.

If a Bantam fancier; surely you should be a member of the National Bantam Association. The year book itself is worth many times the value of a year's dues. The writer has read many club catalogues but seldom has found as much information contained in a single page, as that found in the 1915 Bantam Year Book.

It is regretable that at the last National Meet of the Bantam Association, at Boston, January 12th to 16th, the classes did not come up, in number of entries, to previous years. Why this should be the case we are unable to understand. It surely should be considered by the members of the association and an effort should be made to make the next meeting a large one. Every member can assist in this ,and the National Meet will become what its name signifies, **National.**

It was hardly a decade ago when Bantams were considered merely pets and that an able bodied man should devote much time to their breeding was looked upon as a weakness. Today we have hundreds of men and women making large profits from their Bantams and others depending entirely on this business as a livelihood. Surely it is time to become serious on this Bantam proposition.

Buffalo, N. Y., has the distinction of having a real Bantam Club, with club rooms, etc. Two stated meetings taking place each month. It is organizations such as this, that are keeping interest aroused and building up the Bantam Fancy. We believe if other localities would follow in the wake of Buffalo, next Season's Bantam Shows would show wonderfully increased entries.

If the Bantam breeders of the Country would support to a man, the National Bantam Association, we believe that in the course of a very few years Bantams would become the largest classes in our shows. Mr. George Young, Secretary, is the kind of a man to gain a hearing and with a united fancy behind him, the big and small shows will begin to realize the importance and advantage of encouraging the Bantam exhibitors. First, join the club; then be active in showing your stock.

SHIPPING EGGS BY PARCEL POST.

By Bloomer Bros. Co., Newark, N. J.

It goes without saying that everybody is interested in the safe shipment of eggs by Parcel Post. The only question at issue in the matter, is how eggs can be sent through the mails and delivered at destination without damage. There are many good containers in the market designated for the protection of eggs sent by mail, but it must be obvious to every thinking person, that no matter how strong the container, the eggs, inside, are liable to suffer damage when the mail bag receives a severe impact.

It must be remembered that no particular care is taken by the postal authorities in the transportation of eggs or other fragile articles. They are packed indiscriminately in the mail bags with bottles, knives, metals and other hard substances. The bags are sent to the mail cars piled high on huge wagons. They are tossed about by the men employed, apparently quite regardless of care, and often thrown many feet to a hard platform or pavement. In many small towns or stations, the mail bags are hung on a crane to be snatched inside with terrific force by a fast mail train going 60 or more miles per hour. Does anyone really believe that such an impact does not severely shake every parcel in the mail bag? Assuming that under present conditions of handling the mails, the eggs are quite certain to suffer injury, what then is the remedy?

As manufacturers of egg boxes and containers, we have keenly watched, for many years the development of the project of shipping eggs by mail. Many experiments along this line have convinced us that it is not practical to ship eggs by mail unless under a special mail classification. When the postal authorities place eggs under special classification in the mails, it will mean that shippers will be insured against careless handling, and the shipment of eggs by parcel post made practical and successful.

It seems conclusive, therefore, that the remedy lies entirely with the Post Office Department, and it is quite within reason that the matter will be taken up by the government at no distant day, and the long felt want be brought to a successful issue.

Parcel Post shipment of eggs, successfully established, is a matter that deeply interests every family, and, indeed the civilized world. It is a realization that fascinates the imagination, and will be hailed with delight by millions of people.

THE FEEDING PROBLEM.

Following we give the feed formula used and recommended by the Cornell Agricultural College at Ithaca N. Y. This should prove readable matter and we recommend it to our readers for a thorough trial. We think a great deal of Professor Rice up this way having always found him right and good to follow.—H. P. S.

THE RATION

Mixture No. 1
- 8 lbs. rolled oats
- 8 " bread crumbs or cracker waste.
- 2 " sifted beef scrap (best grade)
- 1 " bone meal

Mixture No. 2
- 3 lbs. wheat (cracked)
- 2 " cracked corn (fine)
- 1 " pinhead oatmeal

Mixture No. 3
- 3 lbs. wheat bran
- 2 " corn meal
- 3 " wheat middlings
- 3 " beef scrap (best grade)
- 1 " bone meal

Mixture No. 4
- 3 lbs. wheat (whole)
- 2 " cracked corn
- 1 " hulled oats

Mixture No. 5
- 3 lbs. wheat
- 3 " cracked corn

THE METHOD

1-5 days

Mixture No. 1, moistened with sour skimmed milk, fed five times a day; Mixture No. 2 in shallow tray containing a little of No. 3 (dry) always before chicks. Shredded green food and fine grit and charcoal and scattered over food.

5 days-2 weeks

No. 2 in light litter twice a day. No. 3 moistened with sour skimmed milk, fed three times a day; No. 3 (dry) always available.

2-4 weeks

As above, except that the moist mash is given twice a day.

4-6 weeks (or until chicks are on range)

Reduce meals of **moist mash** to one a day; Mixture No. 4 in litter twice a day: dry mash always available.

6 weeks to Maturity

No. 3 and No. 5 hopper fed. One meal a day of moist mash if it is desired to hasten development.

Further Directions.

1. Provide fine grit, charcoal, shell and bone from the start.
2. Give grass range or plenty of green food.
3. Have fresh, clean water always available.
4. Feed only sweet, wholesome foods.
5. Avoid damp and soiled litter.
6. Disinfect brooders frequently.
7. Test all beef-scrap before feeding.
8. Keep chickens active by allowing them to become hungry once daily.
9. Feed moist mash sparingly.
10. Keep dry mash always before the chicks.

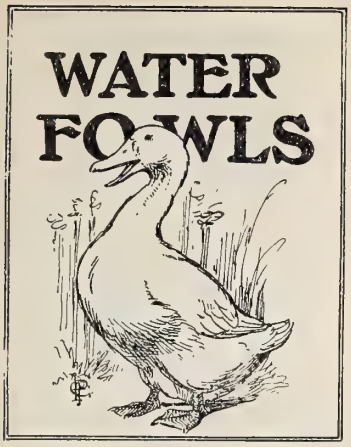
Caponizing is not difficult, anyone can do it. You can make money caponizing for others. *Write today for our free Capon Book.*

G. P. PILLING & SON CO.
23RD AND ARCH STREETS PHILADELPHIA, PA.



By Mrs. W. P. Maston

The raising of Ducks and Geese is part of the poultry industry. Thousands upon thousands are marketed annually and many show specimens bring from $50 to $150 each.

It has been stated on good authority that the profits to be derived from ducks, when raised for market purposes, should be about $2.00 or more per head, each year, when scientific methods are used in the breeding, in the care, and in the feeding of ducks on a large plant, counting all cost of labor, feed, losses, and interest on the capital invested. This I cannot confirm or deny, as I have not had the experience in conducting a large plant, but if this be true, one can easily see the profitable side of the business.

However the raising of ducks for market purpose, on a large scale requires a big investment and much experience. I would advise no one to undertake this work, not having studied and learned every detail of the business before making a start. But the amateur who desires to start in a small way, may make a success if he or she remembers a few fundamental rules that go along way toward making a success with water fowl.

As ducks require different care from geese, I will take each separately.

Advising the amateur to go into the business in a small way at the beginning, the next thing to be considered is the variety or varieties one wishes to keep. We have fifteen Standard varieties of ducks at the present time, three new varieties having been admitted to the Standard of Perfection at the last meeting of the American Poultry Association; viz, White Runner Ducks, Pencilled Runner Ducks and Buff Ducks.

The word "Indian" has been dropped from the varieties known as White Indian Runners and Pencilled Indian Runners, also the word "Orpington" has been dropped from the variety which has been known as Buff Orpington ducks.

The Pekins are in the lead as a market duck and are fairly good layers. They probably are bred more than any other variety, but there are other varieties, in my estimation, equally as food as the Pekins, and much better for home consumption.

The Rouen, Cayuga, Muscovy and Aylesbury are all excellent table ducks.

It is to be regretted that so few Cayuga ducks are bred. In fact they are becoming almost extinct. This variety is considered by all epicures to be par-excellence. Certainly it is a most excellent table duck, but it will never be popular as a market duck on account of its black plumage.

All Runner ducks may be classed in the "Mediterranean" class, as they are bred mainly for their laying qualities.

White Runners are becomming quite popular and some typical specimens were shown at Boston and New York this past winter.

The Muscovy duck does not mature so rapidly as the Pekin, but this variety can be raised on about half the feed that other ducks require. This breed possess flesh of fine flavor. Many people object to the quacking of ducks, so here is a variety for nervous people—the "noiseless Muscovy."

The Buff Orpington duck is coming into popular favor and this variety is of good size and are excellent layers of large eggs.

The Crested White are of good size also a little lighter in weight than the Pekin and are very attractive on a pond of water. They have much in their favor—beauty and weight and are extra good layers of large white eggs.

The Gray Calls, White Calls and East Indians are the "Bantams" of the duck family, for the smaller they can be bred the more valuable they are for "show" specimens. These varieties may be classed in the ornamental" class. They are well suited for the "fancier" who has not accomodations for the larger breeds. If a pen of these could be moved on fresh grass every day, in a small wire run, five or six yards long and one or two yards wide, with a small coop at the end of the enclosure, they would thrive exceptionally well. They will lay fairly well under these conditions, but of course would do better if they were allowed free range.

Having decided upon which variety or varieties of ducks you wish to start with, the next course is to purchase first class stock. I would not advise buying eggs but would begin with a trio or pen of first class birds. Debilitated and degenerate stock will never produce healthy young ducklings. The eggs from poor stock are generally few in number and mostly infertile. The young are sickly and few ever reach the market or mature age. It is therefore of the greatest importance that we lay the foundation of our stock in the best possible manner.

In selecting ducks, do not purchase old birds, or those over two years of age, as it is a waste of money, unless it be the Muscoy ducks. They live much longer than any other variety.

Many specimens which have good records in the show room, readily bring from $5.00 to $75.00 each for use as breeders, but it is not always the show bird that produces good stock. Select ducks that are strong, vigorous and have stamina. Ducks that have bright eyes, slick plumage and are alert and active are the healthy ones. Therefore, only those flocks that have hatched well and successfully and have been kept growing to maturity are suitable for breeders. The same rules that apply to the selection of fowls, apply to ducks; viz, strong, vigorous birds, well formed and coming as near to the Standard of Perfection as possible. If you are not a good judge of the variety of ducks, and you wish to purchase, better leave the selection to some reliable breeder.

QUESTIONS AND ANSWERS.

In this department we will answer questions, pertaining to poultry. It is for the free use of our subscribers. When special information in regard to diseases, etc. is desired, same will be funished by mail to avoid delay. Ask your questions, let us help you.

MR. HARLO J. FISKE.

We have just learned that Mr. Harlo J. Fiske, the successful S. C. White Leghorn breeder, who recently sold his entire stock of birds to Mr. Stewart Haddock, of the Grannock Farms, Poughkeepsie, N. Y., has accepted the management of the Laurelton Farms, Lakewood, N. J.

Considering, this is a great piece of news, we wish to congratulate the owners of the Laurelton Farms upon securing Mr. Fiske as their manager. We consider him one of the most capable men we know of, both as a manager and as well as a breeder.

To Mr. Fiske we also extend our very best wishes for his success, feeling assured of this. H. P. S.

CHAS. A. CYPHERS.

The neat and attractive circular which is being mailed by Chas. A. Cyphers, 484 Dewitt St., Buffalo, N. Y. is the actual experiences of how one man succeeded in poultry keeping and this beyond the conception of many. Mr. Cyphers is one of the best authorities on incubation in this country today, and the manner in which he writes this true and interesting story is of untold interest to all poultry lovers. Write for this free booklet.

THE ORCHARD FARMS.

Noroton Heights, Conn.

The Orchard Farms Single and Rose Comb Rhode Island Reds are a line always to consider when the best and highest quality is desired. Mr. H. L. Mapes, the owner, has made a study and a success in breeding this variety that is second to no others. His this season's winnings at the Pittsburgh Exposition Show as well as at Madison Square Garden New York and other shows are the real high spots and quality tests for all varieties alike.

We were particularly impressed with his winnings and the line of birds he won about all the prizes offered in both varieties, also all the specials.

For this season Mr. Mapes has mated his birds with greatest care and with reason for the assurance of grand results. He will be glad to hear from the readers of "Everybodys" and will furnish them with his list and any special information wanted. H. P. S.

THE PENSYLVANIA STAMPING CO.

The Pennsylvania Stamping Co., of York, Pa., manufacturers of the Keystone Drinking Fountains, for poultry and pets of all kinds, have some thing a little out of the ordinary in poultry supplies of this character. A neat little folder, fully describing same, will be mailed by them on request. These fountains are so reasonable in price, as well as of so simple and durable construction, that they will appeal to all. Write them, mentioning Everybody's.

NIEMANS POULTRY FARM.

Niemans Poultry Farm, located a few miles from Buffalo, N. Y. is a unique poultry farm indeed, in that in addition to a fully equipped poultry plant, with incubators of thirty thousand egg capacity, consisting of both Hall Monmouth and Cyphers lamp heating machines, they are agents for several makes of incubators, brooders, etc.

Mr. Harry A. Neiman, is personally in charge of the farm and has spent years of careful study in the perfecting of his business.

Thousands of pure bred ducks and chickens are raised on this farm, as well as Geese and Guinea fowls.

Day old stock, as well as hatching eggs of all the popular varieties, are to be had here. Write them, mentioning Everybody's.

BIRD BROS.

Catalogues and Mating Lists can be made very interesting or can become very tiresome. Therefore, when a list such as that mailed by Bird Bros., Myersdale, Pa. reaches our desk, we find pleasure in reading and looking over the grand illustrations, etc.

The winnings made by Bird Bros. on their famous Partridge Plymouth Rocks and Giant Bronze Turkeys are known by every poultryman in America. These wins have been consistent and made where the competition was the keenest. Madison Square Garden, Chicago and Pittsburgh are scenes of their late winnings and are only a continuation of the winnings started at the Garden in 1910.

Perhaps one of the finest Partridge Rock males ever shown was "Highland Chief" first cock at Pittsburgh and third at Madison Square last season. This bird is reproduced on their cover page of their catalogue and being taken at his best makes this cover a beauty. We cannot go into detail as to all the interesting things contained in this very interesting catalogue but suffice to say, Bird Bros. are leaders in their line.

It is a pleasure for Everybody's Poultry Magazine to recommend Messrs. Bird Bros. and we trust that in writing them you will always mention this magazine. J. T. H.

VOICE OF THE PEOPLE.

This department is for all matters of interest. Our readers are requested to send us such items of value and interest, also comments on questions of the day. All join in and make this a live proposition.

FRENCH'S POULTRY MUSTARD.

Of the numberless uses of mustard there is probably none that has more of a beneficial effect than that used for poultry. Experience and experiments have proven it to be one of our best foods. It can be safely taken from the field of condiments and the like and called a food, for unlike spices, drugs and so on it does not leave any bad effects if properly used. It has never come to our notice that mustard is harmful to either man, beast or fowl, therefore, it ought to, just from a common sense be free from anything detrimental to chickens

It does not seem to be confined to anyone particular use either. E. B. Thompson of world renowned Ringlet fame says he believes its use adds vigor to the birds consequently increases fertility. Certainly a most desired thing. Increased vigor would also indicate better and stronger chicks. Mr. D. O. Skillen says he finds it particularly fine as an "inducer" to laying and also laying more eggs. Zach. Snyder finds that properly fed his chickens moult quicker and are healthier and happier than without it.

Today we find "French's Poultry Mustard" in general use among the poultrymen, every one of them knowing its economic value. The fanciers and breeders of fine poultry use it for the results it has given in better plumage, greater fertility and the best of general results, while on the great egg farms it has become a regular food, it having been satisfactorly shown that hens do lay better, that more egs are being produced by its use, and that it is a real necessity where the best of results are hoped for.

It seems that the English were the first to regard mustard as one of the necessary adjuncts to good poultry keeping and like all good secrets this leaked out and came over here. It did not take that progressive firm, the R. T. French Company, of 167 Mustard street, long to place upon the market a superior article in this line, for this concern has been thinking mustard twenty-four hours a day for a good many years now and what it does not know about mustard is not worth knowing. They have gotten out a very fine production that should be in the hands of everyone keeping chickens, for it tells all about mustard that you should know.

Really it is a blessing that we in this country should have such a concern and such a mustard as this firm turns out. We know, for we have tried it and used it ever since we started. It is for your success that we recommend it to you. Better write for the booklet right away. G. J. O.

BROODER

For $2.96, including heater, you can build the simplest, most efficient, and most satisfactory brooder made. Wind-proof; fire-proof; rat-proof; fool-proof. Can be built in an hour by anyone with no tools but saw and hammer. Illustrated plans, 25c.

I. PUTNAM, ROUTE 115
ELMIRA, N. Y.

American Poultry ASSOCIATION.

E. B. Thompson. President,
S. T. Campbell, Secretary,
Mansfield, Ohio.

Reorganization of Branch Associations.

It is the desire of the Association that the former branches, now to be known as state and provincial associations, shall hold their annual elections for state and provincial officers at the same time and in the same manner that the American Poultry Association elections are held.

Many states, where two or more poultry associations existed in addition to the branch, have been successful in having the several state organizations federate under one name, thus doing away with rival state organizations.

Several classes of membership are provided for under the system of reorganization, and for this reason members elected to official positions should be qualified to take up the work of reorganization in the various states and provinces, and of adopting constitutions that will conform in a general way to the Constitution of the parent body.

In the state associations members are to be enrolled on the annual dues basis, the amount of the dues to be fixed by the state and provincial associations. Oklahoma, Kansas, Ohio, Pennsylvania, and other states have made creditable progress by holding meetings, adopting constitutions and enrolling annual members. Many states are providing for country membership, believing that in order to promote the poultry industry, county organizations are necessary.

The state associations will offer suitable medals and diplomas to county organizations, to be competed for by the annual members. In many states there are counties in which a poultry show has never been held. This condition should not longer be allowed to exist. There is a wide field for work in all states and provinces; and under the new Constitution of the American Poultry Association if the state and provincial members will make the proper and reasonable efforts, poultry interests will be well organized, and every branch of poultry culture represented.

SCIENTIFIC FEEDING.

"Over half a century ago, the late James Spratt an American, realizing the importance of a sound farinaceous food for both Dogs and Poultry, established himself in business in London.

The demand at first for food of this description was small but, like all slow growing businesses, the rate of increase has been consistent year after year until eventually the business established by James Spratt grew to immense proportions until subsidiary companies and branches all over the world. Of late, increased attention has been bestowed upon the question of Poultry Rearing and it is daily becoming a subject of greater importance. The question of scientific feeding or, in other words, the best method of getting the best results at the least cost is the dominant thought in the mind of every breeder. Losses must be eliminated and leaks must be stopped.

Unfortunately, a number of fanciers make the common mistake of feeding their fowls upon mixtures that contain little or no nutritive properties and injure their hens by too frequent use of condiments that induce inflamatory conditions and thereby effect the health of the flock, consequently the supply of eggs is decreased by the premature decadence of the hens and the number of table birds is reduced. On the other hand, there are thousands of instances where the flocks are regularly fed, every morning, on Spratt's Poultry Food No. 3, a specially prepared cooked food which is used by the majority of the successful exhibitors of the day and fed at most of the principal shows, the fowls are kept in sound condition and health.

This food is specially adopted for promoting a steady yield of eggs and is strongly recommended for this purpose during the laying season, whilst Spratt's Poultry Spice (Cardiac) added to their soft food during cold or damp weather, or given to hens or pullets about to commence laying, is not only an infallible egg-producing stimulant but a perfectly safe one to use.

With the advent of the hatching season the food question becomes one of still greater importance. It is difficult to convince everybody that Spratt's Chick Meals Nos. 5 and 12, if fed according to directions, will reduce the percentage of mortality to a minimum but, in view of the fact that 95 per cent of the mortality amongst young chicks can be traced to improper feeding, the advantage of using a food which is so easily assimilated and digested becomes apparent at once to the most casual observer.

The general consensus of opinion is that in order to rear birds successfully a carefully blended mixture of nourishing grains must be given heating foods such as cracked corn should be carefully eliminated. Poultry Raisers will find Spratt's Chicgrain is an ideal starting food. It contains no corn but is composed of the necessary ingredients for building up a strong and healthy frame. All indigestible grains have been eliminated.

Those who wish to obtain further information in regard to Spratt's Foods cannot do better than to write to Spratt's Patent, Newark, N. J. for their pamphlet, "Poultry Culture" which is a 10c publication but will be mailed free to readers of Everybody's Poultry Magazine who send Spratt's their names asd addresses within the next two eweks.

"OCULUM" STANDS A 5 YEAR TEST.

Salem, Va., March 26, 1915.

H. I. Co., Inc.,
Salem, Va.

"When you first started to advertise "OCULUM", you offered 8c a pound for sick chickens, ducks and turkeys suffering from Cholera, Roup, White Diarrhea, Sorehead, Blackhead, Leg Weakness and kindred diseases—for the purpose of testing its merit.

On October 21, 1910, I sold you a black hen and a white rooster, having Cholera in its worst form on which you made a most successful test before the leading citizens of Salem, Va., your home town, and on Feb. 11, 1911 these citizens gave you a testimonial.

It has been my privilege to watch these two birds since this test was made. They have been kept with sick chickens all the time.

The hen was killed November 7, 1914, having become dropsical from old age. The rooster I examined today; he is perfectly well and his comb is as red as blood.

Curing these two birds with "OCULUM" was wonderful, but keeping them with sick chickens for years and keeping them healthy all the while with "OCULUM" is truly marvelous".

O. D. Oakey, Prop.,
Camden Iron Works.

P. S. Any poultryman who reads the above testimonial on "OCULUM" and then does not try it, will have himself to blame for his future loses. Prejudice cannot stand before such knowledge.

THE "SUCCULENTA" TABLET.

Mr. Poultryman, do you realize that it is mineral salts a hen craves in green food?

Succulence in any of its bulky forms (grass, sprouted oats, beets, etc.) is composed principally of water, fibre and mineral salts.

All poultry authorities agree that of the constituents of green food, fibre is not only unnecessary but actually harmful to fowl, and especially so to little chicks. In the government report of the department of plant and animal chemistry, fibre is mentioned as one of the harmful elements that reduces the standard of various feeds.

Fibre cannot be wholly eliminated in these feeds, but its percentage is decreased by milling. Fibre, on the other hand, cannot be eliminated at all in succulence in bulk, but it is totally absent in succulence in the tablet form

The two true elements of green food are obviously water and mineral salts. Water the fowls should always have at hand and; the mineral salts can be readily added to it through the medium of the Succulenta Tablet.

For the first time in the industry of the poultry world, the necessary mineral salts are available in tablet form, owing to a process for binding these salts together, discovered by an eminent German chemist.

Think, Mr. Poultryman, what this discovery means to you. Simply dissolve the tablets in the drinking water and forget about green food.

Succulenta Tablets save bother, time, labor and expense. Sold on the money back plan.

CHAS. A. CYPHERS.

One of the most interesting pieces of reading matter which has reached our desk in a long time is that which will be mailed you for the asking by Mr. Chas. A. Cyphers, 484 Dewitt, Buffalo, N. Y. This is an actual occurrence of how one man made good in the poultry business, starting on nothing and building a business which is the envy of many. In this pamphlet, which deals with the success of this little farm, consisting of two city lots, Mr. Carter, the owner, attributes his success to his start with the Buffalo Incubator, using entirely this firms make of both Incubators and Brooders. Better write Chas. A. Cyphers at above address, requesting a copy of this interesting booklet. J. T. H.

CHARCOAL FOR CHICKS.

We call your attention to the advertisement on another page of this issue of the Thomas Keery Co., of Hancock, N. Y., producers of granulated charcoal. Using the best of hard wood, principally maple, gives them a fine grade of charcoal.

This product is a wonderful absorbant and purifier and should be always found before poultry, both chicks and adults. Many cases of disease arise from the fact that charcoal is not being supplied.

This Company furnishes their product in the marketable sizes, adopted for both young and old stock. Write them for further information, mentioning Everybody's. J. T. H.

CAN'T BEAT THESE HATCHES

J. R. Allen, Portsmouth, Ohio, got four 100% perfect hatches from his Progressive Incubator this year. Simplest, safest, surest hatcher made. Heating system regulates itself. Hundreds of dead air cells protect eggs against sudden changes and insure big hatches.

$7.35 LOWEST PRICE YET For 155 EGG INCUBATOR

Money back with 8 per cent interest if it don't make good. *All wood parts genuine California Redwood.* Copper boiler. Perfect hot water heating system. Double disc temperature regulator. Heavy safety lamp. Nursery. Double doors. Strong egg tray. Accurate thermometer. Egg tester. Shipped complete, set up, ready for use, for $7.35. Freight prepaid east of Rockies. Incubator and Hot Water Brooder both $9.85. Order now or write for Big Free Incubator Book.

PERCHING BIRDS.

Incessores or Passeres

These birds are of smaller size than those of the other orders. Naturalists regard them as exhibiting, in the highest degree, those properties by which, as a class, are distinguished.

So many are the variations of form and structure which are found in this group, (about equaling in number that of all the other orders taken together,) that but few positive characters can be assigned, which are common alike to the whole group and to a particular division. Its distinctions are mostly negative for the group includes neither swimmers, waders, nor climbers, neither rapacious nor gallinaceous birds; and yet, by comparing the various tribes which it includes, a general resemblance of structure becomes apparent.

These birds have the power of grasping the branches and twigs of trees with their feet, and are accustomed to rest upon them; hence they are called Perchers; the hind toe is always present and placed on the same level or plane as those in front; and the claws are incapable of being raised as in the Birds of Prey. The larger portions of the species usually dwell in the woods and the thickets. All have the faculty of flight in full perfection, and in the Swifts and Humming Birds it may be regarded as at its highest development. The beak in the Perchers differ greatly in form, but its common shape is that of a cone, more or less lengthened. In some of the genera a notch appears near the tip of the mandible, indicating some affinity for the habits of the Falcon tribe; but this generally disappears in the others.

The food of these birds is various in its kinds; but by far the larger part feed either upon insects or the seeds of vegetables, which they almost always procure by the beak alone.

This order has peculiar interest as including the sweet songsters whose soothing influence is so widely felt and acknowledged.

The larynx, or organ of voice, is in these birds always of complex structure, so that there are few of them that do not, during the pairing season, either sing or utter some peculiar note or chatter analogous to song.

The instinct of birds in building their nests, is in those of this order most strikingly displayed. Admirable indeed are the compact felted nests of the Humming-bird, of the Goldfinch or Yellow-bird, and of the Bottle-titor Penduline Tit-mouse, and the woven, purse-like nests of the Orioles and the Startlings.

The Perchers always live in pairs; in general, the female is smaller and less brilliant in her plumage than the male. The young leave the egg in a blind and naked state, and for a while are entirely dependent upon a parental care for their subsistence.

For convenience, this large order has been arranged into four tribes or sub-divisions, founded on the varying form of the beak.

NOFTZGER PARTRIDGE PLYMOUTH ROCKS.

We are in receipt of a neat little booklet, describing the Partridge Rock Matings of Mr. S. F. Noftzger, North Manchester, Ind. One of the originators of this popular and well known variety. This booklet describes his forty matings for the 1915 breeding season, and are an interesting lot to consider by all who breed and fancy this variety.

In this, we wish to call your attention to Mr. Noftzger's special egg offer, whereby you can purchase fifteen or more of his best eggs at a reasonable price. His eggs are listed up to $25.00 per setting. From the description given, we believe that Mr. Noftzger's line is a reliable and worthy one, having judged his birds in the past, and having seen them in our very best shows.

We also note, that he has a utility flock containing many high class specimens. The male birds in this flock are all classy individuals large size, big boned, rich in markings, and of the most aristocratic blood lines, are those in his select pens. The females in this flock are of the same quality, selected for their blood lines, excellent type beautiful markings, and their great egg records.

Mr. Noftzger is offering from this fine flock, at a most liberal and reduced price, eggs at $2.00 per 15, or $10.00 per hundred eggs. If interested, do not fail to write Mr. Noftzger at once, asking for his full list, and any other information you may wish.

When writing, please mention Everybody's.

GRAHAM'S CRACKERS

By LOUIS P. GRAHAM, Vineland, N. J.

Some folks take Link Orr too seriously. When he penned his famous or infamous (choose your own words) views on placing blue ribbons on an otherwise fine specimen, regardless of a bit of down on the legs, or between the toes, he did not know that this would lead a well known judge to absolutely ignore about fifty stubs and feathers on a clean legged fowl and place the ribbon thereon, as was done at the recent Garden Show. It was the joke of the show and certainly proves that Link's advice was to say the least demoralizing.

Our four contemporaries in reviewing the classes at Madison Square Garden noted that there was very little kicking, it being confined chiefly to the Barred Rocks and White Leghorns. Piffle, that's a bad guess. There was no kicking in Barred Rocks, even the "undertakers association" expressed approval of the awards. I did see a blue cloud hovering over the Partridge Wyandottes and Partridge Rocks, however. Under what was that?

In all Partridge colored fowls and Silver Penciled too, green sheen on the black penciling is a decided out. It corresponds to "bronzing" in Barred Rocks and "brassiness' in white fowls. Why do some judges overlook this defect in the Penciled breeds, when they slam thunder out of its sister defects bronzing and brassiness?

Every popular breed soon has a "Trailer" which is obviously originated and advertised to catch some of the money that ought to be spent on the reliable variety. Witness the White Campine, it has yellow legs. Undoubtedly a bunch of scrub Leghorns, also the Rhode Island Whites, trading on the great popularity of the Red. I have yet to see a so called Rhode Island White that possessed anything like the Red shape. They have all been more like scrub White Wyandottes.

Up to something over two years ago, old poultrymen and some of the newer ones, who had enjoyed a slight touch of the friendship and the comradeship of the justly famed "Old Guard", sighed for the good old timers again and bewailed the passing of the men of which this group was composed. It was freely predicted that the type of men being attracted to the fancy, was too commercial to form a new ,'Old Guard".

Many of us did not share this opinion. The "Old Guard" was not a set organization but simply a group of good fellows and strong men who had long been identified with the breeding of poultry and with poultry shows and had built up our fancy to what it was about five years ago.

These men were products of the day when the A. P. A. numbered about sixty members and to-day it is over six thousand. Then everybody knew every other man personally. To-day this is impossible. In the meantime little cliques had sprung up in the fancy, limited to the breeders of each variety. Their acquaintance outside of their fellow breeders was very limited, chiefly newspaper representatives, supply men and the artist (those whose business it was to know all men). When one of the Red Breeders left the Red isle in a big show, he was lost and unknown and any of the Leghorn or Rock men which chanced to meet and vice versa.

To-day all is changed. There is a community of interest between all classes of men in the show room and all breeders come very close to knowing all the others, even though they do not breed the same variety. This great factor for social and fraternal intercourse has been the order of Fleas. The button of this order is as much of an introduction between poultrymen as is that of the Elks or the Masons and its annual banquets, held in connection with each show is a feature less formal and in many cases more appreciated than the regular spread furnished by the poultry show management.

Certain it is that these occasions have formed many new friendships and been the source of many pleasant memories to those who have participated. Many will recall with pleasure the splendid attendance and good fellowship of the banquets held in the past show season at Philadelphia, Pittsburgh, Madison Square Garden, Williamsport and looking backward a little to Boston and Baltimore as well. It is safe to say that all are anticipating a repetition of this "good" night at the shows next season and many more will be there for no poultryman in breeding and remain connected with this business can afford to overlook this opportunity in meeting the "high lights" and good fellows interested in the formation of the business of breeding poultry.

The history of the order of the Fleas is like that of many orders which are to-day strong and respected. It has had its ups and downs, mostly downs, chiefly through a lack of knowing just which was the right way to proceed but its organization is to-day in the hands of strong men, men who have profited by the errors of the past and under their guidance, the order of Fleas is bound to become more firmly established and a power in the world of poultry.

There are no politics connected with this order ,it is in no way either a side issue of or competitor of the American Poultry Association. It does not pretend to meddle with the business of the day, but it is a factor for the promotion of good fellowship among poultrymen, North, South, East and West, and has already accomplished results, in this line which has stilled the yearning cry for the passing of the "Old Guard". This is the new "Old Guard" and its button is self introducing. It has upwards of a thousand members and its influence has spread as far as the Pacific coast, with branches in Foreign Countries.

EDWARD W. KIBBEY, Patent Attorney.
517 Victor Bldg., Washington, D. C.

Many people talk glibly of utility fowls and utility quality, when they mean eggs and egg production only. This is by no means the meaning of the word utility as applied to fowls. Utility means the production of eggs in quantity when eggs are worth a fair price, not in Spring when any old hen will lay and eggs are lowest priced. It also means a chick that is capable of growing rapidly on ordinary feed to a reasonable and fair size for market. It also means the hen which at maturity and when her egg laying is at an end, shall sell for a fair price from the butcher stall. Such a fowl is not then the Leghorn as our rabid commercial poultryman or so called utility poultryman would have us believe. Fowls of the type of our American class are the kind that will fill this description. They produce winter eggs without the use of high priced and costly feeds. Chicks make rapid growth and are salable at all ages at this price and the mature fowl weighs from two to three times as much as a Leghorn.

On large egg farms in June, when one-third the layers are to be marketed to make room for pullets, the White Leghorn plants must be satisfied with small prices and a slow market at from one to two cents a pound less than prices offered for Wyandottes, Rocks, Reds and Orpingtons. Besides the poundage per hen is something to be considered.

Taking all facts into consideration our utility men and the Agricultural writers who are arbitrarily building a "Utility versur Fancy" split among the breeders are a poorly informed lot of men and must remember when souring at the fanciers that it was these very fanciers who by their foresight in creating real utility qualities (a combination of egg production and meat as well). In the American type fowls shown that the real advocates and supporters of real utility are the fanciers alone.

This country has gone "utility crazy". About the only measure of a hen in vague to-day is its capacity for egg production, regardless of any other qualities of meat or beauty and any kind of shape of hen will do, just so that it lays two hundred eggs a year or thereabouts. The worst of it is, these commercial fellows have the imprudence to dub some of these hens as pure bred fowls. The class of English fowls which are termed Wyandottes and Leghorns are nothing of the sort. "Shape makes the breed and color the variety." These English fowls are simply Rose and Single Comb laying hens, that's all. Take away their egg records and lose their identity somewhere in the country and to all passers by they will be only farmers Dunghills, which indeed they are. They correspond to "grade cattle" and every thinking man discards grade and gets pure breds just as soon as he is financially able.

These fresh importations of English fowls are making good egg records in some cases are slightly ahead of our American bred fowls but recently a Canadian re-stated a fact which is well known. The climate and soil of England is particularly suited to produce great size and an increase egg laying in all varieties and quoted the notable increase in size, etc., of our American varieties after being bred for a few years in England.

The reverse of this is also true. After a few generations in America these English fowls drop off, not so much in size as in egg production and these breeders who are going to use any of these much exploited English fowls for eggs will find it necessary to make frequent and regular importations of stock. Otherwise, after a few generations a very noticeable falling off will occur in a total of eggs produced in a year.

Problem: If white eggs in Winter are worth 78c a dozen and brown eggs 68c and your five hundred hens are producing about five white eggs a day, while your two hundred and fifty brown egg hens are producing about 40 per cent production and this same condition maintained until February first when all eggs reach nearly an approximate price. What is the advantage of breeding for white eggs?

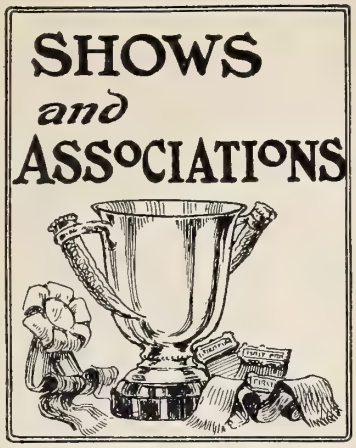
SWORN TO and subscrbied before me a notary public in the County and State aforesaid on the 3rd day of April, 1915.

ALVIN R. NISSLY,
Notary Public.

My commission expires March 8, 1919.

This statement should have appeared in the Aril, 1915, issue.

Year by year first prize Single Comb White Leghorn cockerel at the Madison Square Garden, New York Show has been won by Mr. D. W. Young, Monroe, N. Y. We do not remember when anyone else won this prize last. Each year Mr. Young has shown several capable birds and each year no matter how good the average, he has always come along with a number that have stood out strong in every quality and with merit worthy of championship honors. His 1915 winner here shown was of a class to look forward to with confidence for more to follow. H. P. S.



YORK, PENNA. SHOW.

The Southern Breeders and Fanciers Association will hold their second annual exhibition in York, Penna., week of Nov. 30th. Several interesting meetings of this association have been held during the past month, at which plans have been outlined for this season's event.

No section of the Country has more fanciers therein than this beautiful section of the Keystone State. With Mr. Philip Glatfelter as chief "rooter" backed by such able officers as the followers, great things can be expected in the way of a first class exhibition at York, Penna. on above dates. The following constitute the make up of the organization. Mr. G. B. Blasser, President; Dr. Charmbury, Vice President, Chas. C. Shirk, Treasurer with Mr. Leon Berg as Secretary.

NEW YORK STATE FAIR.

We have just received word that the Hon. J. H. Harriman, Commissioner of Live Stock, has appointed Mr. Wm. H. Manning, Superintendent of the Poultry and Kennel Department for the New York State Fair. We congratulate Mr. Harriman on this appointment which is bound to meet with general approval.

Mr. Manning has served in this capacity for the past two or three years has proven himself very efficient and has made this one of the two largest and best Fall Shows in the country.

The N. Y. State Fair will be held during the week of September 13th, 1915. List of judges and other information will be given in our next.

As we are going to press, we have just received word through Mr. K. M. Turner, Vice President of the American Campine Club, that by a unanimous vote of the executive board of this Association, Mr. M. R. Jacobus was elected President. We know of no man in the field to-day whom we believe will give the position more dignity than Mr. Jacobus. We also predict greater prosperity, as well as renewed activity in affairs of the American Campine Club.

Rochester Poultry Association.

The Flower City Poultry Association, of Rochester, N. Y. held their anual meeting and elected the following officers. President, Mr. Fred O. Guenther, Vice-President, Mr. August Eckert, Secretary, Mr. J. W. Chapman, Box 554, Rochester, N. Y. Treasurer, Mr. John F. Talling er, General Superintendent, Mr. Chas. C. Palmer.

At this time the following judges have been selected for their next show which will be held the week of January 27th to February 3rd, 1916. Mr. Chas. H. Welles, Charles Nixon, Haldie Nicholson and W. G. Minich. Others will be engaged later.

The National Polish Club will hold their annual meeting in connection with and during this show, other meetings are expected and will be announced later.

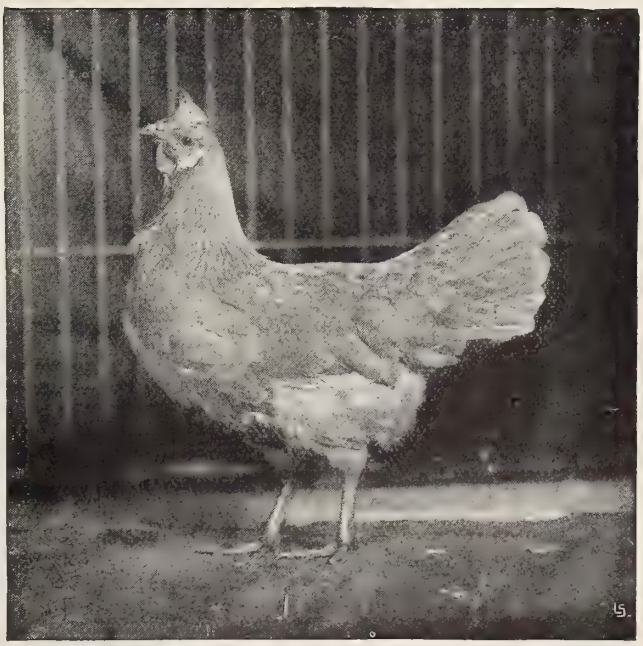
This association has held several fine and large shows of quality, they have one of the largest and best halls in the country. They are perfectly reliable, and responsible and deserve the support of every breeder.

Golden Wyandotte Breeders and Fanciers, Take Notice.

During the past eight years we have had two clubs and both have faded away into history, but while they existed they did much for our favorite breed.

A new club has been organized for the advancement of the Golden Wyandottes and steps have been taken to make our new club a permanent organization. We earnestly solicit the co-operation of all live breeders and fanciers. We must work together. Let's get behind the club and help put our favorite breed in the front rank, which it justly deserves. A National Show for 1915-16 is now on foot and greater benefits to all members and the breed will follow, but just now we need your help. It is going to take some money to work out our plans as outlined and we need your $1.00 dues. Let each one do his part. Join at once and then help secure as many new members as you can.

J. S. Pennington, Plainfield, Ill., Pres.
A. W. Lang, Dayton, Ohio, Sec'y.



Not retouched. The hen shown above belongs to Dr. L. A. Heasley, Holland, Mich. As a pullet she won 1st at Kalamazoo in January, 1914, and 2d at the Great Chicago Show, January, 1914. As a hen she won 1st at the Chicago Coliseum Show, December, 1914, and 1st at Grand Rapids, January, 1915. Dr. Heasley breeds his Buff Leghorns not only for high exhibition quality, but for egg production as well.

Black Spanish Club.

It will be to the interest of all the breeders to know that the old club of 1890 reorganized December, 1914, with twenty-five old members and many new ones. Many cups and ribbons will be given to bring this old breed back again to public favor. All good work is due to Mr. Helpman, the oldest breeder of this breed in the United States. Join the club. Get quality and layers of the largest white eggs. Boom your favorites. The annual dues are $1.00, and all communications should be addressed to J. L. Helpman, secretary-treasurer, Freedom Station, Ohio.

The National American Dominique Club announces through their Secretary, A. Q. Carter, the following officers. This is a live Association and is doing much to bring back the old Dominique.

President—Prof. C. Weygandt, Philadelphia, Pa.; Vice President—F. E. Fowler, Meriden, Conn.; Secretary-Treasurer—A. Q. Carter, Freeport, Maine. Executive Committee—C. W. Besse, Jefferson, Maine; George H. Dederer, Mt. Vernon, N. Y. State Vice Presidents—Maine—Chas. E. Taylor, Freeport, Me.; New Hampshire—F. S. Peaslee, Lakeport, N. H.; Vermont—E. W. Page, Plain-

field, Vt.; Massachusetts—Frank M. Hoard, Taunton, Mass.; Connecticut—F. M. Buckland, Glastonbury, Conn.; New York—Abel Weeks, Tarrytown, N. Y.; New Jersey—Chas. W. Jones, Holmdel, N. J.; Pennsylvania—J. B. Keirn, Madison, Pa.; Ohio—Dr. H. H. Lehman, Ashland, Ohio; Wisconsin—John Blanchard, Columbus, Wis.; Michigan—F. O. Homel, Fennville, Mich.; Iowa—J. Stevens, Webster City, Iowa; Missouri—Clark Robinson, Columbia, Missouri; Montana—R. L. McKellar, Harlowtown, Montana; Oregon—Miss Alta Plank, Woodburn, Oregon; California—Elias Gallup, Hanford, California. Lecturer on Dominiques—Dr. W. H. Davenport, Griswoldsville, Mass.

AMERICAN CORNISH CLUB.

Illustrated with fifty-two cuts of Cornish birds, officers of the club, etc., the American Cornish Club 1915 Annual is ready for mailing.

This work on the Cornish bird, free to all members of the American Cornish Club, and only 50c to interested fanciers and breeders, is full of valuable information about the grand old breed, and should be in the hands of everyone interested in Cornish advancement.

Whereas the 1914 Annual showed only one hundred and seventy-four members in good standing, the 1915 edition shows nearly three hundred hustlers for the Cornish bird, paid up until February 1st, 1916, the end of the present club year, and what is best of all shows a balance on the right side of the ledger of $78.00 in the report of the secretary-treasurer.

Those interested in the Cornish or caring to have a copy of the 1915 American Cornish Club Annual will receive prompt attention if they will address John W. Ward, Jr., National Sec'y-Treas., American Cornish Club, Pennington, N. J.

The American Black Orpington Club.

The 1914 election of officers of the American Black Orpington Club resulted in the following officers being elected: President, C. S. Byers, Hazelrigg, Ind.; vice president, R. N. Barnum, Lime Rock, Conn.; secretary-treasurer, Ralph Whitney, Rochester, Minn.; Executive committee: Ora Overholser, Eaton, Ohio; R. Roberts, Essex, Ont., Can.; C. J. Carter, Columbus, Ind.

The American Black Orpington Club was merged with the National S. C. Black Orpington Club at the annual meeting of the National at Pittsburgh, Pa., Exposition Show, January, 1914, under the name of the American. All of the live members of the old club transferred their membership, and now a grand united club is boosting the Black Orpingtons.

We are expecting to send a free copy of the 1915 Year Book of the club to every breeder of Black Orpingtons who will send their name and address. The book is now off the press. If you desire a copy send now. Address Ora Overholser, secretary-treasurer American Black Orpington Club, Eaton, Ohio.

The breeders and fanciers of the Columbian Wyandotte fowl are now to be represented by a quarterly magazine, published four times per year, March, June, September and December. The initial copy has just reached us. D. L. Orr, Orrs Mills, N. Y., is the capable editor and Ralph Woodworth, Grafton, Mass., business manager, and we presume sample copy of March issue will be gladly mailed to all Columbian Wyandotte fanciers who ask for it.

The National Rose Comb White Leghorn Club has issued its Year Book for 1915. This is a small club, devoted to a variety of sterling merit that should have more attention than it now receives. For information address the secretary, J. M. Chase, East Pembroke, N. Y.

National Partridge Wyandotte Club Election.

At the annual election of above Club the following officers were elected, Prest., E. O. Theim, Denison, Iowa. 1st Vice-Prest., E. J. Curtis, Milton, Wis. 2nd Vice-Prest., C. H. Wood, Shrewsbury, Mass. 3rd Vice-Prest., Lester Newall, Monett, Mo. Secy.-Treas., J. F. Tallinger, Bernard, N. Y.

LAKENVELDERS

"The Most Beautiful Fowl Known. Winners of Silver Cup at PHILADLEPHIA 1914 SHOW.

Woolifield Poultry Yards
Folsom, N. J.

1st Pullet at Chicago

Dec., 1914 in S. C. Buff Leghorns was hatched by me on June 20th. I hatch my winter layers in May and June. "Egg-Basket" Strain matures quickly. Early hatched Leghorns moult in winter months when mine are laying. Take this tip from a breeder who has won this season, 1st hen, 1st and 3rd pullet at Chicago and made records in Official Egg Contests of 211 in 9½ mo. 215 in 11 mo., 230 in 11½ mo., etc.

Eggs and Chix right now.

L. E. HEASLEY,
Box F. Holland, Mich.

First prize Barred Rock Cockerel and Champion male at the club show, Pittsburgh, Pa., January, 1915. He also won both color and shape special. A beauty in quality, very clean and evenly barred and excellent under-color. He was one of the best winners we handled last season. His owner and breeder, Mr. L. B. Ressequie, Millers, N. Y., was one of the leading winners at this show. H. P. S.

The American Buttercup Club have, through their Secretary, Mr. G. A. Williams, mailed one of the neatest and most interesting catalogues ever sent out by any Specialty Club. Brim full of interesting reading, with the winners of the Club Specials, etc. Great credit should be given Mr. Williams as this book shows careful and tremendous work on his part. The Buttercup is gaining in popularity and well it should be. We prophesy that with the club showing the present activity this popularity will grow with leaps and bounds.

Just as we are going to press, we have a letter from President Frederick G. Davis, of the Poultry Exhibition of Pittsburgh, announcing that at the annual meeting of the organization, Mr. E. F. Baldwin had been elected Secretary for the ensuing year.

Mr. George M. Wilkinson, Secretary of the Blairsville, Pennsylvania Association, writes us that Mr. C. S. Smith and Mr. J. E. Weaver have been selected as judges, also that the dates are set for the next event. The dates are December 13 to 18 inclusive.

The Oil City Pennsylvania Poultry Association have set the week of January 12th as the dates for their Second Annual exhibition. The show last year was a decided success in every way, which has stimulated the members to still greater energy in building for this Winter's event. Their slogan is "One Thousand birds for 1916". Any information as to this exhibition will be cheerfully given by the Secretary, Mr. Chas. R. Baker, Oil City, Pa.

Mr. W. C. Brunig, Secretary of Elkhart Poultry Association, Elkhart, Ind., writes us that the dates for their next show are January 24th to 30th, inclusive. Mr. Henry C. Dippel, of Indianapolis, Ind. has been selected as judge and every effort is being made to make this an exhibition of quality.

The New Jersey Fanciers Association will hold an important meeting in the near future to arrange for their 2nd annual show. Here is a live bunch of poultrymen, who are making new history in poultry affairs in this great fanciers center.

Last November the show held at Somerville, while small, was of fine quality and the intention this year is to make it wider in scope and of greater importance. New Jersey is always in the front in active work and we predict a grand future for this show and association.

LIST OF JUDGES FOR THE COLISEUM (CHICAGO) SHOW NEXT DEC. AND VARIETIES THEY WILL HANDLn.

O. L. McCord, Peoria, Ill.: Black and White Langshans, Buff Rocks, Buff Leghorns and Black Minorcas.

TAYLOR BROS., 24 Market Street. Camden, N. J.

The style of Wyandottes, bred by Mr. John S. Martin, Port Dover, Ont., is well shown in the chicks above. His Regal line show the ideal Wyandotte fullness at all ages. H. P. S.

EVERYBODYS CHATS—Continued

If any of our readers have any of the old poultry books, with no special use for them, we would like to hear from them with particulars. We also wish to get copies of bound volumes of some of the old poultry papers for reference, etc.

A husband is what is left of a sweetheart after the nerve has been extracted.

We have received many letters from readers of the American Poultry Journal saying they will miss my "CHICK-CHATS". They should subscribe now for "Everybodys" and we will try and interest them with our "Everybodys-Chats" just as well as before. Better still—Send us $1 and we will send you both the American and Everybodys for one year. This is our special club offer and you will want both papers.

Lying is a fault in a boy, an art in a lover, an accomplishment in a bachelor and a habit in a husband.

It is our constant thought and wish to make "Everybodys" a desirable and popular Poultry Magazine. If it meets with your approval, then tell everybody, if not, tell us. We look to our friends, and to all that stand for fair-play to recommend Everybodys.

Another iconoclast has got in his work. He has produced a seedless apple, the fruit generating from what looks like tow folded leaves, the tree bearing no blossoms. The idea of a spring without apple blossoms!

CORRECTION.

In the list of awards at the Madison Square Garden Show published in our April issue, the Red Poultry Farm, of Bethlehem, Pa., was credited with 2nd prize S. C. Rhode Island Red cockerel. This was wrong, as the S. C. Rhode Island cockerel which won 2nd prize is owned by Mr. F. C. Woodward, of East Longmeadow, Mass.

Shorewood Peerless Vegetable and Flower Garden

Ten Choice Vegetables

Beet, Carrot, Cabbage, Cucumber, Lettuce, Onion, Radish, Parsnip, Tomato, Turnip.

Six Standard Flower Seeds

Aster, Balsam, Cosmos, Nasturtium, Phlox, Sweet Pea.

16 Large Packets 26c

In this collection we use the John Baer Tomato. It sold last season for $1.00 per Pkt. This collection is worth $2.00—you buy it for 26c and you get full cultural directions for vegetable and flower growing, worth in itself more than we ask for the seeds. **Very special.** A copy of "Good Poultry" (10c), our quarterly magazine; also a copy of "Intensive Farming," a valuable book for poultrymen, vegetable and flower growers, fruit growers, etc., all included in this wonderful offer.

If you want an extra Pkt. of John Baer Tomato, add 25c to this collection price. If you want an extra Pkt. of any other vegetable or flower seed named in this grand offer, add 5c per Pkt.—one-half regular price. This is the greatest offer we have ever made to the farmer's wife or the back yard gardener. Everything just as good as can be. If not entirely satisfactory, money refunded upon return of collection at our expense, without argument. This offer is made to introduce Shorewood seeds to you. Good as long as stock holds out. Write tonight.

Save 2/3 Fuel Cost With A Kerosene Burning Sandow

Investigate!

Without change of equipment, the Sandow runs on kerosene—gasoline—distillate—or alcohol.

On low priced kerosene, the Sandow delivers more power per h. p. of rating, than ordinary engines do on gasoline. With the Sandow you can save the price of your enigne in upkeep economy alone. Investigate! Get all the facts.

Write for Free Sandow Book, which shows you by illustrations from photographs why the Sandow is the simplest engine made—the easiest to run—the most free from trouble and repair expense.

Only 3 Moving Parts

Starts at 40 degrees below zero. Starts without cranking—runs in either direction—throttle governed—hopper and tank cooled—speed controlled while running—no cams—no valves—no gears—no sprockets—light weight—can easily be taken anywhere for work—complete ready to run.

THERE'S A SANDOW FOR EVERY FARM

Made in all sizes from 1½ H. P. to 18 H. P. Have a Sandow to meet your needs—do the work you want done at greatest economy. Sandow will do your pumping—run your feed grinders—your cream separators—do all the stationary power work of farm or shop, and save you more money than any other engine on the market. Sandow is not just an ordinary engine. Special design for kerosene fuel means more simplicity, greater durability. Send for Free Book and judge for yourself.

TEN YEAR IRON CLAD GUARANTY

Absolutely protects you—Sandow must make good on every claim. It is because Sandow is making good every day on thousands of farms that we can make this iron-clad, binding guaranty. Users everywhere will tell you how Sandow saves fuel—saves trouble—saves repairs—and can be depended on for power all the time.

FREE TRIAL ON YOUR FARM

Book gives our Free trial proposition. Use the Sandow every day 30 days on your own farm. If you don't say it is the most economical and most powerful farm engine you ever saw—if it does not satisfy you every way, send it back and we will refund every cent you paid for it.

SPECIAL LOW PRICE DIRECT TO YOU

Just compare these rock-bottom prives for Sandow Engine, with those of any other engine manufacturer, and remember Sandow quality is unsurpassed. Sandow prices are: 1½ H. P. Bull Pup Engine, $33.75; 2½ H. P. Sandow, $42.50; 4 H. P. Sandow, $65.00; 6 H. P. Sandow, $95.00; 8 H. P. Sandow, $140.00; 12 H. P. Sandow, $250.00; 18 H. P. Sandow, $385. We have no agents—no jobbers—no middlemen—no dealers. You buy of us and keep all the middle profits and commissions in your pocket. Before you get any engine, be sure to have our low figures and see what you can save.

SEND FOR FREE SANDOW BOOK

It is full of plain facts on the farm engine question—illustrated from cover to cover with pictures from photographs showing the simple construction of every part of the Sandow—contains the letters of users of the Sandow. Remember it costs you nothing to get the facts—does not place you under any obligation whatever. Write today. A postal brings the book. Address

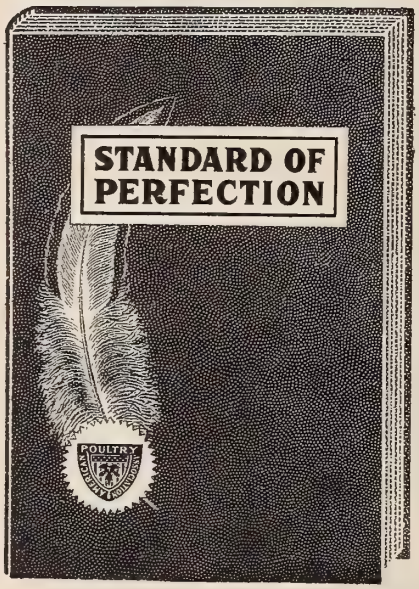
American Standard Of Perfection

1915 Revised Edition



1915 Revised Edition

The only American authority on the required characteristics of all breeds and varieties of Chickens, Ducks, Geese and Turkeys. THIS GREAT BOOK has just been revised and gives the correct Standard Shape, Color and Weight of every recognized variety of poultry, as well as the disqualifications of each variety.

THE BOOK YOU NEED

You cannot raise, mate, exhibit or sell fowls intelligently without it. The book contains all the NEW BREEDS admitted to the Standard. It also contains ideal illustrations of the different varieties of fowls photographed from living models and gives the correct color of plumage on your birds. It's a guide to success in the poultry business. No one can breed birds of any variety for exhibition without a copy of the **American Standard of Perfection** as a guide, and it is the only book of its kind published in this country. It is authorized, copyrighted and published by the American Poultry Association. Price postpaid, cloth, **$2.00**; leather, **$2.50.**

Everybodys Special Money Saving Offer

The Am. Standard of Perfection (cloth) and Everybodys Poultry Magazine for One Year **$2.25**

If you want leather binding add 50 cents to above price. Canadian Subscribers add 25 cents per year for Postage. Foreign Subscribers 50c per year for Postage.

We are now booking orders for delivery for June 10, 1915. If you want your copy early order at once. Address

EVERYBODYS POULTRY MAGAZINE PUB. CO. - - - HANOVER, PA.

THE BOOK OF THE CAMPINES

BY THEO HEWES

IN preparing this, the latest and most authoritative edition yet issued on the subject of Campines, no effort has been spared to make it the best and most valuable work on the subject.

The Historical Notes, by Dr. H. P. Clarke, cover the ground completely and no man in either Europe or America is better qualified to prepare a chapter of this kind than is this man who predicted the present popularity of the Campine and kept advised of its developments both in Europe and America years before any of its present day advocates.

An Illustrated Campine Standard

Theo. Hewes in the mid-section of this book, with his lengthy and complete illustrated article presents the Campine breeders the first definite and specific exposition of Campine type and color that has been put forth. Accurate, definite description of every section, each illustrated with specially prepared drawings showing both perfect and defective shape and coloring, contrive to give the reader the most definite insight of Campine characteristics that has yet been offered.

Full-page "Hewes" charts of the kind made popular by Mr. Hewes in previous breed books are used to show correct shape and color and constitute the most satisfactory means yet attempted to attain this end.

ORIGINAL DRAWINGS

Four full-page and thirty smaller original drawings by I. W. Burgess working under Mr. Hewes' direct supervision are used to illustrate Mr. Hewes' article.

Chapters on care, management, breeding, conditioning and exhibiting by leading Campine breeders are included in this book and aid in making it the superior work that it is. **Price 50c Postpaid.**

FIRST PRIZE PEN SILVER CAMPINES BOSTON SHOW JAN. 1915. BRED AND OWNED BY HOMESTEAD CAMPINE FARM WAYLAND MASS.

Homestead Campine Farm, Wayland, Mass., won best display including four out of five first prizes competed for in the Silver Campine classes at the recent Boston Show. The above pen represents their first prize pen at this Show. They were very evenly matched pen of females in size, type and color while the male was a good sized, vigorous looking individual, a beautiful rich, lustrous body color. His hackle, considering his strength of wing and breast color was fairly clean of black markings. It is our opinion this pen mated just as they are should produce some excellent results as breeders as the females showed plenty of tail markings, good wings, and rather clean hackles and all of them had nice, neat well-shaped combs. Mr. Phipps, proprietor, informs us that he is paying much attention to vigor and vitality which is bound to keep the good name of the Silver Campines as one of the best egg producers which the fancy possesses. (A. O. Schilling.)

EVERYBODYS POULTRY MAGAZINE

Vol. XX. HANOVER, PA., JUNE 1915 No. 6

POULTRY EXHIBITIONS

Their Advantages Not Only for the Exhibitors but for the Public.

By Charles D. Cleveland.

If it were not for the Standard of Perfection there would be no fancy poultry; if there were no fancy poultry there would be no poultry show and if there were no poultry shows there would be little advancement made in the breeding of poultry, not only from the fancy, but also from the utility standpoint.

This perhaps seems a pretty broad proposition, especially as I have introduced the word "utility," which is now attracting more than usual attention from the pens of poultry writers. I must, therefore, very briefly give my reasons for the propositions laid down.

It is not necessary to discuss the first portion of my statement, viz: that if there were no Standard of Perfection there would be no standard or fancy poultry; that is a self-evident fact recognized by all. Nor is it necessary for me to comment at length upon the second part of my statement, to the effect that if there were no standard poultry there would be no poultry shows. But it is to the last part of the proposition that I must direct the readers' though viz: that without poultry shows the advancement, not only along fancy but along utility lines would be practically nothing.

This latter proposition, as the preacher said, naturally divides itself into two parts; first with reference to fancy poultry and all that goes with it, and second in regard to utility poultry and all that goes with it. In the first place poultry associations were organized by breeders of fancy fowl to enable them both to exhibit the products of their skill and also to compete with others to demonstrate which had the best specimens of each of the various Standard bred fowls. The spirit of rivalry and the desire for competition (coupled with the special desire for winnings) is in the breast of all men. The excitement and exhilaration, as well as the satisfaction of winning, is the light that draws all the fanciers to the show and, to those who make it a business and their livelihood to breed poultry, winning means more than the mere pleasure of excitment "incident to the game." It means large sales of both stock and eggs at better prices. This desire to win and to exhibit naturally stimulate breeders to greater efforts. If one is beaten this year his desire immediately arises to beat the other fellow next time and so it goes from one year to another with the old breeders showing year after year and meeting the competition of all the new men in the game. Thus really marvelous progress has been made in the development and perfection of the various breeds of poultry and pigeons and it is scarcely to be doubted but that Noah would be greatly surprised to see into how many varieties his original pair of doves had been divided. Now, this competition not only improves the existing varieties and makes new ones, but it also brings men into close and friendly relations in the show room and makes a wider acquaintance between the breeders in a way which nothing else can do. Comparatively few men are poor losers; comparatively few take defeat in anything but a sportsmanlike manner; comparative few say that the judge is "all wrong" and comparatively few leave the hall with anything but a wholesome respect and regard for those who have beaten their entries. Thus friendships are made which last for a life time. New ideas are acquired of great benefit and assistance to the exhibitors; methods of breeding are learned which it might otherwise take years to discover, and the weak points of each exhibitor's strain are brought forward so that he can really see them.

In addition to the competitive side of each poultry exhibition where skill in breeding, raising, fitting and exhibiting are made the tests of the ability to win, the executive and business ability of men is also put to the test. The officers and clerical force of the exhibition must show their ability to properly catalogue and arrange the exhibits and conduct the exhibition in an up-to-date and efficient manner so that it will be pleasing not only to the exhibitors but to the public. A poultry show is very much like a dozen horse shows rolled into one, for not only must each specimen be properly entered on the books and be given its correct number and place in the hall, but it must always be placed in its proper coop or pen, and one error may put all the rest of the show into confusion. Each entry must be properly received and checked off, must be well taken care of, amply fed and watered during the time of the show and must, at the conclusion, be carefullly put back into its own shipping box and expeditiously returned to its owner. The comfort and convenience of the exhibitors and their friends and acquaintances must always be consulted by those in charge of a poultry exhibition. The hall must be tastefully arranged and if possible properly decorated; the arrangement of the coops must be attractive and convenient; proper precautions must be taken against fire, theft or injury to the exhibits; due arrangements must be made to keep everything in a cleanly and sanitary condition and all financial matters connected with the show must be dealt with in a thoroughly businesslike, prompt and

efficient manner.

All this brings out the business efficiency of the staff which is running the show and developes in these men modern business sense, courtesy, forbearance and energy; and it is a task of no mean proportions to properly run off, to the satisfaction of a majority, a modern poultry exhibition—which now has many sides and departments not formerly connected with the early and small exhibitions of the feathered tribe.

And it is with reference to a number of these new departures and departments that the utility side of the poultry business is and can be greatly stimulated and benefited.

While it is undoubtedly true that every breeder of fancy poultry does and must keep the utility value of his birds in plain sight and must appeal to the public from both the fancy and the utility end, it is, of course, quite natural and proper that in the competitive classes among the Standard bred fowls the fancy points and characteristics of the birds be given the greater prominence that is what the poultry show originally was for. It was to ascertain who had the best show birds in each breed—those which most nearly fitted the descriptions given in the Standard of Perfection, and therefore the birds in competition are judged solely by the Standard and very largely win or lose in accordance with their "standard" or purely fancy characteristics.

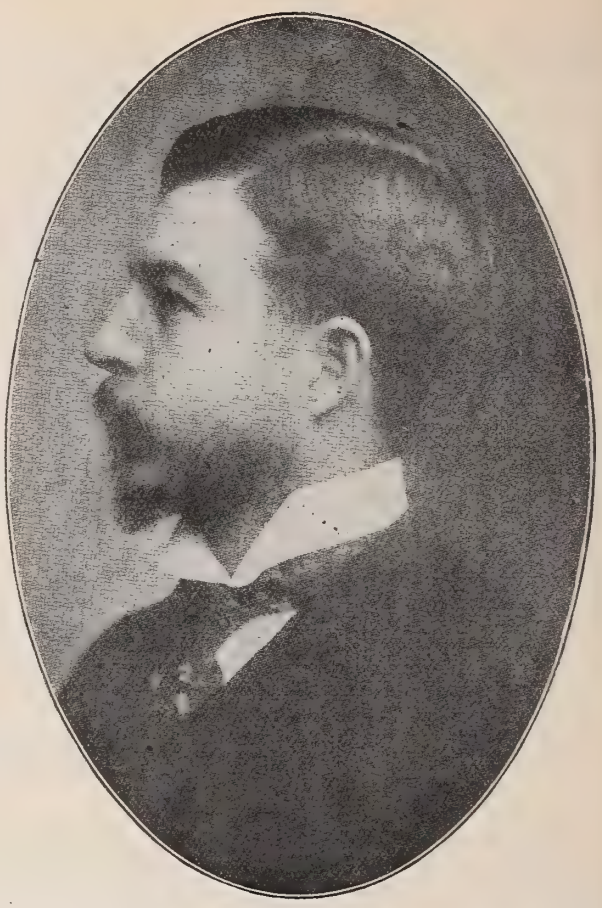
But now-a-days a great many people come to a poultry show who have not either the time or means to devote to strictly "fancy" or "show" stock. They wish an inferior grade of birds from the stand point of Standard requirements and are looking chiefly for vigorous specimens which are "true to name" but have not all the little refinements or "extra polish" of the top notch show entry. This class of visitors is after the so-called utility stock and their desire is to obtain something which is good for eggs and meat and is better than the ordinary mongrel or barn yard fowl. Most of these people have not the desire or ability to become fanciers in the true sense of the word, but they are interested in chickens; they want to better with them than in the past and come to the show for information and enlightenment.

Now, these people must be taken care of and induced, if possible, to buy. Many of them after a while become fanciers and take up the show end of the game, but many of them do not, and in any event, they must be started on the right track with at least pure bred stock.

So in a modern show it has become customary and proper not only to open the doors to exhibits of so-called purely utility fowl, but also to furnish information along proper lines to the men and women who are seeking for it. Large displays of birds are now made which are advertised to be either very superior market fowls, or to be bred from heavy laying trap-nested stock; birds which will look well on the farm and which, without too much care or attention, will produce and reproduce satisfactorily. Lectures are now popular with the public along simple and practical lines; modern and up-to-date poultry appliances are exhibited in every show and displays of foods demonstrations in the grading and packing of eggs; caponizing; killing and picking, and the hundred and one incidentals connected with the poultry business are now, or should be, installed in every poultry exhibition. In some localities displays of dressed poultry and eggs are found interesting and profitable to visitors and wherever such displays can be made in suitable manner they should, of course, form a part of the regular attractions.

The lecture side of the modern poultry show has not begun to be developed and to the writer's mind is of very great importance. Many hundreds of people are now earnestly seeking correct information along poultry lines and if short talks of a simple and elementary nature are given wherever possible he believes that the management will find that the lecture hall will be crowded to the doors.

And this information must be absolutely accurate and to the point. Long discussions of problems which are now attracting the attention of the scientists in poultry have little or no place in the poultry show, for that is not what the general public is interested in; plain talks on practical matters which are essential for the beginner are eagerly sought for and stereoptican pictures or motion films are a great assistance along these lines.



MR. CHARLES D. CLEVELAND, Secretary of the M. S. Garden, New York Show and Associate Editor of "Everybodys."

Thus it appears that a poultry exhibition has many sides and is attractive to a very large number of persons of different tastes and desires, and it is quite evident that these exhibitions are becoming daily more and more popular and that the interest in poultry and poultry culture is steadily gaining a greater hold with the American public. It is manifest that great improvements can be made at all poultry shows; that these shows must keep pace with the art and development of poultry raising and that better methods in all departments are being, and will be, discovered and perfected; and it must be the ambition of every poultry show secretary to strive to make his annual exhibit as complete and satisfying to the greatest number of persons of all classes as possible.

It is, therefore, clear that the poultry show is a great benefit, not only to the fanciers, who exhibit their Standard bred fowls in competition, and to the so-called purely utility man, who makes his displays to attract a certain portion of the public, but also that these exhibitions are valuable because they bring men into closer association and acquaintance and that they develop sportsmanship, intelligence, a proper feeling of rivalry and ambition and the business ability of those in charge, and that they are also doing a large and efficient educational work.

THE PRIME CAPON

A More Extended Practise of the Operations of Caponizing Will Mean a Greater Revenue From Surplus Cockerels as Well as a Better Quality of Poultry Flesh.

By Prof. H. R. Lewis.

Each year sees a greater increase in the practice of caponizing. As an industry it is but in its infancy. Owing to the increasingly high prices which must be paid for beef and other form of meat, and owing to the increasing demand of meat of high quality, there are greater and greater possibilities in capon growing. These possibilities

are apparent when their production is carried on as a commercial industry and also when produced by the small back yard poultry keeper to get poultry meat for the home table. Success in this work means a thorough acquaintance with the operation and a considerable amount of practice.

A capon is a male bird from which the reproductive organs have been removed at an early age; the removal changes the bird in many ways, altering the shape, the nature and the color of the plumage. It causes the loss of many masculine characters and induces a rapid flesh development.

The capon possesses many material advantages over the roaster, among the important ones being larger size and greater weight at the same age. The meat is also much sweeter, finer flavored and more tender, due to the large amount of fat cells distributed throughout the body flesh. Commercially the capon has a much higher selling value, ranging from four to eight cents a pound above roasters. The cost of feeding is less than with roasters, their being greater efficiency from the food consumed and more of the food materials going into the putting on of flesh and less into heat and energy. The capon is much more docile, and owing to its large size and inactivity bears confinement well. It is possible to rear to maturity a large number of capons on a very small area, but ideal conditions and the best growth is attained when they have freedom of range. It is claimed by some of the commercial capon growers that these birds are less subject to disease than is the roaster, and this seems to be borne out by actual practice. The greatly increased weight and value resulting from the simple operation of caponizing, combined with the superior quality of the flesh produced, is reason enough why the suburban poultryman producing products for his own table should look seriously into the possibilities of caponizing. As a commercial enterprise, the time is at hand when all poultrymen, in order to dispose of their surplus cockerels at a profit, must sell them as capons. The following table shows a comparison between an average capon and an average cockerel at roaster age.

Cockerel: Age, 10 months; weight, 6 pounds, condition, staggy and tough; selling per pound, 24 cents; total food cost, 70 cents; total selling price, $1.44; profit above food 74 cents.

Capon: Age, 10 months; weight, 9 pounds; condition, tender and sweet; selling per pound, 30 cents; total food cost, 80 cents; total selling price, $2.70; profit above food, $1.90. Difference in favor of the capon one dollar and sixteen cents.

The demand for capon flesh is continuous, the price paid is usually higher than that paid for any other kind of meat and the supply in the last few years has never fully equaled the demand. In general, the best birds for capons are hatched early in the season, the operation being performed during July. The birds are then in prime condition and quality for dressing during the holiday season, at which time they are always in greatest demand for market poultry.

It will be found a profitable practice to use almost any breed for capons, but those which permit of large gains are the most desirable. For the extremely large capons the Light Brahmas probably excel. For the medium sized bird the ordinary Plymouth Rock cannot be surpassed. It is probable that the small or light weight capon, such as will be secured by the use of the Plymouth Rock, will be in greatest demand, because they furnish more nearly the amount of meat required for the average family, while the larger bird, weighing from 12 to 14 pounds, will serve in the place of turkey on holiday occasions.

Cockerels can be caponized at any age, the best time being when they are about three months old, and weighing from one and one half to two and one half pounds. This will usually be during the months of late June or July. It is possible to use the surplus cockerels which occur in the production of pullets for this purpose as they naturally fall in this season.

The birds should be prepared for the operation by confining about thirty-six hours and with-holding all food and water. This results in emptying the intestines and making more room for the operator to work while performing the operation. It is a good plan to shut them up at night and perform the operation the second morning after. A clear sunny day is the best as plenty of light can be directed into the incision to enable better and faster work. If the weather is cloudy and wet, the work had better be postponed until fair weather, unless a bright electric light is available for the work.

There are a number of different kinds of caponizing instruments on the market. In general, it is better to purchase one of the more expensive sets, (five dollars) as they are better made and of a better design. The directions coming with the set should be studied carefully and the use and purpose of each instrument learned before attempting the work.

Space will not permit of a description of the details of the operation. If possible, the advice and instruction of an experienced person should be obtained on a few birds. This will give the amateur a good idea of the detail and then the more birds he can work on himself the quicker he will become proficient. In a word, the operation consists in fastening the bird to be caponized on a barrel or table by means of the feet and wings, in such a way that the right side is up and fastened so securely

A COCKEREL AND CAPON DRESSED FOR MARKET.
The Neck, Tail and Thigh Feathers are Left on to Distinguish the Capon From the Cockerel.

that any movement of the bird will be prevented. The feathers are plucked from the vicinity of the last rib and an incision is made about one inch long between the last two ribs through which the organs are removed by a specially constructed instrument. The lower testicle is removed first and this is followed by the removal of the upper one, thus preventing any bleeding from obstructing the removal of the lower one. After the operation the bird should be released and the wound washed with a one per cent carbolic solution to prevent infection. The birds should be placed in a clean coop with no roosts and fed soft mashes for the first two days. Any undue or violent exercise should be avoided until the wound becomes well knit together. If the work has been done properly all signs of the wounds will disappear in from two to three weeks. About three days after the operation the birds should be looked over for wind puffs which are caused by gases gathering under the skin and which should be removed by puncturing the skin with a needle or point of a knife.

The cost of feeding a capon to maturity, or for twelve

months is from seventy cents to one dollar, depending upon the cost of feed and amount of range; add to this the cost of the operation (5 cents) and the cost of the chick at hatching time and we have a total of from ninety cents to one dollar and fifteen cents. Assuming an average weight of eight pounds for a twelve months old bird, with a selling price of thirty-two cents a pound, we have a market value at killing time of two dollars and forty cents, which leaves a profit, considering the highest possible cost of production, of over one dollar and twenty cents.

The possibilities outlined above show conclusively the value resulting from a more extended practice of caponizing. To the commercial poultryman it means greater profits and to the surburban poultryman it insures an abundant supply of high quality meat for the home table.

SUBURBAN LIFE AND A FEW HENS

A Suburban Home With a Garden and Chickens, the Ideal Life With Pleasure and Profit.

By Mr. A. P. Marshall.

In these days of forced economy, one naturally turns to ways and means of preventing the waste of unused products and the utilizing of all that may be turned to good account. Many a business man has to consider seriously the husbanding of every little detail of value in order to help every department of his activities produce for him the largest amount of material good possible.

When he turns at night from his place of business it is his wish to be able to use the intervening hours between then and the return to business in the morning, in such a way as to better fit him for the day's work and if it may be in such a way as to bring him valuable return, so much the better. Many a weary worker often wishes there were something more than the daily newspaper or some such way of using his evening that would enable him to get outdoor recreation in a practical way that would carry him away from the day's worries and allow him to retire at the appointed time tired in body, but refreshed, so that he may sleep in the soundest manner and rise the following morning ready for anything that may arise at his business.

Surely of all the forms of amusement that one might think of, nothing can have a higher practical value than to be able to go out from the busy city to a suburban home where the bustle and noise may be entirely forgotten, and how much more that may be made a live interest, if a home garden perhaps and a few chickens are kept, if not for any other reason at least for the sake of always being able to have the pleasure of causing to grow and increase the various things that one may readily produce in this way. Have you ever observed the satisfaction of the business man who has raised his own fresh garden truck or a flock of well grown chickens? Most certainly that is a state of mind that must relieve him from all kinds of business worries and difficulties and when he returns to them, have his mind fresh and ready to encounter greater trials than where the irritations continue without the peaceful change to his rural surroundings.

One who has not at some time or other been able to point with pride at some product of his effort either in the form of vegetable growth or chickens of which he feels proud, has missed a satisfaction in life that should be known to all. From an economic point of view the value to be gained from these activities cannot be measured by the amount of actual profit one can secure only, but the satisfaction and the buoyant pleasure in the complete change of occupation means an immense personal profit that no one can gauge in terms of monetry comparison.

And how may one derive the largest amount of benefit in a suburban location with but a comparatively small space in which to work? No way that we know of could suit the purpose better than the growing of a small vegetable garden and the keeping of a few hens with of course, the few flowers and beds that go to beautify the surroundings. If carried out well these may all be made to assist each other and obtain the largest amount of material value as well as the increased pleasure of better and greater production. A certain amount of garden product will be such as to be available for the fowls and therefore waste is avoided. Fertilizer of the best kind will be secured from the hen house, with which to enrich the truck and flower beds, and the table scraps may be used for the chickens, which if they are few in number may form during the summer season the greatest portion of their feed and in this way prevent absolutely any waste.

At a time when costs have to be so closely considered what an advantage it is to be able to have nice, tender, fresh chickens; eggs that are better than can possibly be bought anywhere and crisp fresh vegetables instead of the half-dried and shrivelled articles one is obliged to accept sometimes or go without. Surely this is a big enough return for a little interesting effort each day and when it may be secured at a lesser cost than can inferior articles be obtained, it surely has a value hard to improve on in the day's routine.

Naturally it would be out of the question to expect to grow the garden and the chicken on the same ground. Large fowls at least must be kept yarded while vegetation is in the growing period and one must also bear in mind that while a few lettuce heads or something else eaten up or destroyed may not seem so serious, if the damage is done by your own birds, it is a different matter if they prove to be the property of a neighbor. It is a very simple matter to keep the old fowls yarded and they should be kept in restraint by as high a fence as necessary

PARTRIDGE WYANDOTTES.

Bred By The Sheffield Farms, Glendale, Ohio.

The Sheffield Strain of Partridge Wyandottes has long been a factor in breeding and show records. This line has competed East and West, North and South at our leading shows for years making a record that is unapproached by that of any other line or variety that we know of, these records include the M. S. Garden and Palace New York Shows, Boston, Chicago, Allentown, Hagerstown and others of like prominence. Above is shown an "unretouched" Half Tone of one of their birds, note the style and shape, "A True Wyandotte" in every line. Their handsome catalogue for the asking.

J. T. H.

to keep them in. They very soon get used to being confined however and lose the desire to get out of bounds. By supplying waste greens, lawn clippings, and table scraps, they are supplied with those elements they would naturally get if running at large and frequently be found to give even better results.

No one therefore can go far wrong during these times of close application and need for retrenchment if they utilize their leisure hours in the healthful and rest giving occupation of keeping a little truck garden to use the valuable fertilizer at his disposal, and get better, crisp, fresh vegetables, fresh eggs such as he cannot buy, a dainty, fresh broiler or roaster, when occasion calls for one, and ease and rest from the strain and worries of the day's work and business.

EFFICIENCY IN POULTRY KEEPING

Eliminate Waste, Arrange Buildings and Stock for Convenience and Practice Feeding for Results.

By James T. Huston.

This is a day of efficiency, and in all lines of endeavor, whether it be the laborer at his or her daily tasks, or the banker in the daily handling of the country's dollars, all must prove their worth or be lost in the daily grind of twentieth century progress.

In no other branch of business can efficiency count for more, or bring greater results than the handling of poultry, whether your flock consists of a few "fancy" ones on a back lot, or a ten thousand hen flock on a modern poultry farm, efficiency must be practiced and put into play if you desire to reap the profits which are due you.

True it is that many failures have been made in the poultry business, and failures will be made as long as this old world stands, but why the failures should be so magnified, and so little said of the successful men and women in the "chicken" business has always been a mystery to the writer.

We believe that any man or woman, who has a fair knowledge of the care and attention required in raising poultry, can succeed in the business, this, of course depending on the ability of the person in being able to handle the proposition without the increased cost of hired labor.

The most successful poultry plants in existence are for the most part, "one man" plants, and right here, let it be said, is where efficiency counts.

Build on a foundation of careful arrangements, feel every inch of the way, and where others have failed, make these failures your most careful study. We believe that many of the failures in the business come from the fact that the beginner in starting his plant has as his goal the success attained by a large and successful breeder. While it is right and proper that this goal should be strived for, it is also well to remember that this large and successful breeder, at one time started as you have started, and only through his being able to grasp the details, day by day, and building his business on a system such as all successful ventures are founded on, that he has attained the goal to which you aspire.

Books are written by the score on poultry topics; some are of little value to the beginner, others are the cause of many failures, yet if judgement is used in the selection of the books you should read before entering in a large scale into poultry keeping, much help would be rendered you. It will be the purpose of "Everybody's Poultry Magazine" to list only such books as the Editor knows to be of value and written by authors who know where-of they write.

Books are an education, and the student of our best poultry books have the advantage of a course of instruction which for a small outlay will be of inestimatable value and of great benefit in the building of a successful poultry plant.

We have visited poultry farms where all that lacked was system to make them paying, yet the owners failed in every way to comprehend the reason of their apparent failure.

Eliminate waste, arrange your buildings for convenience in handling your stock, learn the secrets of successful feeding, utilize your room to the best advantage, and "Try."

Some time ago we visited a plant where the natural conditions were ideal, yet the owner of this plant had built his houses and laid out his runs in such a manner that his work was doubled. A nice little stream crossed this farm, but this poultry man was carrying water to his breeding pens, where the houses could have been so planned that the stream could have been utilized in avoiding the labor of supplying water most of the year, his reason being that the buildings looked better and showed to greater advantage from the road. We mention this to illustrate how often little things such as this make extra labor, aside from depriving the stock of one of nature's best helps.

It is not always the fine buildings and equipment which make the most profitable plants; in fact they are useless, unless the owner knows the methods of successful poultry keeping and puts the right ideas into effect.

We have not attempted to touch on what breed you should take up, or which is the most profitable as exhibition, layers, or market fowls, this is a question which can be settled by yourself. If your conditions are right, your ideas and knowledge of mating up to the standard

One of the gems of the Campine classes at the recent Boston Show was the first prize pullet. She was a specimen full of style and action showing plenty of vigor and vitality. The fact is the egg shown lying before her in this picture was laid a few minutes before this picture was taken. Campines have always been heralded as egg producers, especially in Belgium from whence they originated and with their improved style of plumage they are a breed to fill the wants of those wishing an all around beautiful and useful fowl.

The above pullet was one of the choicest we have seen this past season having excellent shape and beautiful clear snappy barring. No doubt she will be a valuable individual as a breeder in the pens at the Homestead Campine Farm, Wayland, Mass. (A. O. Schilling.)

you have no fear of failure in this respect.

In this article we are only hoping that we may spur the beginner on to greater efficiency in the conducting of their business, realizing that economy must be practiced both in building their plant as well as the running of same. We do not wish, however, to be misunderstood in this respect, and in stating that economy should be practiced, we do not advise cheapness, as no where else is cheapness more to be avoided than in cheap houses, feeds or cheap stock. Economy seldom means cheapness. Efficiency, if

worked out will soon determine the weak spots, and it is up to the man or woman who is operating the plant, to see that every move counts, that no useless steps are taken and that time saving devices mean more saving to them.

Remember each day has its tasks and that every moment which you spend to advantage means greater profit to you.

Start slow, build on a carefully prepared plan, profiting by the mistakes of others and only following in the course of our successful breeders, where you are sure that your conditions are of such a nature that you have the same opportunity for success as they.

We believe the best asset the poultryman has is the natural love of the work. Whenever it becomes a drudge, better stop, as here is where success vanishes.

Keep careful account of every expenditure, produce with quality the first consideration, make your reputation on clean and square dealings, and we believe that no other business will prove of greater profit for the amount invested than the poultry business.

MATING AND BREEDING PARTRIDGE ROCKS

By Mating Fowls That Have Desired Characteristics a Marked Tendency Toward Improved Quality Would be Found in the Progeny. ***By S. A. Noftzger.***

Since the grand fowl is strictly the result of careful single mating and line breeding the most satisfactory results, both from a fancy and utility standpoint, are obtained from the use of specimens of each sex, that conform as nearly as possible to the standard. In other words single standard mating, with utility qualifications and line breeding, furnish the key to success with this breed which produces more true to type than most other breeds and is now attracting so much attention.

As is the case with any breed there are a few essentials in mating and breeding Partridge Rocks, which is well to bear in mind when selecting fowls for the pens. Although fowls to produce show specimens, like the mixing of the artist's paint, is difficult to explain to another.

Both sexes should be sturdy and vigorous since it is necessary that the youngsters inherit vitality and stamina. A male and female with the same striking defect, such as poor eye color, bad combs, defficient breasts, ill shaped backs, etc., should not be mated as such matings will have a tendency to stamp the imperfection indelibly on the offspring. On the other hand, by mating fowls, both sexes of which have the desired characteristic, a marked tendency toward the coveted quality would be found in the progeny.

It is a comparatively easy matter to improve or perfect fowls in any one section, but to correct faults in some places without a backward tendency at others, is another and very serious proposition. To this end we must keep always before us the fundemental rule "never mate similar defects."

Ideal Light Brahma Male as adopted by the American Light Brahma Club.

A very vital matter for successful mating is familiarity with the ancestry of the breeders. A good specimen coming accidentally from inferior stock, is very much less valuable as a breeder than one of less quality, from a line of good individuals. Consequently it is very important that we know the dam as well as the sires of our breeding stock.

It is also very neccessary from a utility viewpoint to have exact knowledge of the laying qualities of the hens and to know whether the males are from hens that were fine layers, so that pedigreeing for show specimens enables us to be perfectly familiar with the laying or utility qualities of the breeders and to choose intelligently for utility while selecting for standard requirements.

Aside from these general suggestions for mating there are a few inclinations that might be observed to advantage. While originating and perfecting the breed there were certain undersirable tendencies that needed careful consideration and to be guarded against. For instance, the cross of (then) Indian Game inclined the offspring to high station and this should not be allowed to reappear. Clay breasts in females and motted breasts in males came with the cross of Golden Wyandottes and made much trouble for several years, so that these objectionable features should not be encouraged as all breeds naturally "breed back" to their early or original stage.

It might be well to mention that the theory that the male with brown in fluff, will breed females is not correct. My experience has been to the contrary. Wherever any writer advocates other than single standard matings for this breed, it can safely be assumed he is not writing from his own experience or has not been breeding true Partridge Rocks. They were made by single mating from the start and the attention their quality attracts from judges and fanciers the world over, is positive that the plan was successful.

Like all old breeds, there are some imperfections to be met with and to be kept out of the pens as much as possible. In case a fowl must be used with one of the defects see that the opposite sex is strong in this respect, unless the ancestry of both were unusually good where these are deficient.

Ideal matings for shape, as with all other Rocks, are fowls as near standard size as possible—not under and not over weight—with good sweep of back, low tails, width of backs carried the full length of bodies, keels carried pretty low and good length of shanks.

For color select the male with rich medium color neither the light orange that is frequently met with nor so dark that it is difficult to distinguish the beautiful stripe of the back and saddle that makes the head of the pen so attractive. He should not only have a solid black breast and fluff, but above all see that he has no white in undercolor of neck. The undercolor of body should be slate of medium shade.

A good stripe, of correct shade, in both hackle and saddle free from "cotton" in undercolor in these sections makes a fine male even if but fair in other respects, while if added to these are correct size, good shape and good color in other sections, the male bird is good enough to grace any pen.

The female should be mahogany in color, of medium shade, neither too dark nor too light. The penciling should be regular in all sections of the body, from well up to the throat, on the breast, back to the tail and fluff. The color requirement for neck of female is a stripe and while very few fine specimens appear with the desired hackle color, yet there are enough to justify us in believing that aventually we will have neck color of female as good as that of the male. After all it is not that which

comes easy that is most prized, but that which requires effort is greatly appreciated.

It is well to select females as good in leg color as possible and to make sure always that the male is excellent in this respect.

With combs, this fowl has as little difficulty as other single combed varieties, but always mate with at least one sex good in this respect. The same applies to stubs on shanks and other difficulties that occassionally appear with all breeds.

Careful selection and intelligent mating of true Partridge Rocks, even with fowls of but fair quality, if bred "in the purple," will result in a crop of youngsters of surprising even quality. They hatch little "brownies," in color very much resembling the young of the most of our wild fowls, and seem to inherit the vigor and vitality that go with their little wild cousins, for this seems to be nature's color.

Ed. Note:—Mr. S. A. Noftzger. Manchester, Ind., is one of the originators of the Partridge Plymouth Rocks upon whose work and writings we can place much dependence H. P. S.

THE GREAT UNIVERSAL POULTRY SHOW

The Live Stock Department of the Panama-Pacific International Exposition at San Francisco is Making Extensive Plans for a Poultry Exhibition That Will Mean a Great Deal to the Industry. The Plans as Now Perfected. By Superintendent, Mr. T. E. Quisenberry.

There are many reasons why the Universal Poultry Show of the Panama-Pacific International Exposition should be one of the best and greatest exhibitions of pure bred poultry that has ever been held in this country. It will be so if the Live Stock Department can have the cooperation of at least a reasonable number of the best poultrymen in each State. This show should go down in history as one that reflects great credit upon the intelligence and progressiveness of American poultry breeders and one that will result in inestimable benefits to the industry in general. It should mark an era of advancement and improvement in many varieties and breeds and will be the first big show of the country to be judged by the new 1915 Standard of Perfection. It ought to open up many new fields and make an outlet and create a demand for better stock and eggs in many portions of America, especially on the Pacific coast and throughout the west.

This show is to be held in the center of the greatest natural field, for both fancy and utility, that is now open to the growth and development of the industry. They have the soil, the climate and the markets. This exhibit will doubtless be seen by more people and you will have the opportunity to get in touch with more poultrymen than you could in any other place or way.

Why Shouldn't Poultry Be As Well Represented As Other Products?

The exposition has a wonderful exhibit from the mines, the fields and the forests. All other branches of agriculture and live stock will be represented as perhaps never before. It is up to you and me and all others interested in the Great American Hen to see that poultry of all varieties be properly represented. The twenty-five judges are among the very best to be had in America, the prizes are liberal, the premium ribbons are invaluable and the show rooms are very large, well lighted and ventilated. Uniform coops, single decked, will prevail throughout and the birds will be cooped and fed by experts. Breeders like Thompson, Fishel and others like them, got their start towards success and prominence as poultrymen, as a result of their winnings at the St. Louis World's Fair. The same results and opportunities await many exhibitors in the Universal Poultry Show. Will you be one to profit by it?

The interest that is being shown in poultry raising is simply remarkable. The Egg Laying Contest at this Exposition and the poultry in the Sales Department, which is superintended by Judge W. S. Russell, are viewed by thousands of people. You would really be surprised at the interest manifested in poultry by the hundreds of thousands of people who are visiting the Exposition each month. It is therefore only reasonable to suppose that the real poultry show in November will attract unusual interest.

Some Educational Features Being Planned.

An effort is being made to get some of the Agricultural Colleges, Universities and Poultry Departments to stage educational exhibits in the poultry show buildings. Congress Hall, a large auditorium in the Live Stock Office Building, is within a few feet of the show rooms. It is properly equipped for lantern slides and moving pictures and it is the intention to hold lecture courses and demonstrations there. If the annual meeting of the American Poultry Association is held in San Francisco. it will probably be held in Congress Hall on the Exposition grounds. This will add greatly to the program and to the interest in the show. With a show like this combined with the annual convention of the American Poultry Association it will make a great meeting that no poultryman can well afford to miss, even if he has to make a trip across the continent.

The Exposition itself is worth a four year's course in this country's greatest university or is equal in value to a trip around the world, if you study the exhibits, the people, and the nations represented. After giving these facts due consideration, I am in hopes the reader will be able to attend the show or will at least co-operate with this department in making this one of the greatest exhibitions of poultry that has ever been held anywhere in the world.

The Rules and Prizes.

Some changes have had to be made in the rules and regulations and you should familiarize yourself with them.

Birds will be received and cooped for exhibition on November 18th to 28th. The entries close on October occupied in judging and re-shipping the birds will be from November 16th to 28th. The entries close on October 15th so all breeders should decide on the number of cocks, hens, cockerels, pullets and pens they wish to enter before that date. It is not necessary to decide on the exact individuals, but you should decide on the number and sex

Ideal Light Brahma Female as adopted by the American Light Brahma Club.

and select new bands to be put on them at the time of shipment.

There is no limit to the number of birds any exhibitor may enter.

No entry fees will be charged for exhibits. A nominal fee of $1.50 for each single specimen and $4.00 for each pen will be charged to cover expense of receiving, cooping, feeding, watering, exhibiting and returning the birds.

Prizes will be paid in full where there are four or more entries in a class. Where there are fewer than four entries in a class, only second prize money will be paid to first prize winners.

Where foreign or other specimens are exhibited, that are not recognized in the American Standard of Perfection, they will be judged by the club standard for the breeds shown, and prizes awarded the same as on standard varieties.

On all breeds and varieties of poultry recognized in the 1915 edition of the American Standard of Prefection and including Guineas and Pheasants, the following prizes will be awarded:

Cock, Hen, Cockerel, Pullet, to each five prizes: 1st. prize, $5.00; 2nd. prize, $4.00; 3rd. prize, $3.00; 4th. prize Highly Commended; 5th. prize, Commended.

Breeding Pen, to each five prizes: 1st. prize, $10.00; 2nd. prize, $5.00; 3rd. prize, $4.00; 4th. prize, Highly Commended; 5th. prize, Commended.

On Pea Fowl, one male and not less than four females: 1st. prize, $35.00; 2nd. prize, $25.00; 3rd. prize, $15.00; 4th. prize, Highly Commended; 5th. prize, Commended.

Ostriches (one male and not less than four females): 1st. prize, $100; 2nd. prize, $75; 3rd. prize, $50; 4th prize, Highly Commended; 5th. prize, Commended.

A fee of $7.50 will be charged for a display cage large enough to hold 10 or 12 birds which are intended only for display purposes.

For The Good of The Industry, Everybody Should Boost.

Begin now to prepare to enter some of your best birds. It will mean a big boost for your variety and if you can win one or more ribbons it will mean hundreds, and in some cases, thousands of dollars, if the winning is judiciously advertised by you.

May we have no knockers, but may everyone boost with the wish that this show may prove to be a record breaker and create renewed interest and greater enthusiasm in the pure bred poultry business in every section of America.

New features, additional facts, the list of judges and other things of interest to the general public will be announced from time to time. I would be glad to hear from anyone interested in this great show.

THE BARRED PLYMOUTH ROCKS

Their Origin, Characteristics, Mating and Breeding. Value of Shape and Color, Etc.

By H. P. Schwab.

Up to sixty years ago a chicken was a chicken, one as good as the other, and none better than the rest. While it is true that there were then several old varieties well known among the breeders of those days, there was no real common law or Standard to guide and they were mainly known as "strains" and in form and often in color and markings they varied according to the ideals and aims of those breeding them.

These varieties and strains were mostly extremes in size; the large and the small, and both with qualities that we wont question at this time, suffice to say that no special interest was aroused over their particular values for the very same conditions existed that had been noted a hundred years before without any progress seen or had.

But about this time, (1850-1860) the idea of progress was dawning and in live stock, improvement was had in horses, cattle, sheep, etc., and in manufacture as well with every industry, keenly feeling the demands of the times. Poultry was no exception, for it had as its champions men who understood conditions and could see far enough ahead to realize that with improved poultry there was a chance for greater success and assured profits.

To attain this, a variety must be had that would mature early. That would make a broiler at the earliest possible age, that at two pounds would make a plump, fine grain and sweet carcass. One that would lay the greatest possible number of eggs per year, and lay consistantly winter and summer. A breed with a constitution fitted to all climates, and climate changes, one full of life and vigor, hardy and reliable. A breed that would be not too large or small, and last but not least, it must have yellow skin meat of superior grain and flavor.

This was the condition confronting the progressive poultry breeders sixty years ago and about the same time several saw this need and began by crossing to produce the ideal they hoped for. How well they succeeded was never fully realized by them, but in a very few years they gave us the results of their work, and called it the "Plymouth Rock."

From that to this day the Plymouth Rock has been received with favor the whole world over for the desires and expectations of the orignators were more than realized, and as long as time lasts, the names of Spaulding, Upham, Drake, Gray, Pittman and Ramsdell will live. They gave us the first American breed of poultry and one that has well earned the title so liberally given, as being the best ever produced.

Their Origin.

The Plymouth Rock, or as it is now known, the Barred Plymouth Rock, is as above stated, the result of several crosses made with the single Comb Dominiques playing the most important part. Black Javas, Cochins and Dorkings were also used, and the claim is also made and is well founded that Black Spanish, light and dark Brahmas and White Birminghams were also important factors in their origin. There is some chance for argument just how these crosses were made, but we are satisfied with the results and at this day don't attach enough importance to this to argue our opinions; suffice to say that the crosses were made with the varieties stated and the Dominique male was used for the top cross as a rule.

The Plymouth Rocks were first brought to public attention and exhibited at Wooster, Mass in March 1869, and from that same date the success of "Standard Bred Poultry" was assured. They are the very foundation of "better poultry" and have made possible the success of the great poultry industry, as we know it today. Merit alone placed them leaders then and merit alone has kept them to the fore ever since.

Their Name.

From their introduction, and for a great many years after, they were known simply as the Plymouth Rocks, but with the introduction of the White Rocks the name Barred was added to designate the variety. Now all told there are six varieties of this breed.

Characteristics.

The Barred Plymouth Rocks combine the qualities desired in a general and all purpose fowl. They have characteristics all their own that we have failed to find in other breeds and varieties to the same extent. The quality of their meat is the best and always has first call for the buyers. They mature and begin to lay early and regularly. They can be grown to a given weight or size as quickly as any known variety, and when we consider with this their superior grain and flavor of meat, we do claim that herein they stand alone and unapproached. Still it is as layers that they are probably best known for they have the faculty of laying regularly, the year round, winter and summer they keep at it while changes of climate or conditions has no apparent effect. They grow, they thrive and they lay under most extraordinary conditions of care and housing, and most constantly, both winter and summer. To sum up, they are a striking example of general quality and general value from every view point.

Back of all is their rugged constitution with a hardiness that insures for them all our claims and increased favor with the farmers and breeders for time to come.

Advantages of Standard Poultry.

There is much to consider in poultry breeding, and the advantages of breeding throughbreds along standard lines comes first in importance. The Standard adopted for all recognized varieties by the American Poultry Association should always be our guide. Its rules and demands in form are what nature intended for each variety and at which we find them at their best. It is most reasonable to believe that the demands of nature must be

followed for best results, and the breeders have seen to it that the form and type adopted are nature's demands follow its dictates.

This applies to all alike who expect to find money in poultry and would appeal most strongly to those making a specialty of eggs and the market poultrymen. The egg specialist could demand the best prices with even colored and formed eggs and the marketman would also find his greatest advantage in the eveness of the carcasses in size, color and quality.

With this also let us consider the advantage and profit for the breeder in selling eggs for hatching, and birds for breeding and for exhibiting at well paying prices. The greatest and most successful poultry farms of today all grew from a very small beginning and I would particularly urge the reader to consider this and to follow on for the goal is within the reach of all who will but try and under far more favorable conditions for you than they had.

Male Shape.

According to the American Standard of Perfection, which is our guide in all things in poultry. Shape is in total value, greater than that of color, in about all varieties, and as shape, or as we will often call it type, is so very important, it would be well to consider it most carefully. It is a well known fact and also a most truthful saying, that shape makes the breed, and color the variety. This holds good in all breeds and in all varieties and again proves, the superior worth and value of correct shape.

It must be evident to all, that have made a study of style, that there is nothing more difficult to properly describe, and to have it well and correctly understood, than is shape, therefore I would suggest that the breeders compare description and notes with their own birds and also the Standard illustrations and other illustrations they may have of noted winners. The advantage in this will be that shape facts will be more strongly impressed in mind and that many references will be better understood.

It is not the excellence in one, or a few sections, that go to make the finest or most valuable specimen, but it is the specimen that shows a high average in all sections, both in type, color and in proper markings, that will win and prove the most valuable as a breeder. We must not in breeding live stock be a "faddist" for any one point or section, but must well look to all sections and know the comparative value of each in breeding value, for here lies the greatest merit we can hope for.

Head of good size and in proper proportion to size of bird. It should be broad, thick and of good length, with a rather round appearance when view from the side. A broad, deep and full skull denotes stamina in the specimen. Avoid the long narrow head, usually called the snake head for it is very improper and should not be tolerated. We often see it and also find it colorless, a bad liver is back of that and no vigor. The shape of the head is also very important for it carries with it all the value of first and general appearance of the bird, and to the expert a poor shaped head at once destroys the whole appearance of what otherwise might have been a handsome specimen.

Beak, rather short ,well curved and strong a rich Golden yellow in color. The beak should begin to curve where it leaves the head. The long straight beak that simply curves but little at the extreme end is very incorrect, so is a horn colored beak, or a black one, still it is more important to have the male beak of extra good form and color than that of the female.

Eyes, large and full showing prominently. In color, red, reddish-bay. or bright bay, the red much preferred. The eye is one of the chief characteristics of the Standard bred Barred Plymouth Rocks, and in breeding value is about as important as any one section, and far more so than many of them. We always see much to admire in the large eye with the large pupil; it is expressive and gives the bird the appearance of knowing something more than mere chicken chatter. Weak colored, green or pearl eyes are almost a deformity showing a delicate, constitution and very poor breeding in most cases. Avoid these and always be very particular in securing and breeding from specimens with the striking red eyes, and you will have a vigorous bird, the only kind worth while.

Comb—The comb should be single and proportionate in size with the specimen and being a part of the head is one of the most important sections of the bird, both in value, as well as far as looks are concerned. It should be straight, upright and well set; finely pebbled and with five even and well formed serations, the top of which should conform with the shape of the head, texture fine and the rear or blade of the comb set free from the head and neck. The comb from the front to the rear should curve gracefully, forming nearly a half oval over the head and being highest in the center. A fine shaped comb has a crowning effect and adds much to the general appearance, while an uneven, twisted or thumb marked combs are serious defects and are to be avoided. Side sprigs are a disqualification.

Wattles----The wattles should be even in length, of fine texture, nicely rounded and free from all wrinkles.

Ear Lobes:----Smooth, of extra fine texture and oblong in form. Proper and well shaped and carried wattles and lobes add much to the head appearance of any specimen. The comb, face, wattles and ear lobes in color should be clear and bright red.

Neck:—To be correct should be proportinately long, full, and well arched, tapering, and with a full abundant and flowing hackle. Nothing makes a specimen look more out of proportion than a slender, long thin neck, that are also usually poorly feathered. The neck of right length, gently tapering, arched and with fullness and length of feathers add the desired finish expected in the majestic specimen.

Wings:----Are of good size and carried well folded with the front and rear covered by the breast and saddle feathers. The feathers should be straight and uniform while twisted feathers or spilt wings are defects to be avoided at all times.

Back—In back we have also a very important section to consider, for its shape is really the one great and important characteristic of his or any variety. Being of such value we quote in full the Standard description to avoid any possible chance of an error. In fact, as the American Standard of Perfection is our law, I quote from it often and use parts of its texts where most desirable. Rather long, broad its entire length, flat at shoulders, nearly horizontal from neck to saddle, where there is a slight concave sweep to the tail; saddle feathers rather long, abundant and filling well in front of tail. These are the Standard requirements and best cover the question at hand, the long back full and nearly flat at shoulders is the Plymouth Rock characteristics and carries with it the breeds greatest value and in this we also find the chief difference between this breed and the Reds, Javas, Wyandottes and other varieties.

Nothing short of the above description fills the Standard requirement and it is very essential to most closely follow this form if you wish to reach the highest type in breeding and breeding value.

Do not confuse the meaning of words used, avoid extremes in them, for they mean just what they say and imply and no more, and should be strictly adhered to. The saddle feathers long and abundant add the finish so much desired.

The tail feathers are another important factor, both in its shape and carriage. Improper in either of these it mars the entire make up of the specimn, but when proper it adds the finish and appearance so greatly desired. The tail should be of good length, full and well spread. The Standard says carried at forty-five degrees from the horizontal and forming no aparent break or angle with the back. This gives you the specimen with a sweep to back and tail in opposite and as stated without any apparent break. The sickles feathers should be long and well curved over the tops of the main tail feathers, with secondary sickles and coverts abundant and well covering the main tail feathers at sides and base. The tail should be well spread at the base and have a rather full appearance when viewed from front, back or sides with this desire properly met. It also adds to give the back the desired sweep and finish called for.

Breast—This has always been considered one of the strong points of the Plymouth Rock as a table fowl, for plenty of breast meat is an important desire in the all purpose fowl. The breast should be deep, broad and full and be carried well up and being well rounded its whole appearance is one of symetrical fullness. In breath and depth and being well rounded we avoid the blunt or extreme blockiness as well as the shallowness which are all undesirable.

Body and Fluff----The body should be of good width, long and deep to the rear with its length; it should be deep and full with no rounding or blocky appearance when viewed from front or sides. Good length is most essential to proper body shape with the all round even fullness.

The fluff should be moderately full and well feathered but not loose feathered.

Legs and Toes:----Thighs large heavy and full featured.

Shanks of proportionate length, smooth and straight. Toes strong and straight. The legs of good bone and set well apart. In color the legs should be a rich yellow.

These are the points that tend to make the ideal male in shape. Combine them and you have a symetrical male in general formation that has made possible in this variety a leader among the general purpose and most practical varieties that best have met the demands for a profit insuring breed for upwards of fifty years.

Female Shape.

While the general description given above for the male shape touches on the correct female form also, still there are several features of the female type that require further and special mention. Here also I wish to refer you to female illustrations for reference as before noted for the female. Shape is just as important in every section, and in every way as that of the male.

The comb should be well set, small and finely serated and even, with five sections, the tops of which should form a straight line upwards from the front to the rear, while five serations are proper in number, more or less should be discounted at half a point each in value. The wattles and lobes also should be small, smooth and conform well in appearance, and in size, with the comb and head points. In other words they want to be in proportion much smaller than is required in the male.

The head should in general appearance be strong and broad, well filled and with a broad and deep skull, not coarse or angular in any way. Eyes red, and color of face, comb, wattles and lobes red. Positive white in either of the lobes of male or female, disqualify the specimen. But it must be positive white; paleness caused by condition is only a defect to be cut accordingly. The beak, short and well curved, yellow in color.

The neck should also be proportionately short, arched and tapering. A nice formed head with a rather short neck, well arched, add the grace most desired to the female appearance, and with this variety are characteristic which has been well understood in breeding.

Wings like those of the male, well folded and carried rather close.

The back of the female is just as important as the male back, while it should be long, avoid the extreme, still its appearance is longer than that of the male and it should also have that upper concave sweep, being broad and full and nearly flat forward at the shoulders. The outline from the upper portion of the female, that is the head, neck and back is a study and difficult to obtain near to perfection, but when had, its true value is most priceless.

The tail of the female is a section seldom seen in any degree approaching the ideal and but few of the illustrations seen give the correct idea of the proper shaped and carried female tail. The fact is, that many females seem deficient in this respect but when seen at its best in a high grade specimen, it adds the finish and a beauty to the general outline that will never be forgotten. The Standard demands that the female tail be carried at an angle of 35 degrees, or just 10 degrees lower than that of the female. It should be of good length, well spread, full and inclined slightly inwards toward the tip and being well filled under.

In breast the male description answers perfectiy the female requirements.

The body should be long and conform to the shape of the back, with this same length, proper proportion of depth and breath must be had with plenty of fullness. For legs and toes. we again refer you to the description above given for the male.

Color and Barring of The Male and Female.

The comb, face, wattles and lobes of both male and female, should be red, and the beak and legs yellow. The male beak is usually very good in color, but at times we do see some with black striping, while this is contrary to the Standard demands, it is not over harmful in breeding, still we would much rather see the male beak a pure and rich yellow. The female beak as a rule carries in it more color, and it is very seldom that we see a positive rich yellow beaked female, for as a rule they have more or less black striping, the less the better for any of it must be considered a defect in some proportion. This as well as the dark spots so often seen on the legs, which are also defect, come most likely, from some of the early dark crosses made, and presumably from the Black Javas and Spanish, which were a prominent cross in their origin.

Plumage Color:—It is so necessary and important to convey the exact requirements of the Standard to the reader, that we hope to be pardoned for again using the full description as given in the American Standard of Perfection. As that work is our guide, and its text has been properly written after years of study, we fail to find other words than those therein used that would adequately give the same understanding. This work could not be written to carry with it value unless a liberal use of the Standard text was made.

The required plumage color as given is greyish white, each feather crossed by regular, narrow, parallel shapely defined, dark bars that stop short of positive black; the feathers are to be free from shaftings, tinge of any color or metalic sheen; the light and dark bars are to be of equal width and to extend throughout the entire length of the feather, and in all sections of the fowl, each feather on the female ending with a narrow dark tip, the combination of over-lapping feathers, giving the plumage a bluish appearance.

This is the Standard requirement, and while we are not given to criticise, we have noted that the nearer the light bar approaches the pure and positive white, the sharper and better contrast is had and this to our notion to its advantage. The inter-mingling of colors, cannot be approved, although we often see the dark bar carry its colors; it shows into and through the light bars.

Broken bars, i. e., bars that do not run straight across the feathers are very often met with and are very incorrect. The barring should be narrow with the light and dark bars of equal width. Narrow in all sections does not carry with it the same rule for all sections, for the narrow bar required in the neck of male and female and in the male saddle would be out of proportion of what would be considered narrow barring in the longer and broader feathers of the back and breast, therefore, we would consider narrow barring in proportion to the length and width of the feathers and its sectional demands.

The tip bar of the female should be dark. Don't overlook this demand as it is of vital importance in the general appearance and finish of the specimen, and you cannot have the correct shade without it.

You will note in the Standard description that the feathers should be regularly barred throughout their

Everybody is always pleased to see S. C. White Leghorns as bred by Mr. D. W .Young, Monroe, N. Y. His home is the Mecca for poultrymen daily the year round, while at the New York Show the public is always dense in the Leghorn isles to see the (D. W. Young) winners. Above is shown one of Mr. Young's finest productions. A great winner and a bird of exceptional breeding worth.

H. P. S.

entire length and in all sections. Here is where under-barring or as it is commonly called, under color comes to notice. Much has been written for and against under barring, but I have seen no good reasons advanced for a change and do hope that our standard will always contain the same demands as now. It has been fully proven that under barring can be properly bred and I am convinced that proper under barring also carries with it many other desired qualities besides that of the highest and richest possible shade of surface color, that is, had only in the well under barred specimen, also from observation and experience we know it carries with it in breeding both males and females special values that largely tend to eveness and cleaness of color throughout and we may add that is most essential in the female line of breeding.

It is rather evident that for many years the wrong impression has been out among the breeders. Some seem to think that anything outside of positive white is under color, and we have seen breeders referring to specimens that did not show a particle of under barring but were dark and hazy as being of good under color. This is very far from being correct and the text of our late standard has done much to correct this error. Under color at all times means under barring, and the fowls to be proper under, must be regularly and evenly barred to the skin.

In general color the Plymouth Rock should have a blueish appearance, not an extreme in either way in light or dark but a high rich and even shade from head to tip of tail. In the correct shade of color and eveness, its greatest beauty is seen.

A metalic sheen is often seen and particularly in the stronger colored males, in saddle and tail, this is a serious defect, for it not only breaks the eveness demanded, but introduces foreign colors and shades that are not wanted at any time or place.

The saddle and hackle plumage of the male is often found defective in barring by having what is commonly called "V" shaped barring. Barring that does not run straight across the feathers in those sections. This "V" shaped barring runs downward and outward from the center to the side and tip and is very incorrect and defective. I call particular attention to these points, not only that the reader will understand the common defects met with but that he will closely observe and memorize just what the standard demands.

(To be continued.)

RECLAIMING THE MINORCA

A Fowl of Solid Worth That Should be One of Our Most Popular Varieties. Its Breeders Should Get Busy and Popularize It.

By Louis P. Graham

There is little to disturb the average breeder beyond a slight difference of opinion between the relative values of type and color in judging. We find some breeders and judges who have their hearts set on rich beetle green sheen and, with such wonderful type carries no weight unless the fowl is green in all sections. This revives the old contention of "shape makes the breed and color the variety" but it is difficult to get all breeders and judges of all varieties to write on this at present, although it is safe to say that the opinion of the majority coincides with the quotation. Until all are united, the awards in our shows will in some cases favor type and in other color, regardless of size and type and the usual discussions and arguments among breeders and judges will follow.

Minorcas, especially the Blacks, have long held the reputation of wonderful egg production, and their eggs, for size, are yet used as a Standard—"almost as large as Minorca eggs"—how often has the expression been used? Nevertheless, this breed has been steadily declining in popularity despite its many admirable qualities. Its chief critics claim lack of vigor and for this no one but its breeders are to blame.

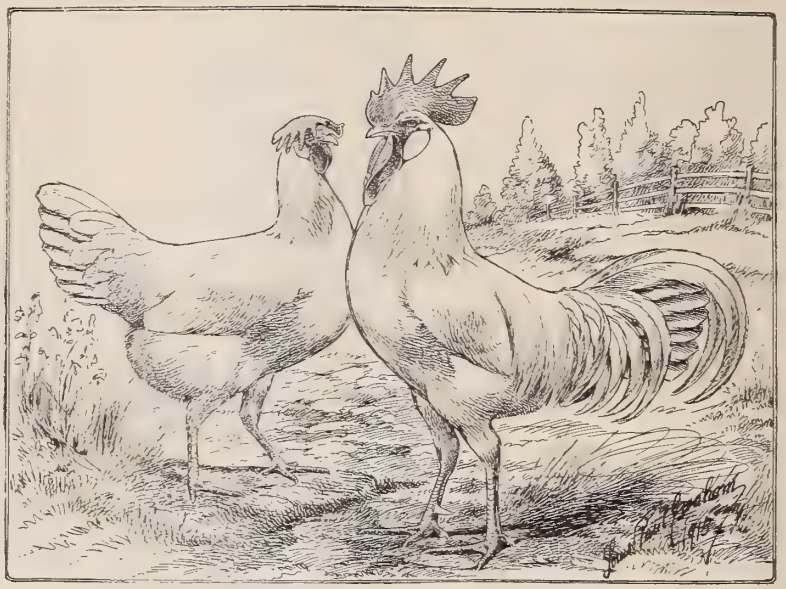
For many years it has been the custom to breed and to exhibit otherwise splendid specimens with slightly roached backs and with knocked knees, both of which indicate lowered vitality. Because of their other good points, judges have shut their eyes to these decidedly weak points and awarded prizes which have encouraged poultrymen to breed these deficient specimens. This has encouraged and bred into the fowls a pair of serious defects which make for lowered vitality in the chicks. The only remedy for Minorcas to regain their merited popularity is to breed them again, possessing that ability to grow vigorously and be vitally strong.

Breeders and judges must "prune" with a heavy hand. By refusing to place premiums of any kind on a fowl showing breeding defects, the breeder will be restrained from exhibiting, and in turn breeding such specimens and in a few years Minorcas will show their old time vigor and vitality and be worthy of the best efforts of any man who wants eggs in numbers and fowls of good size.

This method has been successfully tried out on other breeds and has resulted in a great advance in a breed. It will do as much for Minorcas.

Black Minorcas have been very popular in the mining

regions of Pennsylvania and many magnificent specimens have been produced there. They are also bred by the thousands on at least two Pennsylvania farms and one



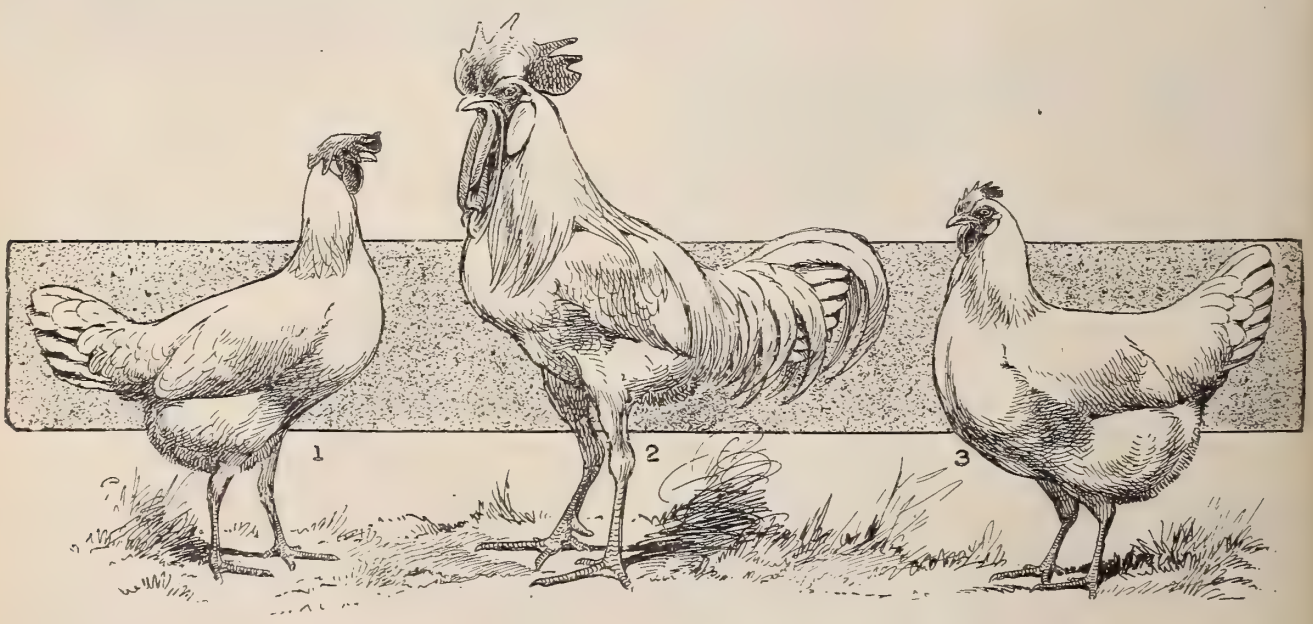
Minorca male and female of near ideal shape.

farm in New York. They have many admirers among the smaller breeders. Their backers are all good fanciers and it seems as though there is no reason in the world why these good men should not get together, determine on a policy of "survival of the fittest" and return this grand old breed to the state of vigor and vitality, which will make them equally desirable with White Leghorns for the stocking of commercial white egg farms.

In Standard points there is great uniformity in the breed and little left to do to improve the fowl beyond the suppression of those who place color above type in awarding prizes.

White Minorcas have never had a great hold on the American breeder. Possibly they are to close to our White Leghorn in many characteristics to be desirable.

Other varieties such as Buff and Barred Minorcas have been originated and offered to the public, but few specimens of worth have been exhibited.



Some imperfect types seen in our shows.

No. 1 represents a slim type of female which often wins in the Minorca class excepting of course they are less decidedly "roached backed" than is here shown. This is hardly to be considered good Minorca type

No. 2 shows a type of male often marked up as a winner overly heavy and coarse in comb, lobes and wattles, often with comb slightly if not decidedly lopped, wattles long pendulous, coarse and heavily folded, lobes long and coarse in texture. The extra heavy weight in head points, forcing the fowl to rest them on his breast and assume an awkward angular carriage in order to maintain his equilibrium.

This shortening of the neck forces the hackle to spread out thinly in all directions over back, wings and breast. This type of male is often knock kneed, partly from inherent weakness and careless breeding and partly from his attempt to balance a much too heavy head.

No. 2 also shows a "roached back" often overlooked or treated lightly by judges of this breed. It seems as though a strict application of Standard disqualification to this breed (deformities of any kind) which would include roached backs, however slight, and knock knees, both of which are serious breeding defects, would be vastly beneficial to the improvement of Minorcas, both in vigor and carriage.

No. 3 illustrates the type of hen which won 1st place in a big show solely on account of her wonderful color. She was a black of wonderful beetle green sheen, absolutely free from purple. Robbed of her color, she fails to measure up to good Minorca standard. A soft feathered fluffy short legged fowl of extremely light and weak head points, it would be hard to place her as a Minorca in type.

The poularity of all Minorcas depends on the blacks and it behoves all Minorca breeders to get together and work for a solid improvement and boost it to popularity.

Just to show the world that his S. C. White Leghorns were not bred to only win Highest Honors at the Great New York Show, Mr. D. W. Young exhibited at Boston's beauty show and won a record there of superior value with his usual superb quality. Above is shown his first prize pen, a good winner in a great class. This pen matches in style with the best type in which we can see undoubted quality in reality. We would accept this kind with the assurance of practical value and worth in every bird. P. S.

OUR GUARANTEE.

We guarantee every subscriber against loss due to fraudulent misrepresentation in any display advertisement appearing in Everybody's Poultry Magazine providing the subscriber when ordering the fowls or merchandise states that the advertisement was seen in Everybody's Poultry Magazine and places the order during the month or months in which the ad is inserted in our columns and notifies us of the fraudulent misrepresentation of the advertiser, giving full particulars, as soon as it comes.

SUBSCRIPTION PRICE.

Fifty cents the year. Three years for $1. in U. S. and Mexico, Canada 25 cents per year extra. Foreign countries 50 cents extra.

A Renewal Blank will be inserted when sub. expires.

ADVERTISING RATES ON APPLICATION.
SAMPLE COPIES sent free to all interested Subscription Agents wanted.

Manuscript and copy for change of advertisement must be in our hands promptly by the 10th of the Month preceeding date of issue. New Business can be accepted to the 20th but no special position can be assured.

What is "UTILITY" in poultry? As it is being used and applied now-a-days it seems to mean most anything and everything, it covers the entire field with one grand sweep, without questions asked, or answers given. The mere statement that those are choice "Utility" fowls will insure sales, profits, and another buyer "stung" in nine out of ten cases. We have every reason to believe that there is more faking today under the guise of utility, then has ever before been perpetrated upon the poultry breeding public.

We earnestly believe in utility poultry, in the kind that has been bred for utility quality, and has qualities that commend themselves, but we do not believe in the kind that is being paraded so commonly at this time, that has no breed characteristic, that has nothing but the assurance of the seller—that there is utility value in them, beyond that there is practically nothing of more value in them, than is found in any grade mongrel.

There are reliable utility lines of stock in the several breeds that we can and do commend, these have years of breeding along Standard lines back of them that insures the greatest possible productive qualities. They have been mated and bred for results with a positive record kept, and they are today all that is claimed for them. They are in line and breeding thoroughbreds and well deserve every consideration. Back of them also is the substantial breeder whose record is known and in whom we all have confidence. This kind of stock insures profit to everyone who will breed them with a purpose in view and follow the lines that produce them.

"UTILITY" as we accept it and know it, is a far reaching word, that must necessarily include the entire make-up of that to which it is applied. It means in poultry far more than mere egg production. It means proper breeding with health and vigor, quick growing and early maturing capacity, it means quality in meat, as well as in individual worth, quality to reproduce its like in size, form and in egg production, eveness in great numbers with a high per cent of similarity, etc.

With this also we demand the assurance for the future, that the quality of today will at least be reproduced, or improved upon, a most reasonable condition to expect. What assurance of this kind can the many so-called breeds and strains now recommended give? Breeds and strains that in no way resemble in shape or form under which they sail, whose displayed records of past performances was blown sky-high by the general failure of their off-spring to making good. Next year, there will be the same story to tell of those wonderful birds of today, and so on as long as some remain to bite at this bait.

Utility as applied to Standard bred poultry is the one safe and reliable kind to bank upon, the lines of the various breeds as they are bred today show reliable progress, they show more general worth in egg production, form and size, health and vigor, with fertility and above all the quality to reproduce their quality, than ever before. Still their limit has not been reached, for with careful selecting and handling with proper sorting they can still be improved, and we are pleased to note the work of the breeders in this line and the results.

A few years ago we saw the records of a flock of Barred Rocks that had been specially bred for utility quality for over twenty years, and if memory serves us rightly, their average

for ten or more years was in the neighborhood of 190 eggs per year for an average flock of 500 or more. About this same time we inspected a flock of 2,000 White Wyandottes whose average record for three years was 186 eggs per hen per year. Both these records we believe for there is reason in them, and both these flocks were of a particularly high Standard quality stock, bred true to shape, size and color.

We have every reason to commend Standard bred poultry, bred to the highest state of quality for general results, for it is most reasonable to expect paying results year by year from them. They best meet the general demands for their form is a natural one, at which they surely are at their best in productiveness from every view point. Standard bred poultry, bred to a high standard of quality, will insure paying results year by year, it is good this year and next for ages to come, always with the chances for greater results and improvement.

"Tupper" says "Economy," is the poor man's mint. We all commonly accept economy to mean Frugality, in the use of money, time and labor. To economize is to be prudent and simple economy is well and good as far as it goes, but when practised for the sake of economy alone it is a failure in-so-far as it may concern future progress.

We love economy, we advise economy, but always with a few grains of thought and consideration for the future. There are times when saving is economy, and there are also times when spending real money is the best of economy. Economy is a part of system, of business and where applied is sure to show results.

Let us here consider economy as it applies to the Poultry Industry at this time. Here now we have hundreds of thousands of poultry breeders throughout this land willing to improve and desirous for success, they have figured out the possible result, they know their capacity, and they are just itching for the opportunity to try out their matured plans; some hesitate, and with it their opportunity and chance for success vanishes, while others who have more of the "Get There Spirit" in their make-up, plunge, grasp the chance, try and succeed.

Economy is shown in both above cases, it was the making of the one, while it was the reverse with the other for the reason that economy to him was simply to save, and sad to relate that in this and like cases of which there are many, he saved himself from success.

It is wise economy to improve your stock, if you intend to remain in the poultry business, this being the case, it is the best of economy to improve and to buy NOW.

At this time of the year, with the hatching season nearly over, most breeders have for sale a share of their breeding stock that can be bought far below their regular value, stock that they would not of sold three months ago at any price; this stock represents the best blood lines and in most cases will be of greater value in another year than it was this season for breeding purposes.

This is the season of special sale lists and prices, and we strongly advise our readers to economize by buying what they will require now. Look over our list of advertisers, they are reliable and responsible breeders. Write them your wants, and of course mention "Everbodys" to them.

The average poultryman is in a class by himself as an advertiser, he comes and goes, then returns again to plunge, and in the end wonders why the returns have not been more profitable to him.

The real trouble is that he follows the plan adopted by others in ages past, he does advertising partly because others do, when they do and how they do, to a more or less extent, he loses his individuality entirely, and simply for the reason that he follows a worn out plan that never brought anything to anybody we know of.

All advertisers are not alike, the exceptions are the ones that have made progress, who have advertised at all seasons, and particularly strong when the others have laid down on the job. It has been a general custom for years with many breeders to reduce space in May and June, at the very time when the hatching season is but partly over, and they are loaded to their gun-wales with surplus breeders, that somebody surely wants, and a great flock of young coming for which room is required.

The consequence is that much of his stock is sold to the market at so much per pound, while there are many beginners and breeders throughout the country that would appreciate this stock and would willingly pay a good fair price for it, if offered for sale.

Those poultrymen who have issued special stock sale lists and who have advertised well, as long as they have had reliable breeding stock to offer for sale, have made good, they are making good every day. Just lately a breeder told us: "I have nearly doubled my advertising for years at this season when others have laid down, the result has been in greater sales and in doing business year round. My annual special sales have been enormous and increase year by year, they also reflect and help my business at other seasons for it popularizes a line and creates more and new demand for Standard bred stock."

Here is advice frankly given by one whose success is well known, it is based upon results, therefore is the kind to follow. During the next few months buyers will be scanning the columns of "Everybodys" for Special Sale prices on breeding stock, then this is also the beginners season, they are ready to buy and to improve their line and they well realize that this is their time to invest.

There need be no dull season for the progressive poultryman, they who have stock to spare

should properly advertise it, it is up to them to get what it is worth and now is the time. Prospects were never better then they are right now, business conditions are still improving daily and we have every reason to have the greatest possible confidence in the future.

The new Standard of Perfection is daily expected to arrive at our office, it really does not matter much, beyond the fact that we are all very curious to see it, if it does not arrive before August 15th, but we do want it by that time to digest at least parts of it before the next show season opens; we also want to give the committee who have worked so hard and so long due credit for their labors.

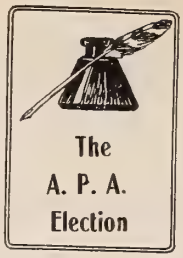
This Standard will be our breeding and judging guide for the next eight years, and we have every reason to expect that it will be the best and most complete Standard ever published. We do also regret that it was not issued early in the year, when promised, and in ample time so that the breeders could of had it in hand and mind when mating. Those who do not know of the changes made (and there are many of them) will be handicapped for a year or more in their breeding, to all of us their is nothing more valuable than time.

While we know of no really radical changes made in its text, we do know of several changes that will materially effect the future mating and breeding of several varieties, and this of course will be to the disadvantage of the breeders. There may be the best possible excuse for the delay in its issue, but what that reason is, we do not know.

It is our opinion that this will be the last Standard that will be compiled and issued as this one was; that there is chance to improve the mode of compiling and issue must be evident now. The work has reached immense proportions, with a corresponding great cost and expense, which increases the price and tends to make the whole work less popular then we would like to see it.

Let us look to the Specialty Clubs in the future for this work. We have always contended that the officers and members of the specialty clubs, who are experts in their several breeds, are best fitted to make the standard for their varieties. Beside being experts, their interests are centered in those varieties and they can be depended upon to suggest a standard that will not only be right, but popular.

In this we believe that two-thirds or more of the expense now incurred could be saved the American Poultry Association, money that would come in quite handy for several purposes that would be a special advantage to its members, and to the industry in general. Beside this, this seems to us to be really the most practical way. It is a long way to the next Standard, still it is well that this, like all other questions have due consideration.



The result of the annual American Poultry Association election was just about what was expected, there being no contest except for Vice-President, time of meeting and meeting place. Mr. E. E. Richards, Cedar Rapids, Iowa, was elected President and received 2,296 votes. Mr. A. A. Peters was elected Vice-President, receiving 1,543 votes, while Secretary Campbell was re-elected with 2,150 votes.

San Francisco was selected as the meeting place with the second week of November as the time.

This is very gratifying news indeed as it insures a big meeting for the A. P. A. and we also hope the largest and grandest display of poultry ever brought together for the Universal Poultry Exhibit to be held in connection with the Panama Pacific Exposition.

President-elect Richards requires no special introduction from us. His years of service in the ranks, as well as in most every position of confidence and trust in poultry work, and particularly his work as Editor and Publisher of the Western Poultry Journal is known. He is a sincerely capable man and we look with every assurance for his administration to be one of progress and brilliant success. We are happy to congratulate the American Poultry Association and its members with the best of good wishes for all.

The Universal Poultry Exhibit that will be held in connection with the Panama-Pacific Exposition, at San Francisco, California, about the middle of November, promises to be the greatest and most spectacular exhibit of poultry ever seen. There is ample cause and reason for this and we hope that our prediction will be fulfilled.

The Exposition is now open. While its attendance, its exhibits and its features are far greater than those at any previous "World's Fair," its value also must be considered in the same way. It is an object lesson of our "Greatness" as a nation and as a people that is bound to have a wholesome effect on our business and lives as well.

While the exhibits are of surpassing value and beauty, carrying with them the pride and confidence of those interested, it is up to us as poultrymen, to make the Poultry Exhibit there of highest possible worth and of greatest value. The poultry exhibit should at least be on a par, or exceed in brillancy that of any other special display.

It is within our power to do this, so let's get busy and accept this advantage to show the world the great American Hen representing one of the two greatest interests in this country in value.

See America First, is a broad minded slogan worth following by all that possibly can, for a

trip to the coast is one worth while. The best possible rates ever secured are offered and we hope that hundreds of poultrymen will make a special effort to visit the Exposition at the time the Poultry Show is being held there.

In this issue we publish an article by Mr. T. E. Quisenberry, who has been appointed Superintendent of Poultry, in which he gives particulars and information of interest. Other bulletins will be issued and those like this one, we will be glad to publish for the benefit of our readers.

Several States are planning to offer special inducements to their breeders to exhibit; some have already done this, and we trust that all will do so to insure proper representation. This is a national affair, one of concern to every state and section, and to every breeder, so we look with confidence to poultry to receive its due, and to have an exhibit that will conform in prestige to the value of its industry.

With Mr. Quisenberry in charge of the poultry department, the best of management is assured. His many years of successful work as superintendent of the Missouri Experimental Station, also as secretary of the Missouri State Poultry Association, well qualify him for this position.

There is unusual reason in our reference to "EVERYBODYS" at this time, day by day poultrymen (and the ladies too) almost without number are writing and telling us how well they like "Everybodys" and in most of the letters are sending us the subscriptions of neighbors and friends, so that we feel quite at liberty to publicly acknowledge this and to briefly refer to ourselves, to our business and to our progress, which is of interest to so many.

This condition is just as we wish it to be. We want "Everybodys" to interest the public, we wish the people with us, not only as subscribers and readers, but in interest as well, such conditions are conductive to progress in its highest forms, that is the grand goal we are striving for.

Our subscribers receive our first consideration, their requirements come first and foremost; how well we have taken care of them is seen by the class of articles we are publishing. We have insisted upon these being the best procurable, original and thorough, written by experts we know to be fully reliable to follow.

Our advertisers are of the same class. They are breeders we know to be reliable, for we guarantee every one of them. Our readers like ourselves, have perfect confidence in them. That they have "The GOODS" is commonly known, while they absolutely guarantee satisfaction to every customer. This in a measure accounts for the paying results these advertisers have received from "Everybodys" and the unsolicited reports they have sent to us.

During the past two months we have received over 9,000 new subscriptions,a great share of which were sent in by our readers who have so kindly recommended "Everybodys" to their friends and neighbors, for which we are very thankful indeed. These are the kind of subscribers we want, they are live ones who are active in breeding and who seek to improve their stock and to breed some of the best.

Let us here urge all friends of "Everybodys" to keep at it, we need their assistance to be of greater worth; there is no limit to our possibilities or to our ambition, we desire our circle of readers to keep growing, and to be the largest and best on record. Please keep right on recommending "Everybodys" while we will keep right on making it greater, grander and better monthly.

The European war still continues in unbated fury causing a condition of severe unrest and expectancy the whole world over; never before, as now, has the "Earth Trembled." The severe strain is telling, while the result and the future can't even be hinted at, for nobody knows what time will bring forth. Just at this time, more than usual, and evidently to keep in harmony with the troubles abroad, there are several squables on between some of our Poultry Editors, and between Editors and Breeders with attacks and counter attacks and with flanking moves that bid to keep things lively for time to come.

We do not believe that some of the questions that are being exploited in a more or less vigorous way are conductive to the best interests of the poultry industry. Still this is their business, not ours. They can keep it up just as long as they wish, while we will just tend to our "knitting," give them all the room they wish, and in our own way, will try to keep our readers interested in poultry culture. Our one and first duty is to our subscribers and advertisers; they have paid the price for a Poultry Magazine, with poultry news and articles, and we intend to give them this to the best of our ability, with as little of our personal affairs as it is possible to give. There is plenty of sound and wholesome poultry news at hand for all, and it keeps us pretty busy finding space for a share of the good material we are receiving.

In this we don't deny the right of the editors to fill their pages as they wish, with what they wish, as long as their readers will stand for it, but we do want to see the first principles of "fair play" carried out fully. Some are evidently shy on this point; they hand out severe knocks, offering no possible chance for a comeback, that to our notion is "NOT" justice. Thanks, the American people are not hasty to form opinions, they want both sides and all sides of every question fairly stated. When they have had that, they will then form their own conclusions.

Let us boost when and where we can, let us faithfully work for the uplift of the breeders and the industry, let us have peace and ever work in harmony for general success.

June Work

June is one of the two best months in the year, in which to hatch quality chickens, for producing color; we believe it to be the best of all times in which to hatch. June hatched birds have been the leading winners for years past at our largest shows where the fine points count and where competition is the strongest. Look up the records and you will find that, in particolored varieties in particular this is a well known fact.

A good share of your June work should be devoted to hatching, when this is done, there are the chicks to attend to. Don't slight them in any way, for no matter how much care and work you devote to them, there will be substantial return for all. A variety of wholesome food, fresh water, clean dry coops, with supplies of grit and charcoal within reach.

All fowls require shade, if you haven't arranged for this, do it at once. Plant some corn and sun-flowers, they will supply shade and protection as well.

Clean out the coops and spray them thoroughly, dust the setting hens and see that the chicks are kept free from lice of all kinds. Disinfect well and particularly the brood coops; move them about so the chicks can have fresh sweet soil to run over. Spade or plow up the grounds where fowls are kept yarded. This should be done every two or three weeks.

The breeding season being about over, advertise your surplus breeders, somebody wants them and you will not find a buyer unless you look for one.

Now is also the time to do your repairing and building if needed, fix up things at every opportunity, then it will be done when you will have need for it, arrange for ample space and avoid crowding with the old and young.

Feed carefully and regularly. Don't waste food by throwing it around the lot in handfuls where rain and sun will damage it. Feed from hoppers which assure clean food and no waste.

Keep your eyes open, observe conditions, and profit thereby. Try for better poultry and success.

A BILLION BUSHELS.

In striking contrast to the despoiled condition of war-maddened Europe is the yield of a billion bushels of wheat which the May crop report indicates will be the result of peaceful husbandry in the United States. Our farmers naturally planted more wheat last fall because of the high prices having sowed 5,210,000 acres in excess of the year before, or 41,253,000 acres altogether. Only 1,094,000 acres of this have been found useless to leave for reaping, which represents the smallest winter loss in 15 years. Experts figure that the remaining 40,169,000 acres will yield 698,000,000 bushels of winter wheat,

Spring wheat has been too lately planted to admit of definite figures, but the three Northwestern States report a 10 per cent. increase in area sown and that the promise is for a yield above the average. It would be necessary to raise about 307,000,000 bushels of spring wheat to bring the total yield up to the billion mark. Only 206,000,000 bushels were harvested last year,, but the yield in 1912 was 330,000,000 bushels, or more than the amount required to make the billion mark. This is not an unreasonable assumption when it is remembered there is a large area sown.

This billion bushels of wheat yield not only means the secured prosperity of this country, but it gives us an opportunity to feed the clashing peoples of Europe. The great West and Northwest have become the granary of the world. And if we gather the food of the fields as the sands of the sea and fill our store-houses to bursting, it will not remove from us the sense of responsibility which we must recognize not alone toward the protection of our own right and national dignity, but toward the solution of the problems which have sprung up to vex and disturb the peoples of the Old World.

JUNE.

A few of the prominent events and happenings during the month of June are recorded below.

June 3, 1898.—Lieut. Hobson sinks the Merrimac.

June 4, 1859.—Tremendous frost throughout the United States.

June 5, 1752—Franklin experiments on electricity.

June 6, 1798.—Imprisonment for debt abolished.

June 7, 1776.—Resolution for Independence introduced.

June 8, 632.—Death of Mohammed.

June 9, 1870.—Death of Charles Dickens.

June 12, 1898.—United States Army sailed for Santiago, Cuba.

June 13, 1845.—Petroleum first discovered.

June 14, 1777.—Union Flag adopted by Congress.

June 15, 1667.—First transfusion of blood in man, France.

June 17, 1775.—Battle of Bunker Hill.

June 18, 1815.—Battle of Waterloo.

June 19, 1867.—Maximillian, Emperor of Mexico, shot.

June 20, 1782.—Congress adopts Great Seal of U. S.

June 22, 1897.—Queen Victoria's Diamond Jubilee.

June 23, 1891.—Rain-making experiments begin in Texas.

June 24, 1497.—John Cabot discovers North America.

June 25, 1876.—Custer's Massacre.

June 26, 1775.—First Army Hospital established.

June 27, 1849.—Gold hunters rush to California.

June 29, 1849.—Elizabeth Blackwell received first M. D. given to a woman.

June 30, 1775.—Dr. Church appointed first chief physician of the army.

THE HEN A WINNER

The Grange is a great forum for debate among the farmers, and as a rule its progress is of lively social and literary interest. It fosters the get-to-gether spirit among its members and is becoming a very strong influence with those who devote their lives to agriculture. Naturly the questions which are of vital interest to the farmer are most discussed. Recently the Rushville Grange took up the somewhat broad problem as to "Which is the most Profitable on a Farm, 100 hens a cow or 10 sheep?" After a lively and searching discussion, the hen came off victorious. She gathered the debators under her wings and made them faithful members of her brood.

It was the claim of one of the enthusiastic and experienced poultry men, as he compared the poultry business with that of dairying or sheep raising, that there was needed only a small amount of outlay in buildings and land, that the losses from death was small, that the outlay for labor was not large, and that returns came in every day of the year. His figures were regarded as conservative, except on the average price of eggs per dozen, which he placed at 30 cents. This figure his opponents contended was altogether too high, although dwellers in the cities will not dispute it in the slightest degree. He said the average

hen would produce $3.60 per year, minus a cost of $1.60 or less for keeping, leaving a net profit of $2 per hen or $200 profit from 100 hens.

A dairyman, estimating the profit from the cow and sheep figured the value of production from the former at $109, including butter, or milk, skim milk and calf, while the cost of keeping would be $60 leaving a profit of $49.

From 10 sheep, he figured the wool would bring $20, and the lambs $60, from which should be subtracted $30 for feed, leaving a profit of $50. Another sheep grower gave it as his experience with a flock of 10 sheep as having made a net profit of from $10 to $12 a sheep.

These figures are interesting even to those who do not labor in the fields. And while the hen has come off triumphant the margin of profit does not appear to be so large that city people, who do not know anything about the proposition can take it up and grow independently rich in a few years. It is absolutely true, also that those who go into the chicken business must study it carefully and give it a great amount of attention. Due consideration must be given as well to the business end of the industry, for the eggs will not market themselves, the cost of feed is higher at some times than others, and the flocks must be properly thinned out when there is a good chance to get a reasonable price for the young. Raising chickens is a business of itself the same as anything else.

RINGLET BARRED ROCKS.

Special Sale Catalogue.

Mr. E. B. Thompson, Amenia, N. Y., writes us in sending a copy of his 1915 special sale catalogue, as follows: "Be assured that I have the finest quality lot of "Ringlet" Barred Rocks to offer at this time. The inclosed catalogue will give you particulars. They are of my best breeding lines, with the same blood lines that has won so well for me at New York and the whole country over for my customers. The trios and pens are mated properly with assurance of breeding results, and I feel I am offering the public the best quality at the best prices ever offered."

We inspected this line two weeks ago and were most favorably impressed with the "Ringlets." Mr. Thompson has more and better Barred Rocks than ever before and we will make mention of our visit next month. H. P. S.

JUDGES AT THE NEW YORK STATE FAIR.

We have just received from Superintendent Wm. H. Manning, the following list of judges who will officiate at the New York State Fair to be held September 13, to 18, 1915. This large and complete list should have special interest for our readers. It assures a great and successful exhibit. Remember the dates.

W. B. Atherton, Brahmas, Dominques, Polish.

W. H. Card, Rhode Island Reds, Pit Games.

Chas. D. Cleveland, Partridge and Silver Penciled Rocks and Wyandottes.

M. L. Chapman, Campines.

J. H. Drevenstedt, Brown Leghorns, Black Minorcas, Cornish.

L. P. Graham, White Wyandottes, Buff, Black and Silver Leghorns.

James Glasgow, Games and Game Bantams.

L. D. Howell, Buff, Black Wyandottes, Houdans.

J. D. Jaquins, Langshans, Cochins, Dorkings, Javas.

Mrs. W. P. Masten, Buckeyes, Andalusians, White Minorcas, Spanish.

W. G. Minich, Waterfowl and Turkeys.

Haldie Nicholson, Barred Rocks, White Buff and Jubilee Orpingtons.

D. Lincoln Orr, Columbian Rocks and Wyandottes.

Frank L. Platt, Anconas, Faverolles, Red Caps, Lakenvelders.

H. P. Schwab, White Buff Rocks, Blue Orpingtons.

A. O. Schilling, Buttercups, Sussex Ornamental Bantams.

W. E. Samson, Golden and Silver Wyandottes.

W. J. Stanton, Pet Stock and Pigeons.

Irving Rice, White Leghorns.

E. B. Ulrich, Pigeons.

Professor Jas. E. Rice, Table Eggs.

MR. HARLO J. FISKE.

West Springfield, Mass.

Just as we go to press, we have word from Mr. Harlo J. Fiske, 891 Westfield street, West Springfield, Mass., advising us that he has bought his line of S. C. White Leghorns and in future will again devote all his time to their breeding and improvement.

Mr. Fiske lately sold all his stock to Mr. Stewart Haddock of Poughkeepsie, N. Y., and intended taking up other work but the call of the hen" was too much for him; he has bought back all his stock and will again be numbered with the progressive breeders of today.

This is most excellent news. Mr. Fiske for many years was favorably known as a leader among the S. C. W. Leghorn breeders, his work was successful and he proved his line way up in front as one of quality and practical worth. We welcome him back with a feeling that he is not only wanted but is needed and we congratulate the farm on his return and gladly commend him to our readers. H. P. S.

CHICKENS POLISH GEMS.

A chicken raiser of Arizona, recently made a unique discovery which is going to aid materially to his revenue in the future. His farm is near an old mica mine, and the soil abounds with semi precious stones of several kinds, such as the Navajo Indians use in making their jewlry. He has sold a considerable quantity of these stones for a small price to a local jeweler.

While dressing a quantity of fowls for market one morning he accidently cut into the gullet, and was surprised to note the highly polished conditions of the small stones and gravel contained in it. He decided that his chickens should thereafter polish his gems for him.

He placed a tray of glittering red stones known as false rubies, in the pen, with a dozen fowls. They swallowed them eagerly. He tagged each of them and kept them in confinement for several weeks. He then killed them for market, taking pains to open the gullet of each. He recovered several stones, all beautifully polished, so that he was able to sell them for three times as high a price as in their unpolished condition. He had made a neat sum for himself, and his fowls were none the worse for the experiment.

ALWAYS MENTION
EVERYBODYS'
When Writing Advertisers

MARTIN'S REGALS

HALF PRICE EGG SAL E.

After June 1st the price of eggs from my prize matings (as they run) will be $2.50 per 15; $4.50 per 30; $6. per 45; $12. per 100. Dorcas Pens—$3. per 15; $5.50 per 30; $8. per 45; $16. per 100. Special Matings—$5. per 15; $9. per 30; $12. per 45. Utility Matings—$3.50 per 50; $6.50 per 100.

Send one dime for the Regal White Wyandotte Book telling all about White Wyandottes.

This is an excellent chance to become acquainted with America's finest White Wyandottes at small cost. All my winning pullets and some of my winning cockerels at the Boston Show, 1913, were June hatched.

FREE—Send for Catalogue and Summer Sale List, giving description of several hundred breeders I am offering for sale.

JOHN S. MARTIN, Box D., Port Dover, Canada.

Hatching Chicks And Their Color

What is a Successful Hatch and What is the Color of Different Varieties of Baby Chicks

H. V. Tormohlen.

With the first of June the hatching season is practically at an end notwithstanding the fact that each year some of the prize winners at the leading shows are hatched in this month. Many people who have lived in hopes and expectation and have been reading and watching for each number of the poultry journal eagerly for months suddenly have their air-castle tumble about the first of June when they realize that their hopes have been thwarted for another season and they do not care if they ever see another journal. A great many of these people get discouraged too soon. Faint heart never won fair lady nor made a successful poulterer. Some of our friends even get discouraged with the arrival of the eggs they bought from some prominent breeder.

Because you have paid a good price for a setting of eggs from some breeder is no reason why you should apply the egg standard to the egg you receive and write saucy letters to the breeder because the eggs were not all of the same shade or color. If he had known this was what you wanted he would have picked out the eggs at the corner grocery. Varieties laying tinted or brown eggs may lay many different shades of eggs. Some white egg varieties often have an occasional bird laying a tinted egg. Strange to say these tinted eggs in the white varieties though, if they hatch pullets, the pullets do seldom lay tinted eggs. They occasionally crop out when there is no apparent cause for it.

Therefore do not judge the chicks by the eggs. I saw a setting of eggs from one of the most prominent if not the most prominent breeder in the east, this spring, which cost the buyer more than $1 each and among them was a very ill shaped egg. The egg hatched though and who can tell whether this very chick may not be the very best in the whole lot.

The point I am making is that it only takes one egg to hatch the coveted first prize winner and it is all a matter of chance what color or shaped egg this chick will be hatched from. Leading breeders therefore do not like to take chances in eating a slightly ill shaped egg for they may be eating the golden egg.

Others get disappointed when after paying a fancy price for a setting of eggs to find that they get only a half dozen or say two or three chicks from the whole lot. Then they commence to figure that the chick or two cost them $5 or $10 or $15 each, as the case may be. But do not complain if you got one chick as far as blaming the breeder who shipped you the eggs is concerned. Take pains and raise the one chick. It may be worth a whole flock. Nearly every breeder has a fertility guarantee and when eggs do not prove fertile take advantage of the guarantee. Many breeders also guarantee a certain number to hatch or replace at half price or some such arrangement. Therefore if at first you do not succeed try, try again. Do not grow suspicious of the breeder until you have given him a fair chance to live up to his guarantee.

Then again many keep their hopes and expectations at a high pitch until the eggs really hatch and then let them fall to earth because the chicks do not happen to be a certain shade or color. Remember again that it is just as hard to judge the mature fowl by the chicks as it is to judge it by the egg.

All black fowls may be said to be black but all chicks hatched from eggs from black fowls are not black nor are they alike. The same may be said of white fowls. Not only does the variety have a great deal to do with the color of the chick when hatched but different strains of the same variety often shows a difference so pronounced that the experienced eye can note the difference.

Dispell then your fear for the next few weeks and withhold your judgement, if you have a bunch of chicks on hand from eggs you purchased. Because they do not look like the chicks from your own fowls of the same variety is no sign they will not turn out even better than your stock.

Most people are sufficiently informed about chicks to know that Barred Rock chicks are not hatched with bars and yet I have known of customers to call the breeder all kinds of names, intimating that he was crooked, because the chicks did not hatch with bars. This spring I heard of a case where a party paid $5 for a setting of eggs and then after he received them refused to set them and wired to the breeder at his expense asking for a return of his money because the eggs did not suit him in shape. When the breeder wired back the charges were reversed on him costing him 91 cents more and yet the buyer refused to set the eggs.

JUST AS THE CAMERA CAUGHT HIM.

First Prize Cockerel, Brockton, 1918. Also Winner of Color Special.

Mr. William A. Hendrickson, Wilton, Mass., is one of our prominent Light Brahma Breeders who for years has been breeding Quality Brahmas and has been active in club work. Above is shown one of Mr. Hendrickson's winners, natural as life. At their shows this past season; viz, Boston, M. S. Garden, New York and Brockton, Mass., Mr. Hendrickson won well. At the club show at M. S. Garden, New York, he won silver cup for best display, first pen, first cock, first hen, fourth cockerel, specials for best male, special for best female, etc. H. P. S.

Hendrickson's Light Brahmas.

Blue Ribbon Winners at the three leading shows 1915; M. S. Garden, New York, Boston and Brockton. At the Club Show M. S. Garden, New York in the largest quality class ever shown, I won first prize pen, first cock, first hen, fourth cockerel. Special for best female, etc. At Boston won the $100 Cup for Best Light Brahma Females, Etc. At Brockton, Gold Special for Display, Etc. Write me your wants. Addreess,

WILLIAM A. HENDRICKSON, Mattapan Station, Houston Ave. **MILTON, MASS.**

These are cases were "ignorance is bliss and to be wise is folly" is certainly not true.

The parti-colored or black red varieties of fowls which include the partridge varieties, Brown Leghorns and Cornish chicks are very beautiful when hatched. There is a band or stripe of brown from the head to the tail and with lighter and narrower stripes on either side on the back. Over the rest of the body they are light brown or dawn. Brown Leghorns which are double mated can usually be told at hatching in that the light or female line chicks are very much lighter than the dark or exhibition male chicks. The male line are often so dark that the stripes blend on the back.

A black chick should not be hatched entirely black, if it is to be a green metalic black when grown. Some white shows good breeding. White about the head and breast in black chicks are the most satisfactory markings.

White fowls with yellow shanks should produce various degrees of creaminess or faint lemon yellow. A blue grey tinge to the fluff in white chicks will produce a white quilled chick invariably. But if a white chick from a white-plumaged and legged fowl has bluish shanks that thing, never clears. In fact blue shanks on chicks, no matter of what variety of yellow or white legged fowls, never clear.

The chicks from buff fowls come either with a yellow or buff cast, and have reddish-yellow legs, which gradually turn to white. The red is the blood showing through the skin while after the scales on the leg form they do not permit the red blood to show through.

Red varieties are very near like the buff, but they generally have shown more white and have a patch of brown on the back.

Black chicks always grow some white feathers in flights of wings. Parti-colored varieties often do. This should not alarm you in the least Parti-colored varieties should not necessarily grow white feathers at first, but it all depends upon the strain and care of the chicks. Chicks hatched in incubators and raised in brooders generally grow white feathers at first and time and again I have seen chicks hatched from the same eggs and at the same time under hens and cared for in the natural way never develop the white in wings. Then again chicks confined while growing will often develop white no matter how they are fed or cared for.

The white chick developing and getting a black feather or two hear and there will quite likely be your whitest adult so do not berate the breeder for selling you mongrel eggs.

Again chicks are often condemned because the legs are not yellow and should be. Do not get excited. The chicks that has yellow legs at hatching time will fade while the chick with darker legs, but with good yellow under foot, will produce the best yellow shanks.

To gain an advantage in mating up your pens for better results watch your chicks develop very carefully and you will soon find certain marks are marks of future quality, while others are sure signs of being a cull. Experienced breeders can commence culling just as soon as the chicks are old enough for friers, but the beginner should not take this risk until he is thoroughly familiar with the life history of the chicks of his variety else he may chop the head off his best bird unknowingly.

Breeding Columbian Plymouth Rocks

Their Mating and Breeding, Color Qualifications, Surface Color Favored.

By Mr. T. J. Enslin

Much has been said in our American Columbian Plymouth Rock Club books, bulletins, and Poultry Journals, regarding the standing of Columbian Rocks from a utility point of view, but little has appeared on the subject of breeding these wonderful birds; hence, my desire to give my experience in breeding them.

In mating up, the same principles apply as to Light Brahmas and Columbian Wyandottes as far as color is concerned. The color markings for the three breeds, according to 1914 standard of perfection, do not exactly conform to each other, but I am glad to say the American Poultry Association at last year's meeting in Chicago passed resolutions which makes them conform to each other in every detail in the 1915 standard.

Another most essential resolution was passed at the A. P. A. meeting, viz., "White" under-color has been dropped entirely and "Bluish Slate" under-color substituted for all parts of the body except breast under-color, which will be "Bluish White". The question of under-color is one of the most important factors in breeding Columbian Rocks, as good under-color. My experience has been that white under-color birds seldom produce strong colored birds. The male bird should always have well defined color markings as his color is the preponderating influence on color of offspring. I wish, however, to emphasize at this time that it is a serious mistake to mate up a male bird (especially cock bird) having very dark surface color in fluff and breast either some distance below or immediately adjoining front of hackle. The result will invariably be dark, smutty colored offspring. My principles have always been to, "Breed as you exhibit as you breed", and I am glad to say this is particularly true with Columbian Rocks,—no double mating being necessary.

My best results have been with birds that come near being the ideal. Birds with white under-color (which are generally weak in black) as a rule breed too light and the so called dark bird generally breeds too dark, that is, if either one or the other is pronounced; it sometimes happens that a strong colored bird mated to a weak colored bird produces some good specimens, but my experience has been that you cannot get uniformity in the offspring from a mating of this kind. Technically speaking, you must not have too wide a breach between good points in male and same respective points in female, or vice versa, in order to produce uniformity. This is very essential as uniformity in offspring generally with it a large percentage of exhibition birds. You generally see many culls where this method is not carried out.

I find by mating dark male birds to ideal females that a good proportion of female offspring will run fine in color, but 90 per cent. of the male offspring will run dark. Much better results will be obtained by using a comparatively light male with good under-color, and by line breeding one generation, on female end, still better results will be obtained. Care should be taken that male bird has at least some black striping in saddle feathers as this particular feature seems to regulate the amount of "Brass" in male bird, which has been one of the hardest points to overcome. At this instance, I take the opportunity to congratulate the members of the A. P. A. revision committee when at Chicago last summer they settled once

OWEN FARMS, 163 Williams St., Vineyard Haven, Mass. Maurice F. Delano, Prop. Frank H. Davey, Supt.

for all the question of having color markings for Columbian Rocks, Columbian Wyandottes, and Light Brahmas conform to each other. This will give us in the 1915 Standard a color marking for Columbian Rocks such as had never been published before and will represent the ideal bird.

Striped saddle feathers generally bring with them strong hackle, tail, and wing. I trust, however, this change will not influence breeders to produce a smutty colored bird (so to speak) for nothing will cause them to lose their beauty (and naturally, popularity) quicker than that.

In color points, discrimination should be used and the surface favored over under-color and hidden points. Too much attention cannot be paid to hackle, saddles, and tail coverts having preference over primaries and secondaries, because hackles, saddles, and tail coverts are on the surface and enhance it, whereas wing points do not affect the surface at observation. Good wings alone will not control hackles, saddles and tail coverts in breeding. Invariably, dark slate under-color is accompanied by out croppings of black in surface in both sexes which destroys the beautiful appearance of the bird. Dark slate under-color in hackle almost always produces a smutty hackle which generally accompanies black markings in surface color in back. It is much better to have base of hackle feather (near skin) a bluish slate color for about one third or enough to allow each black stripe to completely lap the other.

On the question of type, I have always found that the female has preponderating influence on the offspring. It is therefore necessary to select females with long bodies, broad backs, deep chests and necks, legs, and tails, to conform.

I contend that Light Brahmas markings show up to better advantage in the Rock type than type of any other breed and naturally feel, in view of what Columbian Rock breeders have already accomplished, that our breed will not very far hence be the most popular fowl in the Plymouth Rock family.

It was not my intention to say anything regarding our breed as a utility fowl, but I cannot refrain from doing so, as I am at this writing in receipt of a report from the North American Egg Laying Contest which states that a Columbian Plymouth Rock hen has this year broken the world's record of 282 eggs, by laying 286 eggs in one year. Results always speak for themselves.

Worldly Wisdom.

True friends seldom come in bunches.
Mere talk is cheap, but some advice is expensive.
Every time a woman gets married some man's troubles begin.
You can't always judge a man's worth by the taxes he pays.
Nothing pleases a woman more than to be misunderstood by a man.
An ideal may be all right, but a square deal is usually better.
It might help some to levy a war tax on the aspirants for office.
But the male of the species is never too hoarse to sing his own praise.
Time is money when you are asked to pay $1.50 for repairing a 98 cent watch.

TO LATE TO CLASSIFY.

WHITE MINORCAS, BOTH COMBS. CHOICE breeders for sale. Mrs. Osborne, Fabius, N. Y.

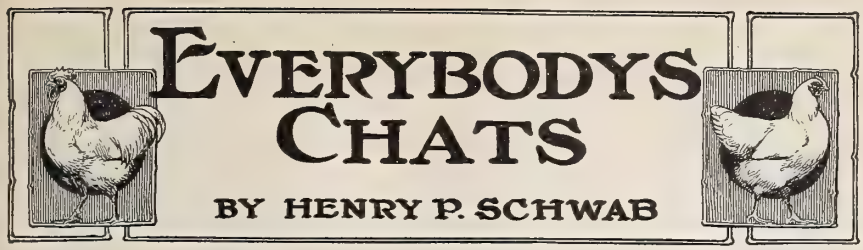
Foxhurst Farm Black Orpingtons

Are World's Champions

Our New Catalogue tells WHY also WHY they are the greatest UTILITY Strain in existence. Will sell from June to September, our choicest birds at positively half price. Shipped Express paid on approval. Satisfaction guaranteed.

FOXHURST FARM, - Lime Rock, Ct., U. S. A.



Hatch your winners in June.

And what is so rare as a day
in June?
Then, if ever, come perfect days;
Then heaven tries the earth if it be
in tune.
And over it softly her warm ear
lays.

June hatched birds have a superior color, this is a fact and not a secret. Try it and see.

Are you giving the chicks the care they should have? Every little bit of care helps to make them better.

And with this don't overlook your grown fowls; eggs may be cheap now, but the day of high prices is coming again soon, and then you will want the best amount possible. Insure receiving this with proper care and food now.

"Let us see as we have seen—
Where all paths are dewy-green,
And all human kind are kin—
Let us be as we have been!"

This seasons crop of poultry is not the largest ever produced, still it ranks well with the others and is no doubt one of the best.

More care has been taken in selecting and in breeding, facts that will show up well and strong in the results and in the future. Quality combined with worth is sure to tell the story of progress.

Easy going men often go the wrong way.

One get-out-and-hustle man is better than a dozen of the sit-and-wait-for-it-to-turn-up brand.

The A. P. A. election is over and the country is again saved.

The result of the election should be a pleasure to all members. Mr. E. E. Richards will make an ideal president. Mr. Peters is a tried and not found wanting vice-president and secretary Campbell surely is the right man in the right place.

The meeting will be held in November in connection with the Poultry Show at San Francisco, California. That this will be a feature meeting goes without saying. Let's all make an effort to go.

The only cloud apparent as the result of the election is the defeat of Mr. Jos. Russell. We well know that he did not seek office, that he really did not want it. We also know him to be capable and a thorough fancier and breeder, the same must be said of Mr. Peters, the regret is that two such able men should oppose each other.

Lady—"What caused you to become a tramp?

Ragged Tim.—"My family physician, mum. He advised me to take long walks after meals, an I've been walking after 'em ever since."

When in New York a week ago I met Mr. Charles D. Cleveland who assured me that no change had been made in the New York dates and that none had been proposed. The dates are December 31 to January 6, next.

Put these dates down where you wont forget them. The Madison Square show is the one you don't want to miss.

Circulation interests us now more then ever before, it is particularly pleasing to receive the subscriptions that are being sent in such large numbers by our readers and friends. "Everybodys" seems to have struck that cord of mutual affiliation and personal interest, that we wish ever to retain and to improve.

In the gloaming when all is stilled
And ne'er a sound you miss;
The smack may be a skeeter killed
Or just a sweetsome kiss.

Elsewhere we give the complete list of judges for the New York State Fair to be held at Syracuse, N. Y., September 13, to 18, 1915. The list is an unusually large and complete one, one that will strongly commend itself to the breeders of the country. Look this up and be sure to exhibit and to visit this great fair.

In the list of judges we note the name of Mr. Frank L. Platt, Swanton, Ohio, who will judge the Anconas, Favorelles, etc. This is royal good news for we are very glad to see Mr. Platt in a position where he can again accept judging engagements.

Young's Strain S. C. W. LEGHORNS

I Have No Other Breeds

Acknowledged throughout the World as being the standard for all the Leghorns and the leading strain of heavy layers. They have been bred in line since 1853, for heavy egg production alone, and the show birds have simply been chosen from the layers. They are the only original line bred strain of Leghorns in America today.

Why not come to headquarters and get the best?

Hundreds of yearling hens and cock birds for sale. Eggs at half price remainder of season. Mating list free. Address

D. W. YOUNG, - MONROE, N. Y.

Sunnybrook Farm's Wyandottes and Leghorns

We have the largest and best lot of chicks that the farm has yet turned out. Exceptional bargains in breeders including 500 choice Leghorn hens and one-half of our White and Columbian Wyandotte breeding females.

We shall be in a position to supply SHOW BIRDS for the very EARLIEST SHOWS.

Charles D. Cleveland

Box 50 - Eatontown, - New Jersey

Have you noted our Prize Subscription Contest? Better enter in this; there are prizes for all (we are reserving one for you) with the opportunity of winning one of the Grand Feature Prizes. Consider this well and get busy today. Here is something worth while.

Jones—"Will you raise your own vegetables next year?

Suburbs—"No. Just praise the neighobrs' truck and they'll give you the best they raise as a brag!

The splendid catalogues issued by several of the poultrymen are a credit to the entire industry. They are business makers and getters, and we hope to see more of them.

The Wilburtha Farms catalogue is a rare beauty, the result of most careful thought, as well as a work of art. Breeders interested in S. C. White and Buff Leghorns and Columbian Wyandottes should ask for one. Address the Farms at Trenton Junction, N. J.

In this we also would mention the catalogue of Mr. Frank McGrann, Lancaster, Pa., whose specialty is the Black Minorcas. Mr. McGrann, like his stock is favorably known as a judge and breeder. His catalogue is also one of rare beauty and merit that should be in the hands of every breeder of this variety.

"Pa, why does a woman give up her job in an office as soon as she gets a husband?"

She can't very well be boss in both places, can she?"

Farmer—Hey, there! Those ain't wild ducks—those are tame ducks.

Sportsman—That's all right—my wife won't know the difference.

This seasons crop of poultry promises to be one of greatest value in quality as well as in quantity, fertility has proven to be generally good. The breeders we have seen so far have an extra fine lot of youngsters coming along. Things look good in "Chickenville."

The report comes from a Maine farmer that one of his hens has hatched 18 chickens from 13 eggs. And yet Maine is a prohibition state.

"What's that piece of cord tied around your finger for?"

"My wife put it there to remind me to post a letter."

"And did you post it?"

"No; she forgot to give it to me."

Don't forget the caution we have given about the feeding and growing of your chicks; look well to this. Market your surplus early cockerels will also give your good birds more room and save feed bills that must be considered.

General Harcomb, commander of the east was found off duty and will be court-marshalled on June 1. Commander Thompson will hold this investigation at his quarters on Storm-King and Colonel Punderford from the department of New Jersey will prosecute the case. Good-night General.

The new dress of the Poultry World is very nifty and becoming; we will now welcome the World more than ever before. Our readers can get the World and Everybodys, both for one year at 75 cents; better send us your subscription now.

Grateful Patient—"Doctor, how can I ever repay you for your kindness to me?"

Doctor—"Doesn't matter, old man. Check, money order, or cash."

Dauber—I observe that you don't like my pictures, sir; but I can only paint things as I see them.

Critic—Then you shouldn't paint when you're seeing things like that.

Link Orr may be an Irishman, beside a jolly good fellow. We always accused him of being an American. Nationality counts for little when we consider men. Give us more men like Link.

Patience is the long road that leads to success.

If you please, it is now president-elect Richards, and not Dick as formally, still we have the habit and after writing the above, consider we have done our duty, and forever after it will be just the same old Dick with us. He never had any frills to sheer off.

We note a Canadian paper publishes: "Hints For Those Who Wish to Secure Really Fresh Eggs From Their Own Hens." We wouldn't feed a hen that laid any but fresh eggs.

We love but seldom that which is not fair
As well as good; and so our taste to suit,
Dame nature always puts a blossom there,
Before she does the fruit.

The F-L-E-A'S individually and as an organization have had a big boost lately. This popular organization is bound to be a factor and more of interest will soon be published.

The Americen Poultry Journal's Year Book is at hand and is the best edition published to date; it is very complete in down to-date information, well illustrated and a book worth many times its price.

From the Hickeyville Clarion:—"Grandpa Bibbins is laid up with the skyattic rheumatiz at this writing, and is unable to attend to his regular duties, which is chawing tobacker back of the stove in Tibbitt's store.

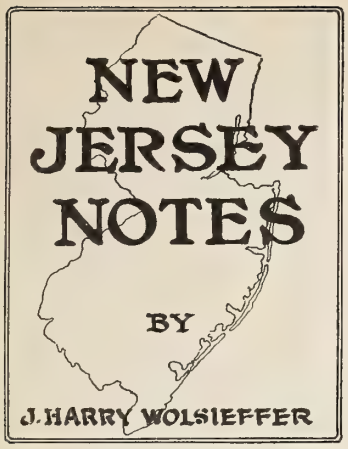
OLD FORGE POULTRY FARM
Spring Grove, Pa.



Size considered the "Skeeter State" is the greatest poultry state in the union, with fifty poultry associations before 1915 closes, and some twenty-five poultry shows, the Jersey poultry man has much to be proud of.

At Brown Mill is the largest poultry plant in the world, with a capacity of 20,000 laying hens, single comb, White Leghorns and White Plymouth Rocks are kept. At Vineland the largest pigeon plant in the world is staged. The buildings are of concrete, the alleyways cover 8,217 lineal feet, the largest building is 2,000 feet in length (the world's longest building.) White Kings are the pigeons kept, developed and improved by the Giroux Brothers, owners of this wonderful plant.

New Jersey will be put on the map of publicity when the Vineland International Egg Laying Contest starts in 1916. The ground will be prepared this year, shade, natural. will be provided and the fowls will have the run of alfalfa. It is expected that the leading breeders will enter, especially a contest with such features as the Vineland contest will have.

With good fertility and a spring with good growing weather, the up-to-date poultry keeper is wearing a smile that won't come off. Especially is this true of those who hatched in March and April. These early birds are profit payers.

Live men have been selected in every county and if the poultry raiser is not well served by those now on the executive committee, they never will be. The New Jersey State Poultry Association, will each year, be in a position to do much for the poultry keepers in the state. Each and every poultry association should do everything in its power to make the State association stronger each and every year.

Much interest will be centered on the State Show this year, the place to be decided by a vote of the executive committee of the New Jersey State Poultry Association in June. Associations with proper room for a first class exhibit will be considered in the selection by the committee regardless of what section of the state the association is located, although, the state show will be held in different sections of the state, from year to year, after the first show is decided upon.

The Vineland International Egg Laying Contest under the direct management of the New Jersey State Experiment Station, to be staged at Vineland, New Jersey, next year, should be popular with the leading breeders of the country, with up-to-date management. Under State control, ideal climate and soil and new up-to-date features that will prove their worth, from a practical standpoint, the contest should prove of great value to all interested in poultry.

The word utility is being abused. It surely means more than is seen in many flocks under that label which have not produced enough to be placed in that class, much less look like the breed they are supposed to represent. Too many culls are being sent out to the beginners in this country that do not have the shape that the breed represents, nor do they have the real producing powers that the word utility should stand for.

New Jersey Poultry interests have been sadly neglected as far as representation at the Panama-Pacific Exposition" is concerned. This is through no fault of the poultry keepers of the state, but through the short-sighted policy of the law makers who considered the poultry industry of little importance, yet New Jersey has within her borders the largest poultry farm in the world, the biggest pigeon plant, and no state, size considered, has as large a poultry interest as the "Sketter State." Someday the law makers will wake up and give the industry the support it deserves.

The Advance of the Blue Orpington

Breed to Shape, Blue Orpington Color Compared Under Color, a Review of Breed Requirements. By Mr. Haldie Nicholson.

The Blue Orpington being a new breed its future lies in the hands of the breeder, and the success or failure lies in the fore-sight of those who will make a determined stand and to always remember type. "Type" should be their watch-word.

Our present Standard color is as follows: Male-neck, saddle, wing-bows, back and tail, dark slaty blue. Remainder of plumage, a rich, medium slaty blue. Each feather to show a distinct lacing of dark blue. Female-head: neck, dark slaty blue. Remainder of plumage a rich, medium slaty blue. Each feather to show a distinct lacing of dark blue.

Three years ago when I went in for the Blue Orpingtons my first thought was type, and type in an Orpington to my idea is the beauty of the bird, and I have worked on these lines more than anything else. The Blues which have been exhibited during the past year have shown their improvement in type. Take our club at Boston. It was acknowledged to be the best type of Orpingtons that has been exhibited for some time.

Now, if we had started off and had been "faddyists" and had our eyes "glued" on one particular shade of blue we would not have the type that we have today, and, in fact, would not have had the color and lacing we are now producing. I want to say, to both breeders and judges, and that is, to always remember that there is no two breeders who ever mate up in the same way, and although they try to produce an ideal color, conditions which they have no control over will bring the shade of color a little different in each breeder's yard. To illustrate this more fully, take from four settings of eggs and give to four different parties, and you will find that although all the eggs have come from the same mating, there will be a little difference in shade of color owing to difference in soil and in the different ways of feeding. This is why I say that type should always be considered first.

I can see in my darker Blue Orpingtons the beautiful dark lacing of the females and the grand dark, breast lacing of the male, with his dark, glossy top color. This I can see and appreciate. Then we have the light blue and when you catch the female just when she is in full plumage and ripe to show with her clean, blue lacing, it is hard not to be fascinated with her particular plumage. Then comes the male with his dark, blue top color that always makes a big impression on you. Now, as I have said above, I can see grand quality in both shades of color, and I shall always in either judging or mating Blue Orpingtons, let type decide the question, for, as above, conditions change color, and another thing we do not all mate up alike. To illustrate this, I will give you the shade of color of my winning males and females during the past season. To start with, the first Boston cock, about medium in color. First N. Y. cock, a very dark specimen. First Boston cockerel, a very blue-tinged bird, but of a darker order. Not so dark on top as the first Boston cock. Second Boston cockerel, a lighter blue, having a blue top color. First Chicago cock, fairly dark. First Springfield cockerel, about the same shade of color as the second Boston cockerel. First Palace cock, very dark and glossy top. Dark Blue breast. Third Boston cockerel, about as nice a shade of blue as any bird I have produced this year. First New York Palace hen, a clean, dark blue, heavily laced. First Boston pullet, about a medium color but very clean blue. The winnings of other breeders at the same show are as follows: First Springfield hen, about a medium, soft blue, but very clean blue. First Springfield pullet,, a nice blue ground-color very dark lacing. First New York pullet, a very even color; about medium. Now all the above birds are of a slightly different shade of color, no two birds being just exactly the same color. Mr. Oke was judge at both Boston, New York and also Springfield, and you can see by the above judging that he is no "faddyist," but judges a bird absolutely on its merits. The Palace Show, N. Y., the Blue Orpingtons were judged by Mr. Card, and his ideas follow about in the same groove as Mr. Oke's.

To make this article blend in judges, color and type I would like to say a few things in regard to Mr. Card. In my estimation I think Mr. Card has the best ideas in regard to color of any judge in America. His ideas in regard to color and judging are, I think, identical to this article. If you have ever read any of Mr. Card's articles on the shows he has judged, you will find that he is no "faddyist" and he has no particular choice of color, and this pertains especially to Rhode Island Reds, that is, the dark shade of color will win, if he is the best bird, or the medium color will win if it is the best bird, as the case may be, showing that Mr. Card's and Mr. Oke's ideas are about the same, both

judging birds absolutely on their merits.

In Regard to Under Color of The Blue Orpingtons.

I explained to my co-workers in making our present Standard to leave under-color out of our present standard. I wanted to see how we could produce birds without this under-color question hung around our necks, and I told them that this was the proper time to talk the matter over and decide. I have never heard one complaint or one question in regard to the under-color of Blue Orpingtons. I had the above in mind when helping to make the present Standard. I thought if we did not have the word, under-color, dark slaty, or light slaty, we should not be liable when showing our Blue Orpingtons to have this oft reply of judges: "The bird wins on his splendid under-color. Or "the bird didn't win because he failed in under-color." I told my co-workers also that if we omitted this under-color question and keep it out of our Standard that we would save a lot of trouble and disappointment in the show room.

I believe that we should always keep out of our Standard the word, "under-color." We have varieties such as Barred Rocks, which have a Standard which demands under-color, and this should be lived up to, not only to the letter but the principle of the thing. With our present Standard of the Blue Orpingtons one may be able to see the winner in his coop with all of his fine points fully in view, or what defects the losers have one may be able to see them just as well as the winner's good points.

The Blue Orpington today stands out as one of the most wonderful breeds. Remember, we in America, have only been breeding them for about three years. Individual specimens have been shown that have equaled the Black Orpington in type. It shows that the progress of the Blues has been wonderful. The best specimens in the Blues are not short in legs or short in back. They seem to have a length of leg in proportion to the size of body or in other words, type is not over-done. The prospects for the Blues in the future are very good. In fact, Canada is becoming a great center for the Blues, and are taking up the breeding of Blues largely.

I will now come back again to the shades of color in the judging of the Blue Orpingtons. The best bird that I have had in my yards or have ever owned is the first Boston cock of 1915. No doubt, he stands as one of the best specimens of the Orpington variety ever produced. To illustrate this as plainly as I possibly can to you; the first Palace cock has a better blue color in my estimation than the first Boston bird. But to judge the two birds on their merits, the one not having the best color which is the first Boston bird, is absolutely worth 100 of the first Palace cock. Now, if we had a color "faddyist" judging these, he would be liable to be carried away by the color of the first Palace cock. To give you still another illustration, the third Boston cockerel is, no doubt, the best and brightest blue colored cockerel that I produced this year, and was far superior in color to the first and second Boston cockerels. Still the first and second Boston cockerels had him beaten on their merits. Again here was the same chance for the "color faddyist" to make a mistake. This is why I am trying to impress on breeders and judges that all birds should be judged section by section, not only in color but in type.

I have received a great many letters from the different articles that I have written of late both on Barred Rocks and Blue Orpingtons, and comments whatsoever and would be willing to explain through this paper, anything which they may wish to ask in regard to my ideas of judging, mating or breeding.

Barred Plymouth Rocks

Winners at Pittsburg Club Show 1915. Buffalo, Rochester, Etc. Select Breeders For Sale. Eggs at Half Price. Write your wants.

L. Ressequie, Millers, N. Y.

Caught 51 Rats One Week

Special June Prices

On Day Old Chicks

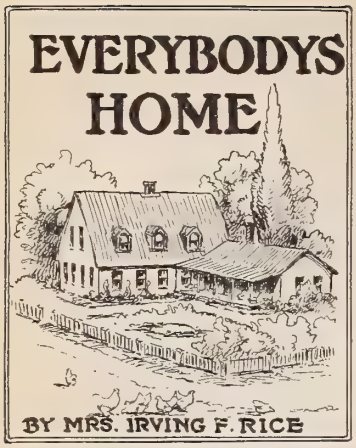
Over 30,000 Every Week

Let us know your wants at once and we will be sure to please you. All pure bred, finest quality chicks at the very lowest prices for June and July.

Fine Catalog and Large Colored Picture Free.

M. Uhl & Co.,

New Washington, Ohio



SEASONABLE SUGGESTIONS

Unlike other spring crops, the chicks grow and thrived during the three unusually dry and warm weeks of April. There is nothing equal to this sort of weather to give chickens the right kind of a start, and we are hoping that they have reserved enough benefit from it to last them through this cold damp May and judging from appearances they seem to have done so. They certainly have grown splendidly; those from the first hatch are crowing and nearly all have taken to the perches. These perches are arranged in the colony houses so that the height from the floor can be regulated, and are placed in before they are expected to sleep upon them. They will fly upon them during the day and become accustomed to them before they form the idea of roosting. At first they are about six inches from the floor so that they are easily accessable, finally a few will stay up all night and very soon all will be roosting. Then the perches are raised another notch, and finally when they have formed the habit of roosting we feel that the labor connected with their care is half releived. The hovers are taken from the houses as soon as they are not longer used, thus giving more floor space and making the house easier cleaned. This is the month to dispose of the surplus cockerels from the early hatched ones. The price is higher for broilers now than later, and ther are two other items which are of importance in their disposal first the grain saved, which at the present price must be considered and last but by no means least the benefit derived by the pullets, which will grow and do much better without their unwelcome attentions, and as the chicks grow they require more room which will be furnished by seperating the cockerels from the flocks, Of course those showing promise should be retained but it is not too early to be able to select the freaks or ordinary culls, and it should be remembered that the price paid now and the grain saved, will more than make up for the extra weight to be gained by keeping them until they are older. The best market for broilers call for them when they weigh one and one half pounds each, and it does not require such a very large chick to do this, especially is this true of the Leghorns. They are small frames, but are plump when very small and will grow to the broiler age much more quickly then will many of the larger breeds which must build their frames before covering them with much surplus meat. We have taken from the incubators this season exactly 1,908 good, strong chicks and the mortality has been very light, with the exception of some accidents and those taken by crows there have been very few chicks that have died. There has been positively no sickness at all, and right here, perhaps, I should "knock on wood," as the children say, but it is afact, never the less, that we have never had stronger chicks and chicks that have grown better than those of 1915. To be sure there is plenty of time yet for something to happen, but we always feel that the danger is mostly passed after they are through requiring artificial heat. The crows started in to prove very annoying, but have stopped their depredations for a while at least. When a crow does annoy he is a much greater pest than a hawk, owing to his superior intelligence and wisdom, which requires us to use more force and more convincing arguments to convince him that his attentions are not desired. One Sunday recently a party of seven of these dark plumaged birds decended in a body upon our field of chicks, and after helping themeselves to the best, they flew a short distance and deliberately tore the crops out and ate the grain contained in them. They evidently thought they had found the "land of plenty" and prepared to clean out the chicken business in this locality. They are so world wise that common scare crows do not scare them, and it is not feasible to poison them as it might poison the chicks as well, so we have found that the best way to rid ourselves of them is to lie in wait and shoot one or more of them which are then suspended from a long pole as a warning an dthe warning is usually heeded. It is certainly discouraging to have chicks taken this way after they are nicely started and the result seems to justify the the means in this instance. An inquiry from one of the subscribers of "Everybodys" recently asked for advice relatively to bowel trouble in a flock of chicks, caused by over heating the brooders. This is one of the worst forms of bowel troubles to successfully cope with, and the results are exactly the same as those caused by chilling, or too little heat. We have however used Bi-cloride of mercury with good results. Bi-cloride of mercury can be procured from the druggist and comes in the form of tablets. There is a formula printed upon the back of the bottle, and the one we have used is the 100th solution. This is placed in the drinking fountains and given to them in the morning, when they are first liberated. Bowel trouble causes a fever which naturally creates a thirst so it is not difficult to give them the remedy as they will hasten to the fountain for water as soon as possible; there is no danger of their drinking too much of it and a marked change for the better will soon be seen. However "an ounce of prevention is worth more than a pound of cure," so it behooves us to be careful. We must not give our whole attention to the chicks however fascinating they may be, the hens have certainly some claim to attention, and it is to our benefit to give them all that they require. They are literally shelling the eggs and although the price is low compared to that of the fall and winter, the expense of producing them is also less under the same comparison, and about as large, and will go a long way toward paying for the growing expense of the chicks.

They are kept yarded but have large yards well supplied with sheds, in which they seem to be quite content. There is not a green thing growing in the yards with the ex-

Now is the Time to Buy Rancocas Prize Birds

In the Rancocas breeding yards are over 100 birds now for sale that have won prizes at such shows as New York State Fair, Philadelphia, Madison Square Garden, Boston, Grand Central Palace, St. Louis, Williamsport, Brockton and New Jersey State Fair.

For the second time in the history of the "Million Egg Farm" we will have a Summer Sale and offer some of our record birds at unusually low prices. Many of these birds could not have been bought earlier in the season at any price, and in proof of their breeding qualities we now have hundreds of early chicks bred from these birds that are coming on splendidly.

In this sale will be S. C. White Leghorns and White Rocks that have won National fame, including the following Leghorns: "Bill Taft," 1st Cock at New York State Fair, 1914; "Victorine" 1st Hen at Boston, 1914; "Impatience," head of 1st Pen, New York State Fair, 1914; "Early Bird," 1st Cockerel, N. Y. State Fair, 1914.

This will be an unusual opportunity for you to secure Rancocas prize winning birds and choice breeders.

Write for our "Summer Sale" catalog.

RANCOCAS POULTRY FARMS
Box 641, Browns Mills, N. J.

ception of the leaves upon the trees and berry bushes bu. this defiency is overcome by the aid of the lawn clippings and clover cut finely in a cutting machine. There are plenty of "dust caves as I call them," and they really are more like caves than anything else, having been dug out until the hen can go nearly out of sight in them. During the heat of the day they will lie in these holes and seem to be taking great comfort, they are fed only twice a day with the exception of the hoppers which are always kept full of dry mash. These are opened at noon at which time the pails are rinced and filled with fresh cool water. By good care and food they can be induced to postpone the time of moulting which will add dollars to the right side of the ledger and is one of the important points which go to make up successful poultry keeping.

Helpful Hints.

To clean window glass from oil and paint stains wet a woolen cloth with ammonia and apply to the spots, rubbing briskly.

To prevent cakes, pies and other pastry from burning on the bottom sprinkle the bottom of the oven with fine dry table salt and your cakes etc., will bake perfectly.

To clean the radiators perfectly is a difficult task as all house wives with experience will testify. Try using the automobile pump and you will be delighted to see how easily and cleanly they are freed from the accumulations of dirt and dust. The same appliance is equally good for cleaning the bed springs.

There is nothing better than rice water to take out rust stains. Rub the boiled rice into the stains if they are bad and then soak in the water in which the rice was boiled.

Spirits of camphor will remove peach stains.

Ether will remove stains from woolen goods without leaving a ring.

Rhubarb Merringue Pie.

Line a deep pie tin with pastry using the following for the filling: The yolks of two eggs, one cup of sugar and two tablespoonful of flour mixed with a little milk as for gravy thickening; beat all together and pour over one cupful of finely cut rhubarb. bake in crust and when the rhubarb is cooked remove from oven and with the whites of the eggs make a merringue and cover the top. Set in the oven to brown slightly.

Rhubarb and strawberries blend splendidly in flavor and make a delicious pie and sauce. Raisins also make an agreeable change in the flavor when mixed with rhubarb.

Strawberries are such a delicious fruit that their successful preservation always offers difficulties. They consist of more than ninety per cent of water; their covering is very thin and easily broken. From their position near the ground they are literally covered with bacteria, which enter quickly in to any break in the skin and so quickly cause decay; so in order to preserve the delicate flavor the fruit must be gathered and preserved when very firm and slightly under ripe. It is unnecessary to say that such a delicate fruit as the strawberry cannot retain its natural shape and color if boiled. To do this they may be preserved without the use of any heat whatever. This is known as the syrup method, and this method not only insures the preservation of the fruit in all its natural delicacy, but also makes the labor of canning much less.

Canned Strawberries by The Syrup Method.

Select firm, slightly under-ripe strawberries, rejecting absolutely all soft or over ripe fruit; wash gently taking care that berries do not remain in water longer than absolutely necessary, as this has a tendency to soften fruit, drop them carefuly into jars that have been sterilized by boiling for twenty minutes, fill the jars as full as possible, gently shaking so as to cause sufficient settling. Put a new rubber on the jar, stand it on a clean plate to catch the over flow. Now fill the jar to over flowing with a heavy boiling syrup and water, seal the jar at once without first wiping off the overflowing syrup.

Strawberry Marmalade.

Marmalade afford the best way of using up small and over ripe strawberries that are free from decay.

Stem and wash the berries and place them in the preserving kettle, crush and add three-fourths as much sugar as you have fruit; boil the mixture over a slow fire for twenty minutes, stirring often to prevent scorching. Seal in jars.

Sweet Pickled Strawberries.

Prepare two quarts of berries as for canning; add two cupfuls of sugar and slowly heat the mixture to the boiling point.

Add half a pint of vinegar and continue boiling for ten minutes. Then keep the berries over a slow fire and below the boiling point for one hour; place the berries in a jar and boil the syrup until it thickens. Put new rubbers on cans, then fill the jar to overflowing with the boiling syrup and seal at once.

The Wonderful Egg

By Michael K. Boyer

Within the limits of an egg shell are found every element necessary to the support of man. The nature of the food eaten by the hen creates the flavor, the color of the shell having no bearing whatever in the matter.

Over $2,000,000 worth of eggs, it is estimated, are imported into this country each year.

The relative weight of an egg in shell and lining material, 106.9; albumen, 604.2; yolk, 288.9; one-half the egg is nutriment. The nutriment of meat is rated, at best, as only one-fourth. Consequently, one pound of eggs, in nutriment value, is equal to two pounds of meat.

The average weight of a dozen eggs ranges from 15 to 24 ounces, but single specimens have been known to weigh four ounces each.

Ten years ago Collingwood estimated that the hens of the previous year packed inside the shells of the eggs, in round numbers, 650 tons of water--sufficient to fill a canal one mile long, 20 feet deep, and 300 feet wide. The shells required to hold this water contained 110,000 tons of lime. An acre of corn requires about 300 tons of water during the growing season to produce a full crop. The hens of the country that year put enough water into their eggs to irrigate over 2,000,000 acres of corn.

According to a large number of analysis made of domestic eggs at the various agricultural stations, an egg weighing two ounces has the following percentage of composition: Shell, 10.5; water, 6.6, fat, 9.3; and ash, 0.9. A side of beef contains on an average about the same percentage of protein but a larger percentage of fat. Eggs belong to nitrogenous group of foods, and would naturally and quite properly be combined in the diet with material supplying carbonydrates (sugar and starch) such as cereals, potatoes, etc.

There is four per cent less protein, and six per cent less of fat in eggs than in sirloin steak; half as much protein and one-third as much fat as in cream cheese; twice as much protein and ten times as much fat as in oysters. Fuel value: about one-third that of rich cheese, and two-third that of beef. It is the protein nitrogenous matter builds up and repairs the tissues of the body, while the fat supplies energy.

It has often been claimed that the white of an egg is pure albumen, but that it also contains phosphoric acid and sodium chloride or common salt has been proved. The fatty part of an egg, also phosphorous, calcium magnesium, potasium and iron, are contained in the yolk. There is also sulphur in the egg, which , no doubt, accounts for the dark stain left by eggs on silver.

Medical science says that raw eggs are more quickly digested than cooked ones. Soft-boiled, roasted and poached are more easily digested than when fried or hard-boiled. The stomach will digest a raw egg in from one and a half to two hours. Soft-boiled and roasted require from two and a half to three hours, while hard-boiled or fried must be allowed from three and half to four hours for digestion.

Eggs should be held in a rack, end down, so that the air can strike them, and they should be turned every other day. They keep best in a room or cellar where the temperature ranges between 40 and 60 degrees.

Years ago the Boston market received quite a reputation for green geese, owing to the style of carcass and the manner of dressing them. The tail and wing feathers, and a ruff around the neck were allowed to remain. Ever since then geese dressed in that style are termed "Boston Geese".

Great size of an abdominal pouch in a goose indicates great age, a fact that is useful in purchasing breeding stock.

Eating goose at Michaelmas was a very early custom in England for as far back as the 10th year of the reign of Edward IV (1471) John de la Haye was bound to render to William Barnaby, Lord of Lastres, in the county of Hereford, for a part of the demense land, one goose fit for the Lord's dinner on the feast of St. Michael, the Archangle.

The turkey crop hatched previous to June 1st, should attain good growth by last of November, the cock birds reaching 10 or 12 pounds.

The turkey is not fully matured until two years of age, and is in the prime at three years, and nearly as good at four years old. It is therefore a mistake to sell off all the older birds and retain the young ones for breeding purposes.

Young turkeys are of a delicate nature until they are fully feathered and have thrown out the red on their heads, which usually occurs at about three months of age. After that they are hardy, and may be allowed unlimited range at all times.

There are a number of dont's that should be observed by market poultry. Don't ship bony, skinny stock. Don't ship half-picked, flesh torn poultry. Don't ship to every strange house that solicits your consignment. First look them up; investigate the references. Don't ship dressed stock in any old box that may be handy. It pays to use clean, fresh boxes, using care and neatness in packing. Frequently the buyer is present when the box is opened, and a sale spoiled because of the packing.

Thus far, nobody has started the rounds trying to sell stock in those submarine mines.

CRASHING VICTORIES

More Firsts and Seconds than any one competitor. Wins in detail:—1st Pen, 1st Cock, 2nd Hen, 5th Ckl., 2nd and 3rd Pullets.

Eggs $10.00 per 15, duty paid. Mating List and Illustrated Catalogue free.

FONTHILL, ONTARIO.

Don't pack poultry after dressing until all the animal heat is out. Don't let some little market fluster cause you to change houses. Get a good, solid house and stick to it. That keeps the commission man interested in retaining your trade, and oftentimes he will pull you out of a hole caused by a glut. Don't fail to carefully inspect your shipment before closing the box. Put in the memorandum on your own bill head, showing the count and other data. Keep a duplicate yourself, thereby saving much annoyance and frequent loss. Don't chase off into a new market with untried people just because of a possible temporary advantage. Nine times out of ten you will lose. Don't fail to notify your commission house before or at the time you ship and give full data, so he can know what is coming, and can prepare to handle it rapidly.

Shippers of live poultry should never use coops which are too small to carry the poultry properly. Poultry arriving in a cramped and wretched condition will not command satisfactory prices, and furthermore the commission man is apt to get himself into serious trouble with the Society for the Prevention of Cruelty to Animals unless the stock is removed immediately into other coops, and these are not available at all times.

Green bone is very rich in phosphate of lime.

Rub the window panes well with old newspapers—it will let in the sunshine.

Overgrown fowls are no better in any particular than those of normal size. The breeding, care and selection designed for increasing size, had better be devoted to the development of laying qualities and table quality instead of quantity.

Careful breeding, proper feeding, and the right kind of care, will produce heavy laying in any breed.

Sudden fright and excitement at once tells on the egg crop. Never allow strange dogs about where the hens are.

The first eggs of the brown-egg layers are generally of a good color, but as the hen increases her laying she decreases the amount of color, owing to the gradual loss of the pigment which colors the eggs.

Never send a fowl to market that has a full crop.

Dry-picked poultry will stand longer shipments than those that are scalded.

In dry-picking pluck the feathers while the body is still warm.

James Rankin says he never sold a broiler in his life, for the reason that the broiler age is just the time when all the danger of mortality has passed. The last two or three pounds can be put on much cheaper than the first. Whoever raises beef or pork knows that this is so. He holds his chickens until they are four and a half months old.

TRENTON FAIR.
Sept. 27 to Oct. 1 1915.

Harvey E. Rogers, Superintendent of the Poultry Department of the U-Kno-Us" Trenton Inter-State Fair of New Jersey, announces that Messrs. Hicks, Schwab, Punderford and Minich will place the awards for the coming exhibition to be held September 27, to October 1, 1915. Premium lists will be ready August 1, and secretaries of speciality clubs desiring to offer their club ribbons should correspond at once with Harvey E. Rogers, 1520 Nottingham Way, Trenton, N. J.

This poultry exhibition at this fall fair is increasing in interest every year and is now ranked as one of America's best fall poultry shows. From the present indications, this season's event will eclipse all others, both in size and quality throughout. J. T. H.

NO MORE WHITE DIARRHEA

If you use "OCULUM", the CELEBRATED NEW DISCOVERY which KNOCKS IT in two minutes. Not used in FOOD or WATER. ENTIRELY DIFFERENT from anything you ever used.

Used and endorsed in EVERY STATE.

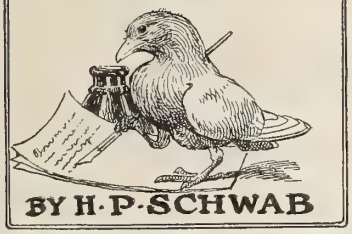
NOTES and COMMENTS



The Wilburtha Farms, Trenton, Junction, N. J., have lately issued their annual catalogue of which we have a copy. Without exception this is the finest poultry catalogue we have seen. It is in two colors all through, original in design and text and perfect in work. These farms are devoted to the breeding of S. C. White Leghorns, Columbian Wyandottes and S. C. Buff Leghorns with Mr. George J. Kerr as manager. Mr. C. J. Fisk, the owner, also gives his personal attention to his farms and poultry and has been the chief factor in bringing this line to the front with records made at New York, Chicago, Indianapolis, Philadelphia, Pittsburg, etc. Breeders interested in this variety should send for one of these catalogues of this dependable line.

The Pittsburg Poultry Association have elected Mr. E. F. Baldwin secretary and will hold their Great Exposition Show January 18, to 22, 1916. Mr. Baldwin has served as assistant secretary in the past, he is a thorough fancier and is in every way well fitted for this office. This Association with Mr. Davis as president and the only Chas. F. Rankin as treasurer have an organization of strong fanciers and breeders who are reliable and capable. This is assurance that the next Pittsburg show will be greater and better than ever. Just copy these dates in your note book now.

The American Light Brahma Club catalogue for 1915 is a credit to the breed and club. It is a beautiful piece of work, full of information and practical articles that are very instructive. The Light Brahmas need no special recommendation from us; they are one of our oldest and best known varieties, bred for practical worth. They are handsome and desirable, a breed that will always be a leader, for what they really are. During the past few years the gain this variety has made is very noticeable. We have seen them in superior quality and greater numbers than ever before at the shows. At the last Madison Square Garden New York show, they were the largest class shown and at Boston, Philadelphia, etc., they were among the leaders. The Light Brahma Club is a live one, full of progress and are backing up the variety with rare skill and endurance. Among their officers are men famed the country over as breeders. Mr. Joseph Elias is president, Mr. Harvey C. Wood, Bound Brook, N. J., Secretary. Executive committee: Mr. F. M. Prescott, chairman; W. A. Hendrickson, E. W. Rankin, C. I. Balch, J. W. Shaw, Douglas T. Taylor, Mrs. Ella V. Robinson and A. V. Prescott. Club ideal cuts are shown, making this a valuable book. Breeders of Light Brahmas should write Secretary Wood and join the club.

The special sale list of Mr. E. B. Thompson's Ringlet Barred Rocks is at hand and as usual it is complete and chuck-full of exceptional "Ringlet" bargains. The record made by this line is of surpassing value and in this sale Mr. Thompson offers birds from his best breeding lines at most reasonable prices. This booklet is for the asking.

The C. F. Webster line of White Rocks, Girard, Pa., has had a most successful season. Mr. Webster now is offering for sale a share of his breeders at greatly reduced prices also eggs for hatching at half price. Write him for particulars.

Note our Prize Contest. This should interest you. We want a subscription agent in every section and we will pay well. Write for terms and supplies. Get busy now.

In our next issue we hope to have news from the Allentown Fair, Hagerstown, New York State Fair, etc. Keep these events in mind. Show your birds and make your start now.

Just tell Everybody that you saw their ad in "Everybodys." Give us credit due.

We can supply you with any poultry, farm or live stock book or magazine in special club offer. Write us your wants, our prices will save you money.

Suggestions Wanted—Tell us how we can improve "Everybodys" and how we can make it of greater value to our readers. We want you to work with us in this, help us to issue a greater magazine and prove of the greatest value to the industry. We thank you for advise and information at all times and upon all subjects. Write us freely.

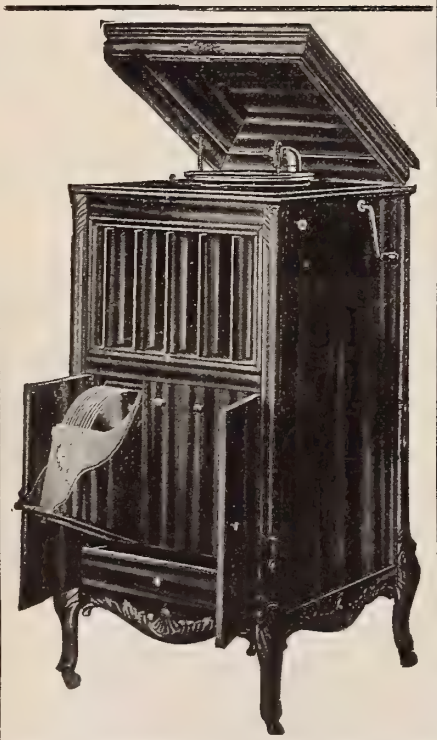
FIRST PRIZE



COLUMBIA Grafonola De Luxe Costs $200.00.

Still We Offer You More

We believe in this way we can get the best possible class of readers. We want class. Your efforts will mean **Real Money** for you, besides you are competing for our Grand Prize offer. Don't fail to read this list carefully as the Prizes are well worth your time and will many times repay for your efforts.

But This Is Not All

The regular subscription price to "Everybodys" is 50 cents the year, but to agents in this contest it is 25 cents. You keep all over 25 cents received. For the first six subscriptions you send us, with $1.50, you will receive copy of the book wanted as per above offer and these subscriptions will also count for the **Grand** Prize Offer along with all other subscriptions you send us. All we ask is the 25 cents for each subscription taken.

To-day is the Time to Start

"Get Busy." Start today and be one of the first. There is advantage in this. Subscriptions for **"Everybodys"** are easy to get. There is no better **Poultry Magazine** issued; it is of special interest to the whole family and every home needs it regularly, they will benefit by it.

We will furnish you with subscription sheets, also with sample copies for use. Remember our regular subscription price is 50 cents the year, but to subscription agents in this contest, it is but 25 cents, so you are at liberty to take subscriptions at the price you think best; some agents give all their commission to the subscriber and in this way probably get many more subscriptions. We leave this for you to arrange according to your condition. See other page. Always address,

Everybodys Poultry Magazine Publishing Co.
HANOVER, - - PA.

---LIST OF GRAND PRIZES---

1st Prize--Columbia Grafonola "De Luxe" $200.00

This instrument represents the apex of achievement in cabinet instruments. There is none better made. It is of the highest and finest grade. (See illustration.) . .It is 49 3-4 inches high, 22 1-2 inches wide and 24 inches deep.

2nd Prize--Columbia Grafonola "Mignonette" $100.

Its appearance is dignified and artistic and is of the same high quality as the larger size above. . .It is 44 3-4 inches high, 21 1-2 inches deep and 19 inches wide. See illustration.

3rd Prize--Columbia Grafonola "Favorite" $50.00

A popular "Favorite" with all lovers of music. This, like the above instrument, is fully equipped and can be had in Mahogany or Quartered Oak in Golden, Fumed or Early English finishes. See illustrations.

Seventh Prize---$15.00 "

Eighth Prize---$10.00 Pair of Fowls, Incubator or Brooder, Your Choice.

Ninth Prize---$10.00 "

Tenth Prize---$10.00 "

In making your selection of Fowls, Incubators, or Brooders, they must be selected from advertisers in Everybodys

All the Music of All the World

Can Be Had With the "Columbia Grafonola"

The voices of all the world's artists who have ever made disc records, without exception, are at your command if you own a Columbia. Because, although a majority of them make records exclusively for the Columbia Company, the instrument itself is so constructed that other makes of records can be played—the records are interchangeable.

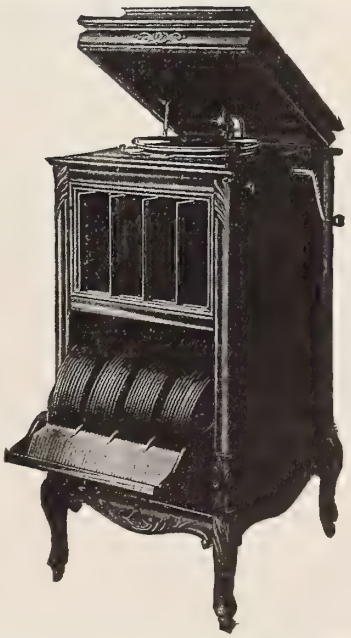
Our catalogue will help you to gather a fair idea of the unequalled range of the Columbia repertoire and the unlimited variety of music that is engraved upon Columbia Records and reproduced by Columbia Instruments. Not only the voices of the great artists of opera, in solo and in concert numbers; not only the recordings of the world's great masters of the violin and of the piano; but the music of the great orchestras and bands, and of the soloists of those organizations, and the songs and humor of the stars of every stage—music for your every mood and for every occasion that music meets; music for the quiet family hour, for the cheer of visitors, for the dance, for indoors or outdoors, at home, on the yacht, at the club, in the church and in the school. **This is truly "the one incomparable musical instrument," and "the one most versatile and indispensable entertainer."**

"THE BABY OF THE HOME CAN PLAY IT"

Special Instructions to Agents

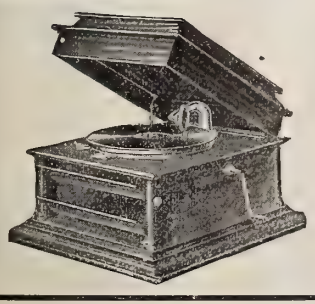
1st. Renewals count the same as new subscriptions. 2nd. Cash must accompany all subscriptions; this will avoid all misunderstanding. 3rd. Keep a duplicate list of all subscribers sent us, in case any question arises when the contest closes. 4th. In case of a tie, the value of the prize will be divided. 5th. This subscription contest closes September 15, 1915. All letters postmarked that day will be counted, thus giving those at a distance an equal chance with those near. 6. A list of all winners will be given in the October 1915 issue. 7. All agents may work where they please; this is fair to all. Send for more supplies at any time. 8. No subscribtions can be sold for less than 25 cents. 9. You must send at least six subscriptions to entitle you to agents commission on prizes. 10. All subscriptions must be taken on the merits of the publication. 11. **Notice.** Take three years subscription to "Everybodys" for $1.00 to any one party. Send 75 cents and keep 25 cents as your commission; this will count as four subscriptions on the contest.

SECOND PRIZE



COLUMBIA GRAFONOLA "Mignonette" Cost $100.00
Free to person sending in the second largest number of subscriptions before Sept 15.

THIRD PRIZE



Do Not Now Delay to Enter This Contest

Remember you are to send us only 25 cents for each subscription. You keep the balance for your commision. This opportunity is yours to accept. You receive your choice of the Poultry Books offered for the first six subscriptions you send us. Send for sample copies and subscription blanks today. they will be supplied at once, free of charge. Start today as you will be getting in on the ground floor.

HANOVER, - PENNSYLVANIA

How to Keep Down Vermin

By Mr. John S. Martin

An Important Question—The Different kinds of Lice Found on Fowls —Where to Look for Them—How to Exterminate Them.

The following article was, primarily, written for the amateur poultry-keeper, and it shall be my endeavor to make it as simple as possible by avoiding technical terms. To the experienced poultryman this may seem a very threadbare subject, but with the hot days of July, unless great vigilance is used, it certainly becomes a very live question.

There are many kinds of chicken lice, but the kinds which are most met with and which have discouraged many a beginner, are Red mites, body lice, feather lice and head lice, which I shall describe in turn.

Red mites are small red insects, so called from their size and red color. This color they do not always have, being at first white or grayish in color; but after they become filled with the blood of the fowls their color changes to a bright red. Their habits are most peculiar. During the day time they take refuge in the cracks in the roost or dropping boards, and at night they come forth to prey upon the hens. They are most likely to be found under the nailed ends and on the underside of the roosts. If there are any knot holes, be sure to examine them for lice. Then again, mites are often found in the nest boxes, especially if hens have been setting in them. For this reason, setting hens should be dusted frequently with a good insect powder, and after the chicks hatch, the nest should be thoroughly cleaned before using it again.

The hot weather of the summer months causes the mites to multiply very rapidly, and if they once get a start, vigorous measures must be resorted to in order to exterminate them. Time and again I have no ticed chicken houses so badly infested with mites that the hens had to quit roosting in them. The owners either did not know how to get rid of them or they were too indolent to do so. At any rate it is very careless for anyone to let the mites get control of affairs.

For a house that has become thoroughly infested with them the following treatment will be necessary. Take out the roosts, dropping boards, nest boxes and burn them. Clean the whole interior, as well as you can. Then close all the doors and windows and fumigate the building well. This can be done by covering the bottom of an iron pot or kettle with coals and then sprinkle on these coals a few handfuls of sulphur. You will need to get out of the building quickly, as the sulphur fumes are very penetrating. This should be repeated several times, as in addition to killing the mites, sulphur is a good disinfectant. As soon as this is done the interior of the house should be thoroughly whitewashed, and it would be a good idea to mix a little carbolic acid in the whitewash. After this, fresh nests and roosts should be put in, and right here let me mention how to fasten the ends of the roosts. The upright pieces on which the ends of the roosts rest have notches cut in them. Both ends of the roosts are notched on each side about an inch from the end, so that they fit into the notches cut into the upright pieces. The notches form a sort of collar to hold the roost in place. The purpose of this arrangement is that the roosts are not nailed down, and can be lifted up, examined and thoroughly sprayed with some liquid lice-killer. Every poultryman should have a small hand sprayer, and by spraying the roosts every week during the hot weather no danger will be experienced from lice. Just before the hens go to roost is a good time to spray the roosts, as many of the mites have come from their hiding places. First spray the upper side of the roost, then turn it over and give it a good spraying on the under side. Then spray the dropping boards. This being done in the evening, leaves such a strong odor that if the hens have any body lice it will often kill them as well.

Body lice, as the name indicates, live on the bodies of the fowls. They are flesh-colored and are considerably larger than mites. Although they may be found on any part of the fowl's body, they will be generally found, if anywhere, in the long fluffy feathers on the thigh or in the fluff about the vent. The best and easiest way to get rid of them is to see that the fowls have good dust baths. In the winter time these must be provided, but in the summer time, if the soil is light the fowls usually make dust baths by digging out a hole in the sod. If you wish to make sure work of them give an occasional dusting with insect powder. Body lice are very active and if you are looking for them move the feathers quickly.

The feather louse is about twice as long as the body louse, and is dark gray in color. They will be usually found on the hackle feathers. For some reason or other male birds are more liable to have them than the females. Probably it is because the males are not always as careful about dusting themselves regularly as the females are. If you have any males cooped up they should be dusted freuently to keep them free from feather lice.

Head lice are very disastrous to young chicks. They are about the same color as feather lice but not hardly as long. They are found on the heads of the chicks and if not attended to promptly they will make a very heavy mortality. It is the chicks raised with hens that suffer, as in a clean brooder there should be no danger of head lice, and this brings up a peculiar circumstance, one that as yet I have never received any light upon. If a hen is kept perfectly clean of body lice the chick

CHICKS 400,000 For 1915

from flocks winning at Chicago, Boston and Cleveland. Strains having 256 egg average. White and Brown Leghorns $3 per 25—$5.50 per 50—$10 per 100. Have a Conkey Corner in your Poultry House

will have no head lice, but if the hen has body lice the chick is sure to have head lice. Surely there is some connection between them. If you wish to have no trouble from head lice on the chicks, keep the hen well dusted with insect powder while she is setting. When the chicks hatch give both them and the hen a thorough dusting and repeat this every five or six days until the chicks are feathered out. A drop of lard rubbed on the chick's head is sure death to the lice, and I often use it when I wish to treat a large number, as I believe it lasts longer than the powder. This should be done at night while the chicks are under the hen, as that gives the lard a chance to dry before morning. Besides, the chicks are quieter and can be handled more easily than in the daytime. In dusting or greasing a brood of chicks, it is best to put them all into a box or basket with a cover to keep them in. Then dust the hen and afterwards, the chicks, putting them back under the hen, one by one. In this way the work can be thoroughly done, as not a chick will be missed. Do not wait until the chicks show evidence of having these head lice, because they can have them as soon as they are hatched and yet not show any bad effects for a week or two. The first sign is that the chicks do not seem to grow as they should. Their beaks seem too long, their wings droop and they stay about the coop with a plaintive little chirp. This is a sure sign that you have been neglecting them. Before closing I shall describe a home-made dusting can for using insect powder. Those we buy are really very poor affairs, because sometimes we can puff and puff and not get a bit of the powder. Then we shake it up and a great lot of powder comes out all in one place. The can I use is made by taking an ordinary can about three inches high and one and one-half inches across, such as are found around nearly every house. The top is taken off, the can filled with insect powder, and a piece of book muslin is tied on tightly. A can with a small furl around the top is the best to use, as it helps to keep on the muslin cover. Such a can will make the powder last about as long again, because none of it is wasted. The can and the powder should be kept in a dry place because when it gets damp it does not work as well.

GRAHAM'S CRACKERS

By LOUIS P. GRAHAM, Vineland, N. J.

How quickly some folks change their dress when they see advanced style set by someone else?

"Link" Orr, an Irishman? Link told me last August at Chicago that he was Scot. There are mighty few Scots who will placidly permit themselves to be classed as Irish.

A couple of years ago, when the Order of Fleas was in its formative stage, about the worst "panning" it received was from the editor who lately devoted considerable space to an extremely commendatory write-up of the same order, all of which goes to prove that "nothing succeeds like success" also that it is better to "hook on" to the band wagon than to be one of the army of spectators.

In every line of business there are common usages and abuses which are in the main tolerated, because of lack of time to put in motion and follow to a finish some schemes that will weed out the leeches. The Poultry business is no exception. In it we have men who are neither fanciers nor breeders, and whose only excuse for a connection of any kind with the business is that it is a "rich graft." Chief among these is the Poultry Farm Real Estate men. They advertise all over the country, sending out handsomely illustrated booklets, giving glowing accounts of the success of chicken rearing in the locality in which they operate and showing photograph of wonderful and extraordinary crops, etc., intimating that this is the regulation product. Look out, Mr. Beginner, or you will get "stung." Before you buy, be sure to consult the local poultry association and the neighbors, and find out the value of the property which you are considering. Be very careful of the glowing accounts of success with commercial poultry. Just keep in mind that it is not possible for anybody and everybody without previous training and experience to plunge into a poultry farm and make it pay.

There is no business in the world so little understood or taken less seriously by the general run of people. Everybody has in his "back to nature" thoughts a well defined notion that a few hundred hens will pay all expenses, while he or she sets back and twiddle thumbs. Don't you believe it; it is a job of seven days a week and three hundred and sixty-five days a year. No vacation for two weeks to Maine or the seashore, just remember that reverses at any time will wipe out all your careful effort during the previous part of the season and result in a great financial loss.

A commercial poultry farm is no place for cripples, invalids, nor those physically or mentally weak unless you have money to buy brains and brawn, but you will find that it will be hard to make the hens pay for this. If you are well and healthy, bright and active and willing to work, you may make a success provided you also "know how."

The result of the election is announced and the American Poultry Association has honored with the presidency, Mr. E. E. Richards, of Cedar Rapids, Iowa., who is thoroughly deserving of the office and should be supported loyallly by the membership. Vice-President, Mr. A. A. Peters, of Denver, Colorado, who has served the association faithfully as an officer and executive for several years. Mr. Campbell as usual, and deservedly, was re-elected secretary. Mr. Campbeel has been the most efficient and courteous secretary that the association has ever had. His administration of his office has been admirable and a fit model for his successor when Mr. Campbell chooses to step down and out.

This is a highly important office in the A. P. A., and the association should think long and hard before it changes to another than the present "tried and true old wheel horse" that now fills the position.

The Honorable Joseph Russell was defeated for the vice-presidency. Formally he was second vice-president, but upon the abolishment of this office, a contest between Mr. Peters and Mr. Russell for the office was inevitable. It seems that in as much as both are estimable gentleman and men of worth and solidity. The association should have kept in mind that this is an "American Poultry Association' 'and have honored Canada by electing Mr. Russell.

The selection of San Francisco was mainly sentimental. Many voted for it under the assumption that it was "due" to the west. Few considered that the time selected is the same as the dates of the Panama-Pacific Poultry Show, which is in direct contradiction of that provision of the constitution, which provides especially that the annual meetings of the A. P. A. shall not be held in conjunction with a poultry show.

The date is also unfortunate that it conflicts with a number of second class eastern and middle west poultry shows. This means that to attend the American Poultry Association

LAURELTON FARMS
WHITE LEGHORNS

For Sale

5,000 Hens

5,000 Eight Weeks Old Pullets.

If you know anything about Laurelton Farms, you know that we have over 10,000 business hens here, that lay eggs for the finest New York Market.

First and foremost, they must be a high average egg producing strain, or we couldn't make this farm yield dividends to the stock holders.

It happens that just now we have surplus of 5,000 hens and 5,000 8 weeks old pullets.

It's your chance to get some of these fine Laurelton Layers at a reasonable price.

Hens $1.50 Each
Special Prices on Large Lots.

Pullets $5 for 5
Special Prices by 100

LAURELTON FARMS
Box 17
Lakewood, New Jersey

meeting, an eastern man must desert several of these shows, in as much as the entire trip will take about three weeks out of the show season. It also means an expenditure of a couple hundred dollars. From an association view point, the American Poultry Association is going to San Francisco to be a very small frog in a very large puddle. To divide honors with a hundred other associations, which are also going to hold annual meetings in conjunction with the Exposition and as a result many A. P. A. men will undoubtedly be intensely disappointed at the failure of our convention to attract the attention and favor usual in the past.

In addition the cost of this convention will be a tremendous drag on the treasury of the A. P. A. and after it is over, we will find ourselvse "badly bent" if not "broke." With a long eight years of annual expenses to travel through before additional revenue may be obtained by the issuing of a new Standard, it looks as though the anticipated hard times for the A. P. A. are directly ahead of us.

Taken altogether, it seems that the voters have shown very little regard for the future and finances of the old association and have not considered this as an annual "business" meeting (as it is) and applied business brains and forethought in the selection of a meeting place. Neither have they considered how many good and efficient workers, who pay their own way, that will be absolutely prevented from attending because of the prohibitive cost and loss of valuable time. Taken altogether, the attendance will be mostly officers and local members. Many will say: "Oh, well, there is no busines of importance to be transacted." This may be true, but why spend so much on such an unimportant meeting.

Poultry Doings For the Year Month by Month

June a Month Not Too Late to Hatch Chicks, Shade Necessary During the Hot Weather. Head Ticks Carry off More Chicks Than Most People Here Suppose.

By Frank F. Conway

June, and what a glorious month it usually is, and, by the way, is it not a busy month too, especially with the poultry raisers? May, up to now, has not been all what one would desire, in fact it has been rather disappointing, cold, wet, and disagreeable. The preceeding month, April, gave far more favorable weather and it would seem though if April had put a March on May, as May had certainly a touch of the March hare about it, at least that is what we in the east experienced.

By the time these lines appear in print there will have been many thousands of chicks hatched, and those who were fortunate enough to raise a large number of early ones, will have a splendid field to dispose of them at good prices at this time for the market as broilers and roasters, or later on for the early fall shows; but from reports gathered in from many parts the early months have not yielded as many chicks as in former years, the general complaint being weak germs, resulting in the chicks dying in the shell on the tenth day of incubation, and fertility in general being very low, due no doubt to the changable weather, meaning long confinement from which generally springs many kindred causes, Those who have not been able therefore to raise as many as was anticipated would be well advised to still hatch as many this month as is possible, especially the Mediterranean breeds and those classed among the light-breeds, as with a little care and attention these will mature rapidly and be in line with the earlier ones at the late winter shows, also for the breeding yards in the spring of 1916. I believe there are more chickens hatched in the months of May and June than all of the rest of the months in the year and I think I am safe in saying more Madison Square winners are hatched in those months, also if you Mr. Reader, wish to be in line with the others, get busy now; don't put off any longer and thereby make it harder for you to compete with your neighbor when the right time comes along for comparison Chicks hatched this month will thrive and go ahead and catch up to the earlier ones by the late fall if proper care and attention is given them. It will, however, be necessary for you to give them lots of shade during the hot weather by placing them under trees or such like. To those who are void of such shade, an excellent idea is to grow some corn which affords excellent shade and holds the moisture in the ground into which the chicks can run, picking up insects and animal food, besides preserving that natural bloom to the feathers when they are growing their adult plumage. I know of nothing more suitable for shade for the growing chicks than this, as it is rapid in growth and can be harvested in the late fall. Beware of lice and most of all head ticks, which without a doubt kill more late hatched chicks than any other cause. It is a good plan to treat the heads of every chick, hatched from a day old to two months old, with a preparation composed of the following: One ounce of Mercurial ointment, two ounces of lanoline, and one-half ounce of coal oil mixed well and thoroughly but scantily to the heads of every chick at least twice a month until they are two months

Mr. H. Armstrong Roberts, of Beverley, N. J., says: "My flocks, old and young alike are in the pink of condition, which means heavy egg-yield, fertility and vitality. They are all fed a mash containing—

of age. Provide the chicks with lots of fresh water well shaded, or better still, sour milk, which is one of the very best preventatives against that dreaded white diarrhea, Charcoal and fine flint grit is also necessary for their welfare. Should the chicks show signs of diarrhea remove the droppings that adhere to the vent and apply a little vaseline and give as a feed bread and milk which has been sprinkled with ground ginger and nutmeg, also powdered chalk, feeding this for two days, twice a day which will usually effect a cure. During this time of the year, not a few poultry raisers are troubled with "gapes" an irritation of the throat which, if not checked at once, soon extends to the whole flock causing a great many deaths. All such chicks should be immediately removed from the flock and the rest moved to fresh ground, or if this cannot be done, the ground spaded, over, and before each brooding coop place a head of fresh manure from the horse stable for them to scratch in which contains a certain amount of ammonia gases distructive to the gape worm that adhere to the wind pipe of the chicks. This disease should, however, never be allowed to appear as it is usually caused from chicks being raised on the same ground year after year which becomes sour, sometimes also from water that has been allowed to lay around in the sun and become stagnate.

Don't forget the white wash brush or spray to keep down the mites that breed in thousands these months if one is not on the look out. Go into every nook and corner in your coops and nest boxes. You will find a mixture of the following very satisfactory, both as a disinfectant and lice killer.

Rock lime, well slacked, mixed with sufficient water to make it cream thick, adding a tablespoonful of crude carbolic, two tablespoonful of oil of tar, and one large handful of salt to the pail of white wash. If it is desired make the white wash lasting, add a quart of linseed oil to the pail as well, which idea is excellent should you wish to whiten walls exposed to the weather.

You can reduce the percentage of mortality to a minimum if you start your chicks on

THE ANCONA.

By R. W. Van Hoesen.

The recent consolidation of the old Ancona Glub of America and the newer Ancona Club, into one large strong club, known as the United Ancona Club, brings to the attention of the poultry world this ancient and worthy breed.

Anconas have been bred in the United States but twenty-five years, but in England they were an old breed, before they were introduced into America, and in their native, Italy, they have been bred far prior to any recorded information concerning breeds of fowls.

I am pleased to write for the benefit of the readers of "Everybodys" Poultry Magazine, the most pronounced characteristics of the Ancona fowl.

1. Eggs. That is the Ancona specialty, and is where they excel to the greatest degree. Anconas are persistent layers, begin laying at sixteen weeks old, if properly reared, and lay a white egg of large size. In the Missouri laying contest for 1914 the Ancona eggs were the heaviest of the twenty breeds in the contest.

2. Vigor. Few fowls are as strong and active from the shell to old age as are the Anconas. They are excellent foragers on free range, egg fertility is high and at twenty weeks the young birds are fully developed.

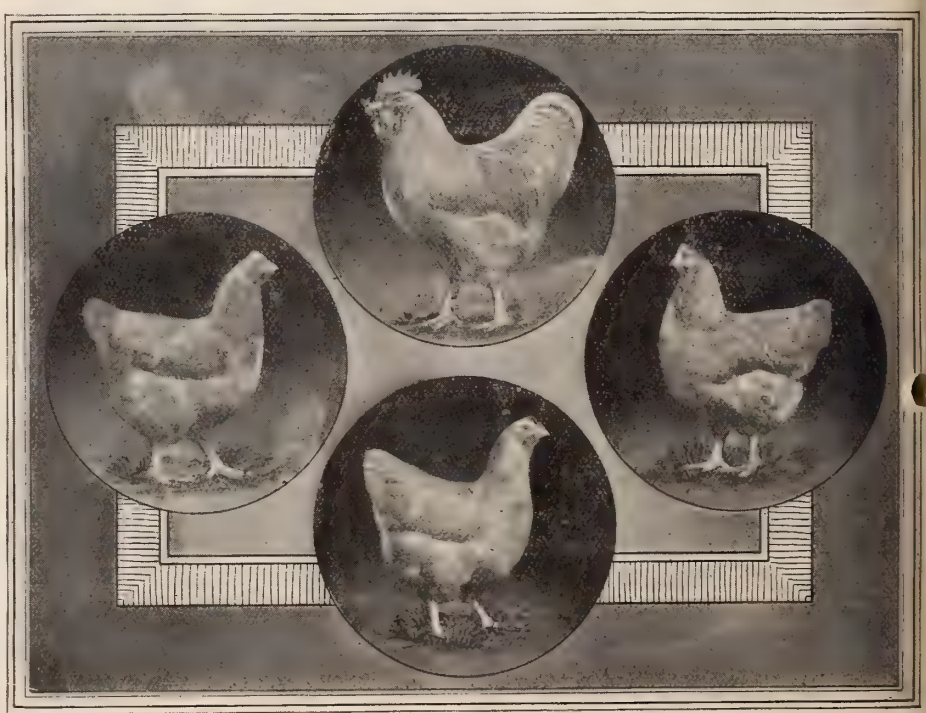
3. Beauty. A black background, having a very pronounced green sheen, and about one-fifth of the feathers tipped with pure white, yellow or mottled legs, white or creamy ear lobes, an alert carriage and active demeanor—all these make of the Ancona one of the most attractive of all fowls. Their uniformity in breeding adds to the beauty of a flock, and they never fail to catch and hold the eye of a true fancier.

4. Profit. As herein before mentioned, the Missouri contest showed the Ancona fowls produced the most eggs, per one hundred pounds of feed consumed, and they also showed the largest per cent of eggs from November to May, when eggs are both highest in price and in greatest demand for hatching. These figures were not of individual hens, or pens, nor for any month, but were averages for the entire year, of twenty standard breeds, aggregating over one thousand hens. Details were minutely recorded and the records sworn to by the experiment station chief. This was the greatest boost ever given a breed of fowls, and corroborates the claims made by Ancona breeders, generally, during the past five years.

The new 1915 revised Standard of Perfection will for the first time include illustrations of the Ancona. The engraving that accompanies this article is from a photo of a prize winner, bred and owned by the writer. This hen never moulted lighter than here shown, though five years old and yet a very good layer.

There are but two varieties of Anconas—rose and single comb and they differ only in head gear.

They have the size and general characteristics of the Mediterranean and are well worth a place in the yards of the American Fanciers and Breeders.



The above illustration gives the reader an idea of the breeding stock produced at the Old Forge Buff Orpington Farm, Spring Grove, Pa. The females in above picture are closely related to the females which won the cup for highest score at the Missouri Egg Laying contest in November last at Mountain Grove, Mo. Here is a wonderful collection showing how utility can be combined with exhibition and is practiced by M.. Gattelter, the owner. J. T. H.

The National Bantam Association year-book contains the announcement that Buffalo, N. Y., will have the honor of the National meeting for 1915. As Buffalo Show comes Thanksgiving week, and is just the right time of the year to bring out a big class, we trust that the Bantam breeders will show in force and make this years exhibition the largest National event ever held by that organization.

The Bantam year-book contains some fine reviews of Bantam classes at several National Shows, and are very interesting reading. In all, the year-book is a dandy and should be in the possession of every Bantam breeder in the country.

"Everybodys" hopes in this department to awaken a new interest in the breeding and exhibiting of the "midgets" of the feathered world. We hope that this will be appreciated by all lovers of these profitable pets, and that our efforts will be rewarded in that this department will become one of the most interesting of our publication.

It is a creditable fact that some of our leading Shows charge a lower fee for Bantams than is charged for the larger varieties and we believe that is right and proper. Once the Bantam breeder is encouraged in this way, we believe the classes will increase in size and interest.

Wherever the Poultry Show management show an inclination to encourage the Bantam breeder, we believe the exhibitor should show his appreciation by endeavoring in every way to bring out a creditable entry, thus showing that all that has heretofore kept down the classes, has been that the Bantam classes have been more or less neglected.

Nothing adds more to the variety of a first class poultry exhibit than a good collection of Bantams and at all shows where their are big classes of the little beauties, interest in them is manifest on every hand.

WILBURTHA FARMS CATALOG.

Beautiful is hardly a word to describe the art catalog of the Wilburtha Poultry Farms, Trenton Junction, N. J. These farms are located at Wilburtha, Mercer County, N. J., on the banks of the Delaware, a short distance from Trenton, the capitol of the state. This modern poultry plant consists of thirty-five acres, entirely devoted to the raising of the Wilburtha strains of White and Buff Leghorns, Columbian Wyandottes and Columbian Plymouth Rocks, also you will find on this farm Pekin Ducks of superior quality.

Mr. Charles J. Fisk, owner of this wonderful collection of above varieties, extends an invitation to all to visit his plant, thus seeing for themselves what a modern plant under up-to-date management can accomplish.

Our readers are so well acquainted with the records made by the Wilburtha line at America's greatest poultry exhibitions, that we hardly think it necessary to enumerate these winnings, suffice to say that this record stands out prominent as a record rarely approached. We briefly mention the wins at Madison Square, Boston, Palace, Chicago, Pittsburg, Hagerstown, Allentown and others, where the Wilbutha birds have made history in the show room.

From the above, (if you are unacquainted with the Wilburtha Farms,) you might think this is only a plant where show birds are considered. Such is not the case, as this modern farm supplies to the trade, superior table eggs in any quantity, and broilers of the finest quality.

When it is remembered that the White Leghorns bred here also include the famous Dune Alpin strain, you will realize that surely the Wilburtha Farms are among the leaders in the White variety, as included in their flock are some wonderfully rare specimens.

In Buffs they have that rare color so much admired by all lovers of the buff variety, together with a uniform type, which has made the Wilburtha Buff Leghorns recognized leaders. Their new records made at Chicago, Boston and Pittsburg, during the past season, is proof positive of the quality. In Columbian Wyandottes the Wilburtha Farms have made wonderful records, and today their flocks contain some of the most wonderful specimens ever bred, including some of the best birds shown at Chicago, Boston, Pittsburg, and Madison Square Garden during the past two seasons. In Columbian Plymouth Rocks they have perfected a strain which has added much to the prestige of this noble variety of the Plymouth Rock family. You perhaps have seen the Wilburtha Columbian Rocks as exhibited at Philadelphia, Baltimore, Allentown, Hagerstown, Central Palace, etc., and know something of their quality. If not, and a lover of this variety, you have missed much

It has been the pleasure of the writer to have seen the Wilburtha "Big Four" varieties at the above shows, and we know whereof we speak

Write Mr Fisk for any information you desire and we are confident it will be given you in such a way that you will at once feel that here indeed is a man who has your interests at heart. Mention "Everybodys" in writing. J. T. H.

The State Poultry Experiment Station, at Mountain Grove, Missouri, in a most attractive way invites entries for their Fifth Annual Egg Laying Contest.

We are in receipt of the Rules and Regulatons, which will govern this contest, which begins November 1, 1915. These Rules are printed in the form of a booklet, and shows in illustrations some of the remarkable females which have made records of 265-286-254-281, etc., during the previous contests.

This booklet in a brief but effective way shows what has been accomplished by these National Contests. Any information you desire, regarding this contest, will be furnished on request of the Poultry Department of the Experiment Station, Mountain Grove, Mo.

The total yield of all pens in the laying contest at Storrs during the month of April amounted to 16,827 eggs or 138 eggs more than for the month of March, thus the average individual yield was just about 56 per cent or 16.8 eggs for each hen during the month. Twenty seven indviduals, however, including Barred and White Rocks, White Wyandottes, Rhode Island Reds, White Leghorns, Salmon Faverolles, and two "Favorite Hens" laid twenty-five eggs each or more during the month.

At the close of the first six months of the contest the hens are relatively 3894 eggs ahead of last year. The following table affords a comparison for the first six months between the present contest and the competition of a year ago, showing the best pen in each of the breeds named.

Breed	1914	1915
White Wyandottes	1070	1019
Rhode Island Reds	824	979
Plymouth Rocks	759	839
White Leghorns	939	880
Experimental Pens	957	836
Average pen score— all breeds	590	629

It is also interesting to note in this connection that at the close of the first six months sixty individual hens including Barred and White Rocks, White and Buff Wyandottes, Rhode Island Reds, and White Leghorns have laid one hundred eggs each or more. Inasmuch as the records of previous years seem to indicate that less than 50 per cent of the eggs are laid during the first six months it seems safe to predict that perhaps 10 per cent of the birds entered in the present contest will prove to be 200 egg hens.

The ten best individuals to date are as follows:

Barred Rock
No. 3 B'kf'd Ctre. Conn. 130 eggs
Rhode Island Red
410 Durham, Conn. 129 eggs
White Wyandotte
151 Columbia, Conn. 127 eggs
White Wyandotte
153 Columbia, Conn. 124 eggs
White Wyandotte
993 Stillwater, N. Y., 122 eggs
White Wyandotte
132 Catforth, England, 122 eggs
Barred Rock
23 Mt. Carmel, Conn. 120 eggs
Rhode Island Red
344 Temple, N. H., 120 eggs
Rhode Island Red
261 St. Albans, Vt., 120 eggs
White Wyandotte
142 Hoghton, Eng. 120 eggs

Report of Missouri and National Contests

Barred Plymouth Rocks Win Cup in Each Contest for April. A Barred Plymouth Rock Pen Also Leads for First Six Months of Contest. The Brood Hen Problem. How to Break Hens From Broodiness. Some Interesting Observations Made.

This is the time of the year when much attention should be given to the broody hens. They will incubate and spoil any fertile eggs left in the nest over night and are getting farther from a laying condition each day they remain broody.

The question of broodiness and its relation to egg production and the question of the relation of egg production to broodiness have been discussed many times both pro and con. One party says he wants the hen which does not go broody while another thinks it is a sign of a good layer.

Regardless of what we wish in regard to whether hens go broody or not,, we are compel to admit that both egg production and broodiness are parts of Nature's plan to reproduce the fowl, and are therefore very closely related to each other.

There is an idea generally prevalent that when a hen begins to lay that she has a certain number of eggs to lay, after which she goes broody. This idea has been proven incorrect as the production of eggs has been proven to be an endless chain, which continues according to the ability given the hen by Nature unless it is interrupted or broken by broodiness or some outside influence such as change in weather, location, etc.

From the investigations we have made so far, we are convinced that broodiness is a condition of the brain and not of the body, for at the time the hen goes broody, she is in a laying conditon, having the different parts of the egg partly developed, but because of staying on the nest, lack of exercise, loss of appetite, and lack of nourishment, the hen takes the egg material back into her own system and uses it as nourishment just as hens do when a sudden change in weather stops them from laying.

A hen is one of the most jealous creatures on this earth and if placed in a wire sided coop where she can see the rest of the flock ranging about the yard, she is very restless, especially if there is a male with the flock frequently calling his mates to partake of a choice morsel of food, and if plenty of food and water are supplied, she eats often, thereby keeping her body built up so she goes laying again in a short time.

The plan followed here at the Experiment Station is to place the hen in this kind of coop on the day after she remains on the nest and does not lay, she is kept in the coop four days and then released. During the time she is left in the coop she is given all the feed and water she wants. About 4,000 hens are treated in this way each summer at this place. The records show that hens broken in this way begin laying again as follows:

The time from laying the last egg till the hen began laying again was 10 days in March, 8 days in April 10 days in May, and 12 days in June. There are more broody hens in June than in April, but for practical purposes we might say the average is 10 days.

These coops can be easily built by anyone out of scrap lumber and a little wire.

This point is well worthy the consideration of the producer, not only from the standpoint of production, but from the standpoint of quality of the eggs, for the broody hen is the cause of many spoiled eggs going to market during the summer season.

Missouri Contest.

The contest is moving along nicely with all hens doing their best. The three highest pens for six months in the Missouri Contest are Plymouth Rocks. This would indicate that the larger breeds, if properly selected and bred, can be made to produce eggs in great numbers.

The ten highest pens are as follows:

Pen 34 Barred Plymouth Rocks, 508 eggs; Pen 40 Barred Plymouth Rocks, 496 eggs; Pen 38, White Ply-

mouth Rocks, 494 eggs; Pen 26, Buff Wyandottes, 487 eggs; Pen 4, S. C. White Leghorns, 466 eggs; Pen 47, Buff Orpingtons, 454 eggs; Pen 36, Buff Plymouth Rocks, 452 eggs; Pen 14, S. C. White Leghorns, 450 eggs; Pen 2, S. C. White Leghorns, 447 eggs; Pen 24, White Wyandottes, 446 eggs.

It will be noticed that of the six highest pens for April, two are Rocks, two Wyandottes and two Leghorns. They are as follows:

Pen 34, Barred Plymouth Rocks, 122 eggs; Pen 10, S. C. White Leghorns, 119 eggs; Pen 26, Buff Wyandottes, 119 eggs; Pen 0, S. C. White Leghorns, 117 eggs; Pen 28, White Wyandottes, 115 eggs; Pen 38, White Plymouth Rocks, 115 eggs.

Of the six highest hens for six months, three are Rocks, two are Leghorns and one Wyandotte. They are as follows:

Pen 4, hen 4, S. C. White Leghorns, 142 eggs; Pen 14, hen 3, S. C. White Leghorns, 118 eggs; Pen 38, hen 4, White Plymouth Rock, 116 eggs; Pen 40, hen 1, Barred Plymouth Rock, 113 eggs; Pen 23, hen 2, Buff Wyandotte, 108 eggs; Pen 34, hen 5, Barred Rock, 108 eggs.

Pen 34, Barred Plymouth Rocks, won the cup for April by laying 122 eggs.

The total eggs laid in April was 5107 which is 20 eggs per hen as the average.

Considering the breeds instead of variety for the first six months of the contest, the average is as follows:

Plymouth Rocks, 84; Orpingtons, 76; Leghorns, 72; Langshans, 81; Mo. White Fluffs, 68; Wyandottes, 81; Reds, 69; Anconas, 71; Campines, 67; Minorcas, 77.

Various estimates ranging from 60 to 80 eggs are made for the average hen the country over. It will be seen that every breed has averaged that number in six months where fed and cared for properly. The above estimate of 60 to 80 eggs is for the average yearly record of the average farm hen.

The National Contest.

The National Contest is not as even as the Missouri Contest which is accounted for by the fact that many of the birds were shipped great distances and it required some time for them to get accustomed to the climiate and other conditions which were not the same they had been used to. They will likely make good records from now on.

Of the ten highest pens in the National Contest, six of them are Leghorns, two are Rocks, one is Orpington, and one is Rhode Island Whites. They are as follows:

Pen 21, S. C. White Leghorns, England, 485 eggs; Pen 75, Rhode Island Whites, Illinois, 462 eggs; Pen 1, S. C. White Leghorns, Pennsylvania, 452 eggs; Pen 43, White Orpingtons, Wisconsin, 448 eggs; Pen 3, S. C. White Leghorns, Pensylvania, 422 eggs; Pen 19, S. C. White Leghorns, England, 418 eggs; Pen 29, Black Leghorns, Georgia, 402 eggs; Pen 63, Barred Plymouth Rocks, Iowa, 389 eggs; Pen 64, Barred Plymouth Rocks, Michigan, 385 eggs; Pen 5, S. C. White Leghorns, Illinois, 383 eggs.

Of the five highest pens for April two are Plymouth Rocks, two are Leghorns, and one is White Minorca. They are as follows:

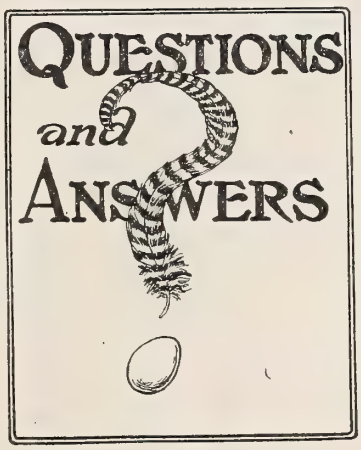
Pen 64, Barred Plymouth Rocks, Michigan, 124 eggs; Pen 21, S. C. White Leghorns, England, 120 eggs; Pen 24, S. C. White Minorcas, New York, 120 eggs; Pen 8, S. C. White Leghorns, Kentucky, 118 eggs; Pen 63, Barred Plymouth Rock, Iowa, 118 eggs.

The five highest hens for six months are as follows:

Pen 43, hen 277, White Orpington, Wisconsin, 138 eggs; Pen 67, hen 412 Barred Rocks, Illinois, 134 eggs; Pen 21, hen 129, S. C. White Leghorn, England, 117 eggs; Pen 75, hen 473, Rhode Island White, Illinois, 112 eggs; Pen 1, hen 2, S. C. White Leghorn, Pennsylvania, 103 eggs.

The total number of eggs laid for the month was 6,639 eggs.

Pen 64, Barred Plymouth Rocks, Michigan, won the cup for April by laying 124 eggs.



QUESTIONS AND ANSWERS.

In this department we will answer questions, pertaining to poultry. It is for the free use of our subscribers. When special information in regard to diseases, etc. is desired, same will be funished by mail to avoid delay. Ask your questions, let us help you.

Marion, Pa.

I have been having trouble with my chickens eating feathers by pulling them out at the neck. All efforts to stop this have failed. I feed a good mash, also get plenty of meat, as well as green food, such as sprouted oats and green grass.

Hoping that you can give me a remedy through "Everybodys" Poultry Magazine, I am, J. P.

Feather Eating—This is generally caused by too close confinement, improper feeding and often by insect pests. Fowls kept in close confinement and not having sufficient exercise and for the want of proper green food are liable to form all sorts of habits. We have known fowls to pick feathers from themselves. We would suggest that you provide your birds with more employment, scattering their feed among plenty of litter so as to give them plenty of exercise, also supply green food as you may have it. When feeding birds soft food add a small quantity of table salt and at every other day, add a little flowers of surphur.

New Danville, Pa.

Can you prescribe a remedy for my flock of chicks which is suffering from diarrhea? When the chicks are about from 2½ to 4 weeks old, they do not eat very much, especially in the morning and then they commence to die off. They are receiving good, wholesome feed,; have different kinds of girt before them at all times. We give them greed feed and keep their pens clean. We have a good warm house and the best of brooders. They have no lice as we have carefully examined them. Hoping to hear from you soon, I am, A. B. T.

Diarrhea—The symtons are defined as watery droppings due to sudden changes of diet generally or to climatic conditions. It is caused by some irritation of the digestive system. It may be the result of any disease. If it is supposed to be due to any specific disease, then adopt treatment specified for that disease. If taken early, diarrhea can be checked by reducing the amount of green animal feed and putting fowl on dry feed, eliminating moist mash. Give a tablespoonful of some (olive) oil as a laxative to carry off any irritating matters that may be in the intestines. In severe cases give from five to ten drops of laudanum to each bird. We have used the King Remedy Company's charc-oil with success. Address them at 21 Elm Street, Rochester, N. Y., and mention "Everbodys."

York, Pa.

What can I do to prevent combs from getting pale, or restore pale combs to their natural color?

C. S. K.

Without further symtons it is hard to tell the cause of the above. It may be the liver and it may be vitality, and it also may be the heart. Sometimes the circulation is difficient We would suggest some liver pills and also a heart stimulant. 1-60 grain of strychnine bills. Give one half a pill three times a day.

Germantown, N. C.

I have some pure bred White Orpingtons running on the range of my farm and are not properly mated. As I wish to mate them I would like to know how long I should wait in order to be sure of pure bred eggs? These hens are now laying. How long will a hen remain fertilized?

Would advise you to select and mate your birds. Leave them in this condition for at least ten days before setting any of their eggs. As a rule two weeks would be better. This greatly depends upon the laying condition of the hens when mated. A hen will usually produce fertile eggs to the extent of the clutch. This varies greatly in different females. We have had fertile eggs from hens up to eighteen days after mating has began, but still we think it is an unusual case.

American Poultry ASSOCIATION.

E. B. Thompson. President,
S. T. Campbell, Secretary,
Mansfield, Ohio.

Below gives you the results of the balloting for officers who will pilot the affairs of the American Poultry Association during the ensuing year. We congratulate the members of this organization, which is in such a peculiar position to do wonders for the good of the poultry industry in having such able men to handle her affairs. Let us all put our shoulders to the wheel in making the organization stronger and bigger in every particular.

The balloting was as follows: President, E. E. Richards, 2,296; Vice President, A. A. Peters, 1,543; Vice President, Joseph Russell, 795; Secretary, S. T. Campbell, 2,150; Place of meeting, San Francisco, 1,653; Place of meeting, Detroit, 671; Time of meeting, August, 836; Time of meeting, November, 1,413.

Now that the place of meeting has been decided upon, let every one boost for San Francisco and endeavor to make this the largest attended meeting in the history of the Association. November will be a beautiful season of the year on the Pacific slope and with the thousands of visitors who will be there, great opportunities will be presented the visiting poultrymen.

AMERICA'S BEST LIGHT BRAHMAS.

Bred in line for the last twenty-six years and winners at all the leading shows.
Stock for sale. Eggs from eight grand matings. Settings one-half price after May 1st. Send for Mating List.

BALCH & BROWN,
Manchester, Conn.

Dutton's Niagara Strain of Rhode Island Reds.

Originated by carefully blending together.

Bean-Tuttle. R. C. Old Acres-Harrison, S. C.

93 Birds under ribbons at 6 Shows, in two years and winning many Specials. Have furnished winners for the largest shows.

Will have for sale again next fall S. C. & R. C. Cockerels and Pullets. Bred from my Blue ribbon winners.

E. M. Dutton, Newfane, N. Y.

Edwards' Orpingtons

Buff Black White Cuckoo

Eggs $2.00 per 15 (Except Cuckoos)
Stock for Sale.

No Catalog.
Correspondence a pleasure.

Dr. Geo. B. Edwards, :: Laceyville, Pa.

S. C. White Leghorns. Baby Chicks and Eggs.

Birds raised on 50 acres free range, selected for laying, vitality and size.
CHICKS $4 per 25, $14 per 100. We guarantee safe delivery all chicks properly hatched and healthy. Eggs $1.50 per 15, $7, per 100, 85 per cent fertility guaranteed.
Egg and Chick Circular free.

Bryan Poultry Farm (Route 1) Danielsville, Pa.

LONG'S ORPINGTONS.

Eggs for balance of season at $2 per 15. One-half the females in my breeding pens at $2, $3, $4 and $5 each. Worth from $5 to $25 each. A number of yearling males at $3 each and upward. Will make winning cock birds. Arrange with us for birds to win your fall fair.

E. M. LONG, Box E., Osceola, Ind.

NONPAREIL

Barred Plymouth Rocks

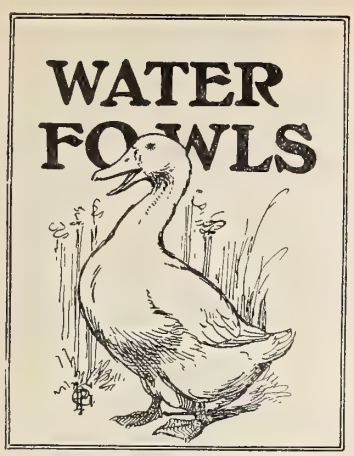
Line Bred Since 1883. Winners at Leading Shows, East and West, since 1885.

Hit the Trail to Successful Breeding by sending for our 1915 Mating List today. It fully describes the Matings, they are the best we've had and will produce results.

CHOICE SELECTED COCKERELS.

We have some beauties to offer you. Bred from our Best Lines, they have double worth. Mated Trios and Pens a specialty. Write us your wants today. We guarantee to sell you value that will produce results.

Schwab Bros., Box E, Irondequoit, N. Y.



THE RUNNER DUCKS

By Mrs. Geo. W. Church.

Q. What is the best way to start with Runners when one's capital is limited?

A. It is cheapest to start with eggs, but one should always buy from a reliable breeder who will furnish them from birds especially mated to produce good breeders. Cheap eggs from haphazard matings will produce inferior stock which is dear at any price. An investiment in a $10 setting from really good birds will prove to be more profitable in the end than ten $1.00 settings from scrub stock.

Q. Do you feed green stuff to your layers when on range in summer?

A. Yes. A duck requires a certain amount of feed to fill her up until she is satisfied. It is best that a portion of this bulk should consist of greens rather than so much grain which causes the layers to become over-fat. We allow two parts greens to the layers.

Q. What is the best green feed for ducks? How prepared?

A. We prefer alfalfa and clover but when these are not available we use young corn stalks, oats, wheat, rye, beet tops, various weeds, such as pig weed, red root, etc. Also all kinds of vegetables, apples and pumpkins. There is really very few things that a duck will refuse to eat. These are all fed raw and should be cut or chopped fine enough so the duck can swallow them easily.

Q. How often, also what, should the layers be fed?

A. When yarded they should be fed three times daily. The egg yield will be greater if mash is fed morning and noon and whole grain at night. A good laying ration consists of 3 parts bran, 2 parts corn meal, 2 parts middlings, 2 parts green stuff, 1 part beef scrap and ¼ part grit. (Sand size of wheat is best.) Mix all together thoroughly dry, enough to last several days. Moisten only enough for one feed at a time. Never make it sloppy. Feed just what is cleaned up quickly and apparently satisfies the flock. Oyster shells and plenty of drinking water must be accessable at all times.

Q. When do you pick your ducks?

A. I do not pick them at all as it is no longer considered advisable to pick fowls intended for breeders. Some do pick them when the feathers are ripe at moulting time, but as a rule it is no longer practised.

Q. How many months in a year will a Runner lay?

A. If properly fed and cared for they will produce eggs every month in the year. My ducks do not cease entirely during the moult and when this is completed, lay better than hens during the fall when eggs are highest priced. From about December 15, to January 15, is the time of fewest eggs. This seems to be the period in which nature intended the Runner to rest. At this time, as the eggs are so short, we feed only twice daily, and make no effort to force laying as by so doing the eggs hatch much better in the spring.

Q. How long will the eggs keep and hatch well?

A. By experimenting, we find that when properly cared for they will hatch fairly well when kept five weeks although as a rule we seldom set or ship any over one week old. If they are to be kept for a time they should be placed in shallow receptacles so they can be turned every day without fail. Cover with cloth to prevent evaporation and keep in a cool place—not colder than 40 degrees nor warmer than 60 degrees. Those that are soiled should be carefully washed but not wiped.

Q. How many ducks may be mated to one drake?

A. If they are to be kept yarded, allow 6 or 7 ducks to one drake or 10 to 12 if on free range. When more than one drake is kept in a pen they must not be allowed to fight as, if they do, very few eggs will be fertile. When they will dwell in peace take out one or more and change them about by having part of them in the pen during the day and the others during the night.

Q. Which is the best variety of Runners and which are in the Standard?

A. All three varieties are now recognized by the Standard. Which is "best" is for the purchaser to decide. However, we will say in a general way that hundreds of people have been dis appointed with the Fawns and Whites because they laid so many green or tinted eggs. Some breeders claim now to have strains which lay only white eggs. I have written several and asked if they would guarantee all ducks hatched from their eggs to lay white eggs only. Some made an evasive reply while others ignored the question entirely, so because of this I have never given them a trial as I have no time for green egg layers.

I kept the whites for two years and found them to be good layers but as it increased my work to keep two varieties of Runners, I disposed of them as I had a much greater trade in the English Penciled variety. The true Englished Penciled bird of the Cumberland type has never laid other than a white egg hence breeders of them will guarantee eggs from them to produce layers of white eggs only. The Fawn and Whites "throw" many penciled birds which are green egg layers but there should not be confused with the pure English Cumberland white egg layer. Some strains of the new "Runners" lay green eggs but are fine in type and carriage.

ALWAYS MENTION
"EVERYBODYS"

Bean's Ideal
Columbian Rocks

Winners at America's greatest shows. Exhibition and utility stock at reasonable prices. Eggs in season at live and let live prices. My birds are strong in utility qualities. Guarantee satisfaction.

Farm Poultry is always good to read, particularly when the editor has something nice to say in regard to Everybodys. The April 15th issue of this representative poultry publication compliments us on our individuality and wishes us success in that we may hold to that same style of general make up, which will make us unique in poultry publications.

Commissioner Harriman, who will have general supervision of the horse, poultry and dog shows at the New York State Fair, is a son of the late E. H. Harriman, and at the present time is V. Pres. of the Union Pacific R. R. and a director in many of the largest corporations in the country. Mr. Harriman is a devout lover of the outdoor life and his influence will be felt for the good in all departments of live stock at the New York State Fair.

Do not slacken your efforts in regard to the watchful care of the young stock, during the coming hot days of Summer. Many a promising bird has failed to develop on account of neglect at this important time of its growth.

Many breeders, particularly the beginner, starts off in the Spring of the year full of energy and work, nothing being too much to do for the comfort of the chicks; but, as the hot days of Summer come ,fails to keep up the good work, making the good start count for nothing.

Often we hear the judge at the Poultry Show say, "A good bird should be a winner, but stopped somewhere". The "stopped somewhere" in this instance being when the exhibitor fell down in the rearing. Do not let this be the case with you.

An elegant idea, and one you might put in effect if your room is limited. Separate those chicks which show the greatest promise, giving them the benefit of your very best time and attention and if possible placing them where they will have greater room for growth, etc.

Mr. J. Harry Wolseiffer, in the May issue of Everybodys, brought out some forceful thoughts in his article, "Utility vs. Fancy", and the most forceful to our mind was his statement that "egg" production lies absolutely with the breeder".

It is all "tommy rot" that the exhibition fowl is bred only for fine feathers, as we believe if the facts could be gathered, that proof could be shown that it is our ideal standard bred specimen that is directly responsible for the heavy layers of to-day.

True, if the breeder thinks only of show requirements and mates his birds with nothing else in mind, other than how the off spring will look in the exhibition coop, egg producing qualities may not materialize. But stop, how many such breeders have we? The writer believes them to be few and far between.

We welcome news of National interest for this department of Everybodys, and whether you reside in the remotest part of this country, or in a Foreign Land, we will be pleased to hear from you pertaining to matters of mutual interest to our readers.

At the Nashville Meeting of the A. P. A. the impression left was that the 1915 meeting of that body should be held at San Francisco. If after careful deliberation this conclusion was considered best, we see no reason why any agitation should now be made against it.

True San Francisco is a long ways across the Continent, (this from an Easterners view point), yet now be reasonable. Is not Atlantic City just as far from the Pacific slope? "What is sauce for the Gander, is sauce for the Goose".

Now is the time for the manager of all our Fall Fairs and Winter Poultry Shows to become busy in perfecting their plans for the coming exhibitions. Those who have been through the mill know the hard work necessary for a successful exhibition. Get an early start. Make your work a system, which will avoid the confusion of the last days grind.

If the hundreds of letters and telegrams received at this office, complimentary to our April and May issues, are any indication of its popular reception, we are indeed gratified. We hope to merit the many kind words expressed and by our every effort, put out a Poultry Magazine par-excellant.

While the express companies contend that fancy poultry should be charged a higher rate than that charged for poultry shipped for market purposes, they never yet have explained to the writers satisfactory, why this rate should be a full rate higher than that charged for poultry being shipped for immediate consumption. We fail to see the justice of this overcharge as fancy poultry is usually cooped in such a manner as to require the least possible care and attention. There is reason in all things. Why not be more explicit?

With the parcel post to contend with, we wonder that the express companies are not more careful in taking care of a "sure thing". Many an exhibitor would be showing at a half dozen different exhibitions, were it not that the express companies demand two or three times the price of his entry fees to tansport his birds.

The Old Forge Poultry Farm, Spring Grove, Pa., Mr. Glatfelter, Prop. have just received a handsome Silver Loving Cup, won at the Missouri Egg Laying Contest, by their pen of S. C. Buff Orpingtons. The Old Forge pen having carried off the honors for the month of November layng the greatest number of eggs in this noted contest.

Mr. Glatfelter reports that he has over 1500 youngsters coming on with his full capacity of incubators still working. The Old Forge Buff Orpingtons are so well established as great egg producers that the demand has been steady for this line of stock. "No dull times on this plant". Orders are now being received for Fall delivery and Mr. Glatfelter predicts that this will be one of his very best seasons.

Ideal conditions are found on the Old Forge plant, all which has helped to make the fowls grown here produce to the limit, nothing is wanting in making this plant one of the finest poultry farms in the country.

Mr. H. H. Collier, in the A. P. J. surely hits the nail squarely on the head when he says some very pointed things regarding the indiscriminate signing of applications for judges licenses. Mr. Collier places the blame for the reason of incompetent judges on the shoulders of those men who are so free to recommend to the license committee of the A. P. A. applicants who are qualified and then hide behind some pretence or other when the applicant fails to make good. A judge who will sign the application of a man or woman, whom he does not really know to be thoroughly competent, is a detriment to the A. P. A. and should be tabooed by all those who have the interests of the fancy at heart.

How can we keep our judging at a high standard, when licenses are so easly secured. The A. P. A. could expend money in no more satisfactory way than in some manner institute a plan whereby every applicant would personally appear before this license committee and on their merits there shown, be given or refused a license.

The attention of our readers is directed to the advertisement of the Bourbon Remedy Company, of Lexington, Ky., which will be found on another page of this issue. For many years Bourbon Poultry Cure has been the leading poultry remedy used in the Famous Blue Grass section of Kentucky, the greatest blood-stock region of the world. This remedy is a liquid and it is said to be so effective that one drop will cure the worse case of gapes. The manufacturers offer to send enough to cure two-hundred chicks of gapes and a valuable poultry book, both FREE, upon receipt of 10 cents to help pay for postage and packing. Don't sit by and watch your brood decrease and your profits dwindle from gapes, but look up the advertisement and write for this free medicine and book.

The Cleveland Hatchery, 918 West Madison avenue., Cleveland, Ohio, have hatched during the season of 1915 nearly 400,000 baby chicks, thus showing that the demand on this well known hatchery becomes greater and greater. Surely there is a reason for this and to all who have dealt with the Cleveland Hatchery, this is apparent, in that they get absolutely quality chicks at prices within the reach of all. Write them today for catalog and at the same time mention Everybodys. J. T. H.

Mr. E. M. Mengel, Prop. of Mengels Poultry Yards, New Ringgold, Pa., offers some attractive breeders at remarkable low prices in R. C. White and Buff Orpingtons, S. C. Blue and R. C. R. I. Reds. Mr. Mengel is an experienced poultryman, has some extra choice stock and we do not hesitate to recommend him to our readers. In the near future Mr. Mengel will issue a catalog fully describing his line, and all those interested would do well to get in touch with him.

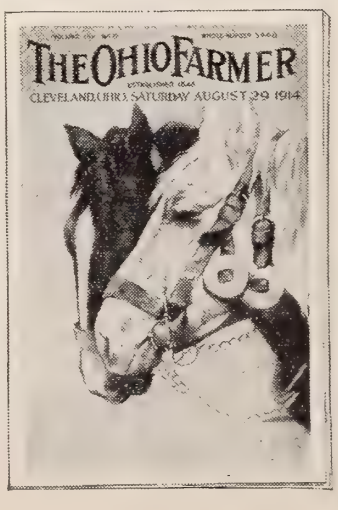
As a special offer, Mr. Mengel is offering choice breeders at $2.00 each, some having been used n his 1915 breeding pens. Write him to-day. J. T. H.

With Mr. W. H. Manning in charge of the Poultry Department at the Syracuse, New York State Fair, the fanciers and breeders can rest assured that the 1915 poultry exhibition will be managed and cared for to the best of the ability of Mr. Manning.

We are always pleased when such men as he are persuaded to handle our larger exhibitions, it not only assures greater and cleaner exhibitions, but adds prestige to the poultry industry.

Mr. Morris G. Temple, Pres. of the Penna. State Poultry Association was badly hurt during a heavy electric storm which struck West Chester, Pa., on April 27th. Mr. Temple was sitting on the porch of his residence at the time the storm came up and was rendered unconscious for a time. We trust ere this Mr. Temple has fully recovered and that no bad. results will follow.

We know of nothing which would be of more benefit to the fancy, in connection with the conducting of our poultry exhibitions, than that the A. P. A. would so empower the judges licensed by them, giving them sufficient authority



THE OHIO FARMER

A Magazine of Efficient Farming and Home Making.

Published for 65 years—The Ohio Farmer is of interest to Every member of the family, it teaches and practices progress, has labored for years for greater Efficiency in Farm Management. The Ohio Farmer and Everybodys

Both for One Year for 75c

Address

Everybodys Poultry Magazine

HANOVER, - - PA.

to settle on the spot all disputes over decisions, etc., which now under the existing conditions are referred to Board of Directors or some committee or other connected with the Poultry Show Management.

Did you ever stop to think how ridiculous a boxing match or horse race would be if the referee or judge called a meeting of some committee before a final decision could be made.

True it is that the race track has a higher tribunal than the judge, yet his decisions are usually upheld. And yet, if it were not that sufficient authority was given him, trouble would be had on every hand.

The true Fancier, the exhibitor who loves the sport, would welcome such authority to be vested in the judges whom the A. P. A. would only license where their ability and honesty were beyond question.

Mr. J. H. Drevenstedt in the American Fancier and Stock Keeper says. "As a rule no attention is paid by our judges at Comparison Shows to the scale of points, but rather typical shape and color are the real two aces in the deck of judges cards". We believe that when the judge has a clear and concise idea of typical shape and color, no one will regret that he is not the mathematician to carry in his memory the complicated scale of points as given in our Standard.

Along this line, would it not be well for the judge who does not wish to stretch the lining of his pockets, to cut the leaves of that part containing the scale of points, making them into a reference book over which he can burn the midnight oil, thus reducing the size of the volume and at the same time losing none of its value.

Mr. H. D. Swartz, P. O. Box 566, Scranton, Penna., is the inventor and manufacturer of a rat and mouse trap which has proven a great success in every particular.

So many rat traps on the market to-day are useless, that when one sees a good practical trap, they at once receive our attention.

This trap is simplicity itself, absolutely nothing to get out of order, and so reasonable in price that they are in the reach of all.

Almost every poultry plant at some time or other is bothered by either rats or mice. In the Universal Rat and Mouse catcher you have quick relief from these pests.

Mr. Swartz pays all transportaton charges and will send you circular describing this article by return mail. Write him to-day, mentioning Everybodys Poultry Magazine.

UHL HATCHERY.

New Washington, Ohio.

The Uhl Hatchery has for years furnished day-old chicks by the thousands and in almost every hamlet in the United States and Canada are found the "Uhl Brand" of poultry. At this present time they are turning out baby chicks at the rate of 30,000 a week and offering them at very attractive prices for June delivery. It is always a pleasure to recommend Uhl & Co., and their method of doing business. Here we have an established business, whieh year after year continued to hold the buying publics respect furnishing honest stock and always at prices within the reach of all. Write Uhl & Co., New Washington, Ohio, requesting that they mail you their catalog which will give you some conception of this great day-old-chick concern. Would be pleased to have you mention "Everybodys" in writnig.

WHATGLEN BLACK MINORCAS

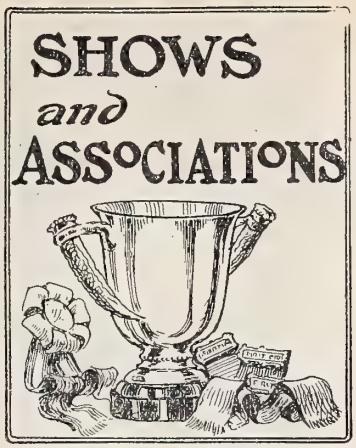
The catalog of the Whatglen Poultry Farm, Lancaster, Pa., owned by Mr. Frank McGrann and managed by Mr. Hiram Demmy, Jr., is one of the handsomest catalogues that has ever reached our desk. In this catalog is portrayed true to life pictures of the wonderful Black Minorcas, as bred by a man who understands the science of mating and raised under conditions ideal to produce the best.

In this catalog Mr. McGrann endeavors to give the readers a true description, not only of his line of winners, but a general description of his farm, illustrating this with beautiful drawings of the buildings thereon, as well as picturing some of the most notable winners at recent National Shows of merit, including the 1st. and 2nd. cockerel, 1st. and 2nd. pullet at Madison Square Garden, 1913, as well as other winners at this and other shows.

We have read this catalog from cover to cover and it inspires us to more and more confidence in the future of this grand and beautiful breed.

It is a pleasure for the writer to recommend the Whatglen Black Minorcas for back of this we have a knowledge of the merits not only of the line, but also a personal knowledge of them and who has brought them to the present high standard as found on the Whatglen Farm.

Write Mr. McGrann, Box E., Lancaster, Pa., if you are interested in the better quality of Black Minorcas and you will find that it will be a pleasure to do business with him. J. T. H.



Missouri State Show.

The 23rd annual exhibition of the Missouri State Poultry Association will be held in Joplin Mo., December 7-11th, 1915.

The following judges will place the awards: V. O. Hobbs, E. C. Branch, Thos. W. Southard, C. A. Emry, C. H. Rhodes, H. E. Pickett, W. H. Card.

Competition is open to the world.

The Missouri State Show is classed as one of the leading shows of the United States, and the show this year should be one of the largest and best ever held by the Associaton. A splendid program for the week of the show is being prepared and there will be many special features this year.

For further information, please address Fred Crosby, Secretary, Mountain Grove, Mo.

The result of the balloting for officers of the National Single Comb Buff Leghorn Club for the ensuing year was as follows:

President. Frank Broughton, Syracuse, N. Y.; Eastern Vice President, George Mair, Clifton, N. J. Middle Vice President, George H. Schmitz, Park Ridge, Ill.; Southern Vice President, J. O. Mahoney, Dallas, Texas; Western Vice President, Mrs. Albert H. Larson, Goble, Oregon; Secretary, Thomas Peer, Caldwell, N. J.; Executive Committee: C. Blyth, Toronto, Canada; Harry Hawkins, Chester, N. J; L. E. Merihew, Marathon, N. Y.

Secretary Henry D. Riley, of the American Plymouth Rock Club, writes us that the 1915 catalog is ready for mailing and urges that every member send in their yearly dues at once, thus assuring themselves of this catalog.

The club is fortunate in having a man of Mr. Riley's ability as secretary and particularly so, when the amount of work which Mr. Riley is doing is taken into consideration. We trust that every member will give the club their staunchest support, thus showing their appreciation of a real live secretary.

The Columbian Rock Bulletin for March is indeed an interesting publication and whether you are a breeder of this variety or not, you cannot help but want to know more about them.

In additon to the reports of the secretary, the bulletin contains some elegant articles on the Columbian Rock, also a Line Breeding Chart, prepared by Mr. T. J. Enslin, Hackettstown, N. J.

These, with up-to-date contributions by the Editor, Mr. C. R. Deardorff, North Judson, Ind., make it one of the best written and prepared bulletins we have ever received.

Wth such a determination to push the breed and with a club so active, the Columbian Rocks will increase in popular favor and well they should.

It is more than likely that the executive committee of the American Barred Plymouth Rock club will decide to hold the next annual meeting at San Francisco, in connection with the A. P. A. meeting and during the time of the Poultry Exhibition. This was discussed at the Pittsburg meeting and the concensus of opinion was that here was an opportunity to awaken new interest among the "Barred fanciers on the Pacific slope and near states. In addition, many of our fanciers will desire to visit the Exposition, also attend the A. P. A. meetings. Taking it all in all, we think San Francisco is the logical meeting place this year.

The Poultry Departments of the Fairs, making up the Pen-Mar circuit, which include Hanover, Carlisle, Lancaster, York in Pennsylvania and Hagerstown and Frederick in Maryland are becoming active in preparation for the events this fall. This circuit includes one of the richest poultry sections in the country and the fanciers are of an advanced type. We attribute this greatly for the success of the poultry exhibitions in connection with these Fairs.

Rochester, N. Y. Association.

At the April 6th meeting of the Flower City Poultry and Pigeon Association, Inc. The first copy of Everybodys Poultry Magazine was exhibited. It received a cordial greeting. The consensus of opinion was best expressed by every member present subscribing for it. Everybodys wth its broad views and complete reports fills a long felt want.

J. W. CHAPMAN, Secretary.

OKLAHOMA STATE FEDERATION SHOW.

The Executive Board of the Oklahoma State Poultry Federation took a long stride in the right direction when they selected Stillwater, Oklahoma, as the place for holding the 1916 show. The connection with the Farmers Short Course, that is to be made an educational feature for the purpose of interesting the farmers in more and better poultry and especially in Pure Bred Poultry.

The judges of this show have been selected and they are men of national reputation. Judge Thomas Wood, of Fayette, Missouri, is one of them, and W. H. Card, of Manchester, Connecticut, is the other, and Hon. J. Howard Sledd, of Mounds, Oklahoma, has been selected as the superintendent. The reputation of these men for honesty and square dealing should make every exhibitor feel sure that he is going to get a square deal and that his birds are going to be judged for what they are absolutely worth.

J. M. Springer of Stillwater, Oklahoma, president of the Payne County Branch of the Oklahoma State Poultry Federation, and Professor B. A. Ahrens, of the Agricultural and Mechanical College, who is secretary of the Payne Poultry Federation, are to be congratulated upon their selection of judges and superintendent.

AT CHATTANOOGA, TENN.

The American Poultry Association will hold an educational institute in connection with the 1915 Chattanooga Poultry Association and will offer gold and silver medals and diplomas at the show to be held next December. This recognition of the Chattanooga poultry show as a representative show of the south will be an incentive to exhibitors throughout the country to send their birds to Chattanooga. This show has yearly been improved in size and quality and it is anticipated that the next show will be the best ever. Chattanooga scenically and historically is one of the most interesting cities in the country to visit; is well located with excellent transportation facilities and has a large territory from which to draw.

At the annual meeting of the Chattanooga Poultry Association, held in January, the following officers were elected: President, O. B. Andrews; 1st Vice-President, D. S. Henry; 2nd Vice-President, T. M. Marett; Secretary-treasurer F. C. Rose; Assistant Secretary, Wade H. Farrar; Superintendent, W. A. Luther.

Partridge Wyandotte Club Secretary.

At the recent annual election of the National Partridge Wyandotte Club. Mr. John F. Tallinger, Box 114, Barnard, N. Y., was elected Secretary and Treasurer. Confidence is expressed that in this fanciers hands, the club will now take on new life and become a club worthy of the handsome and most exellent variety it represents.

THE AMERICAN LIGHT BRAHMA CLUB.

Catalogue for 1915.

Breeders, and particularly beginners, in poultry breeding should send for copy of the 1915 catalogue of the Light Brahma Club. It is an instructive and valuable book, with specially good articles relating to this worthy breed. Address Mr. H. C. Wood, Secretary, Bound Brook, N. J.

"THE AMERICAN CORNISH CLUB".
May 1st, 1915, 291 paid up members
The "Club with a Punch".

The American Cornish Club Annual for 1915 is the sensation of specialty club year books for this year.

Showing a growth in membership that has more than doubled itself during the past year, a paid up to February 1st, 1916 membership, mind you, it truly can be called a sensation.

And the American Cornish Club is still growing. Think of it, 84 new members since Januar 1st, 1915 and they are still coming. 22 in January 20 in February, 28 in March and 12 in April. Some growth for an infant. A mighty lusty youngster we would call it.

Then there are others things of interest. The executive board has sent the 1915 club meeting to San Francisco in November, thereby setting aside all selfish desires and giving the California boys something that is due them, for the far Western membership of the American Cornish Club is strong and loyal to the club. They have a "get a member" contest with valuable prizes, a "Health and Disease Department" and other features.

We cannot close without mention of the articles. They are all good, every one of them and alone worth the price of subscription to the club which is only $1.00 per year. Or if you do not care to join the club the Annual is only 50 cents.

Better have one even if you are not a Cornish breeder. The 1915 American Cornish Club Annual is full of interest to everyone.

Write the Secretary today, addressing, John W. Ward, Jr. Pennington, N. J.

The Kansas City Poultry Show will be held at the large Convention Hall, Kansas City, Missouri, January 10 to 15, 1916. The following well known judges will place the awards: V. O. Hobbs, Russell F. Palmer. Wm. C. Tallant, Tom Cochran and A. J. Meyer. For any information desired, address the secretary, Mr. E. L. Noyes, Manhattan Building, Kansas City Mo.

We are in receipt of the year book for 1915 of the American Light Brahma Club and we find it full of good things from cover to cover. Illustrated with cuts of the officers, as well as many illustrations of this grand old variety. Every breeder of Light Brahmas should join this club, thus obtaining the year book. Look up our classified columns and under heading of Brahmas, you will find the name and address of Club Secretary.

We are in receipt of the year-book of the American Houdan Club, and we wish to compliment Mr. N. L. Deming, the retiring Secretary, on the concise form in which he presents the work of the Club during the past year. The year-book is full of good things for the lover of this most excellent variety, and should be in the hands of every Houdan breeder.

Another year-book, which, while the first one issued by the Rose Comb Orpington Club, is a great credit to the Club. We like the tone of the messages included from their President, Mr. H. C. Falkner and the Secretary-Treasurer, Mr. E. M. Mengel, New Ringgold, Pa.

The members of the Huntington Poultry, Pigeon and Pet Stock Association who met on April 16, 1915, started preliminary arrangements for their Eighth Annual show to be held in Huntington, Indiana, on January 18th to 22nd inclusive, 1916, and selected Judge Thos. S. Falkner, of Tiffin, Ohio, to place the awards. This show will be judged by the comparison system of judging and the premiums to be given will consist of 25 per cent of entry fees to first prize winners, 15 per cent of entry fees to second prize winners and 10 per cent of entry fees to third prize winners, also numerous silver cups and merchandise specials.

The January 1915 show did not contain quite so many specimens as some of the former shows, but the quality was very much the average.

This association has also decided to issue a lithographed certificate of the winning of each exhibitor in each variety at the 1916 show, instead of giving the usual ribbons as heretofore. This will not only be a saving to the association financially, but will assemble all of an exhibitors winnings together, over the signature of the president of the association, the superintendent of the show and the judge placing the award.

Try The "BUCKEYE"
40 days trial with absolute guarantee to hatch every hatchable egg. 1100 dealers. Low as $7.50 anywhere east of the Rockies and North of Texas. Slightly higher in the west. Six sizes 60 to 600 eggs. Write for big catalog and dealer's name.

The above cut shows the 1st prize White Wyandotte cock at the Grand Central Palace Show, N. Y., Dec., 1914. This male is indeed a beautiful specimen of the Wyandotte and has produced some extraordinary birds. Note the type, etc. Mr. F. B. Williams, Prop. of the West Mountain Poultry Yards, Naugatuck, Conn. has made an enviable record during the past show season.

THE EGG EATING HABIT.

By Dr. George B. Edward.

How best to cure, the cause is more easy to define and avoid than a cure.

This is a habit so vicious and common to hens that it may not be out of place to speak of it in this issue of Everybody's. Few poultry keepers but know what it means to battle with it, especially after it has become incurable among a lot of refractory, yet good laying hens. For there seems to be no condition among the chicken kind that so closely approaches "demon possession" as when this habit gets final and complete control.

The cause is more easy to define than a cure. And a little prevention is worth more than a good deal of cure. In the first place, most laying hens are always ready to appropriate to themselves everything that goes to make up an egg. This being a a natural instinct, and a proper demand from a normal egg-manufacturing process going on in every productive female. A thin shelled egg, having become broken in the nest or on the floor, may be the exciting cause of this habit. And when such a thing occurs, one should immediately become seriously watchful. There is usually a leader among the hens in this degrading enterprise, and one of two things may be suggested as the best thing to do. Either kill the leader with death, which implies separation from the flock or complete reduction by the hatchet. Or, get after the hen that laid the thin shelled egg. If she has not been sufficiently supplied with lime, see that she gets it. Then, if there is no improvement, and she is a valuable bird and has been doing heavy laying, separate her from the others, and allow her to stop laying. A rest of a week or so may bring her around all right, but, if she still persists in laying very thin shelled eggs, I would not risk her again among the other layers.

Some hens for some reason do not seek a nest when they lay, but will drop their eggs on the floor. And while this is objectionable, no harm is apt to come from it, provided the egg shells are sufficiently hard and thick as not to break. For the hens do not seem to pay much attention to them, except they become broken. Yet it may be well, if you can find the hen guilty of this, to remove her from the others, or endeavor to teach her what a nest was made for.

It often happens that a whole flock of layers that have become thoroughly possessed with this habit, are beyond remedy, and either must be sent to market, or, if they are valuable, to try the following course. Feed them so sparingly that they will cease laying altogether, remove them to other quarters, and in process of time, when they begin laying again, they will have reformed, not because they wanted to, but because they had forgotten the old habit.

Many remedies have been suggested to correct the practice. Dark, out-of-the-way nests may bring relief. Egg shells filled with a paste of mustard and pepper, and thrown on the floor, may afford a great deal of fun, but has never worked a cure in our hands. And yet, we have known of cases where egg shells alone have been broken up and thrown to the hens in great abundance, and this has brought about happy results.

And this leads us to remark that the most common cause for egg eating is a lack of shell forming material. Only recently, in one of our own pens, we discovered an egg had been eaten in the nest, and that several hens were hanging 'round to see if any more eggs were ready for them to devour. The first thing we did was to make sure that a supply of oyster shell was on hand in reach of the birds. Investigation revealed, however, that the shell box was entirely empty, and perhaps had been so for several days. First act was to bring some shells as quickly as possible, which were devoured as though life depended upon it. Then we cleaned out the nest and replaced old material with some clean, bright excelsior. Happily, there was no more trouble.

Here, as ever, "a Stitch in time saves nine." Be watchful, therefore, dear reader, against this habit, and dread it as you would dread poison. The frequent causes of it are these. Hens crowded in too close quarters without enough to do. Lack of shell forming material always before the birds. And nest built on a level with the floor, so that the hens have too easy access to them. We believe firmly, if the habit is watched against by prevention along the lines indicated very little trouble will be experienced in extreme cases where only "to kill is to cure."

Our Bird Neighbors.

RAISING CANARIES FOR PIN-MONEY.

Europe's Great World-War Gives Rise to Fascinating Pastime For Old and Young.

By Felix J. Koch.

Fascinating?

Well, if you can imagine more fascinating than watching a dear, little yellow mother-bird, doing her best to correct the well-meant attentions of a father-bird, to her nest, and, at the same time, make things ship-shape with the cotton you've put in the cage bottom; and, still again, all at the same time, be keeping a weather-eye that you, and all other big giant humans, don't come too close, we should like to hear of the same!

Then, too, it's profitable, young canaries always bring good prices, but especially now, with Europe's great world-war not alone cutting off the supply of canaries to export, but disorganizing the raising of the birds over there, the canaries are jumping in price day by day. Nor is the raising of canaries in the home, the camp, the office even, difficult.

A breeding-cage costs only a few dollars, it will be paid for in good time, by the young birds. You've your own canary to start with, and fifty cents will buy a little female, for these only warble, rather than sing, they do not command so high a price. For fifteen cents you can get a little nest at the bird-store, or you can make such yourself out of down, and the birds will do the rest.

By and by you've the little blue eggs, then all the joy and expectancy, and by and by the baby birds.

Of course you bring in the neighbors; they all want one as soon as possible and Jack Roosa will tell you that these home-bred canaries bring quite as good prices as their sires, from the bird-stores in town. Now that the war is reducing the supplies of these bird-stores, this is especially true.

Chances are it has never occurred to you to wonder, heretofore just where that delightful little singer of your's came from, before you secured him from that bird-store. He, or one of his very near ancestors, the chances are, came from just one of the world-war lands.

Many, if not most of these birds, come, now, from Thuringia, where the peasants raise them in great flocks, as they would so many pigeons. Imagine seeing five hundred, a thousand, little canary birds settling down, like a yellow snow-storm, to feed and then to sing. With the world war taking the men, the boys even, away to battle, the birds have their care takers gone, the women can only look after them in part, for the women have the old accustomed duties to do as well, and so the poor birds suffer neglect, or fly off and away, from their accustomed haunts and the supply will fall short indeed.

The canary, students of the bird relate, has always been a favorite cage bird, not only on account of the beauty of its plumage and the excellence of its song, but also for its docility, affectionate disposition and readiness with which it broods in confinement.

Another source of gratification connected with this bird is the observation of its peculiarities of disposition. Some are melancholy, others lively, some of a peaceful, other of a quarrelsome disposition; some docile, others stupid; some eager to pair, others delighting in solitude.

Their chief recommendation, however, says one naturalist, "consists, beyond doubt, in their loud, lively and various song, which is continued throughout the year, in some cases, even in the moulting season. Some, which are very much esteemed, will sing even at night, if a light be placed near their cage, a peculiarity, which, though natural in some, is in most cases the result of long training.

Buffon, you recollect, contrasts the canary and the nightingale as follows: 'If the latter is the enchantress of the woods, the former is the musician of the chamber. The first owes all to nature; the second derives something from our arts. With less strength of organ, less compass of voice, and less variety of note, the canary bird has a better ear, greater facility of imitation, and more memory, and, as the difference of genius, especially among the lower animals, depends in a great measure on the difference that exists among them with regard to the perfection of their senses, the canary bird, whose organ of hearing is more attentive and more susceptible of receiving and retaining foreign impressions, becomes, accordingly, more social, tamer and more familiar. It is capable of gratitude and even of attachment, its caresses and endearing, its little humors are innocent, and its anger neither hurts nor offends.

"Its education is easy; we rear it with pleasure, because we are able to instruct it, it leaves the melody of its natural note to listen to the harmony of our voices and instruments, it applauds, it acompanies us and repays the pleasure it receives with interest. The nightingale, more proud of its talent, seems willing to preserve it in all its purity, at least it appears very little to value ours, and it is with the greatest difficulty that it can be taught to repeat any of our airs.

"The canary can speak and whistle, the nightingale despises our words as well as our song and never fails to return to the warbling of its own wildwood notes. Its pipe is a masterpiece of nature, which human art can neither alter nor improve, that of the canary bird is a model of more pliant materials, which we can mould at pleasure."

Long before even Buffon's time, the world had come to much the same conclusions as to the canary bird, and took it to its home as a pet. So the breeding of the birds became a recognized industry, first, in the Canary Islands the old ancestral home of the race, then in Germany, in Thuringia, and in England, where societies have been organized to study the birds with a view to increasing their song and other endearing qualities.

But England and Germany from whence most of the birds are exported, are now too busy with warfare to give much time to the little songsters, with a result that we will witness a death in canaries shortly, such as the world has not experienced in a long time before.

VOICE OF THE PEOPLE.

This department is for all matters of interest. Our readers are requested to send us such items of value and interest, also comments on questions of the day. All join in and make this a live proposition.

TODAY.

Sure,this world is full of trouble—
I ain't said it ain't
Lord! I've had enough an' trouble
Reason for complaint.
Rain an' storm have come to fret me,
Skies were often gray;
Thorns an' brambles have beset me
On the road—but say
Ain't it fine today!

What's the use of always weepin',
Making trouble last?
What's the use of always keepin'
Thinkin' of the past?
Each must have tribulation,
Water with his wine,
Life it ain't no celebration.
Trouble? I've had mine—
But today is fine.

It's today that I am livin'
Not a month ago,
As time wills it so.
Yesterday a cloud of sorrow
Fell across the way;
It may rain again tomorrow,
It may rain—but, say
Ain't it fine today!

Salt Water For Handerchiefs.

Colored handkerchiefs should be soaked in cold salt water for a short time before they are washed. This will prevent the colors from running or fading.

For Stained Fingers

Vegetable and fruit stains on the fingers can be removed by dipping in very strong tea for a few minutes and then washing in warm water.

A Remedy for Moist Hands.

A good remedy for clammy, moist hands is bathing them in a lotion consisting of one-fourth ounce of powdered alum and one teaspoonful of spirits of ammonia in a pint of boiling water.

To Make Paper Transparent.

To chemically cause paper to become transparent, says the Scientific American, use the following solution on the paper: White wax, two ounces; ether, one ounce. The solution will be muddy at first, but after a few minutes pour off the clear solution, which is the one to save and use.

CLEAN UP.

There's no time like today
To throw the cans away
And haul the ashes from the lot
And polish up the home you've got.
You'll find that it will pay
Get up at early dawn
And get the weeds all drawn
And from the alley to the street
Clean up your place and make it neat
And manicure the lawn
The microbes all grow lean
In places, that are clean
They cannot thrive when you have done
Your duty. They will cut and run
And never more be seen
"Clean up." for that's the cry.
Allow no refuse nigh
So get the rakes and brooms all down
And chase the germs all out of town.
You'll do it, if you try.

Explicit.

Lawyer (to timid young woman): Have you ever appeared as witness in a suit before?

Young Woman (blushing): Y-es, sir, of course.

Young Woman (with more confidence): It was a nun's veiling, shirred down the front and trimmed with a lovely blue, and hat to match.

Judge (rapping violently): Order in the court!

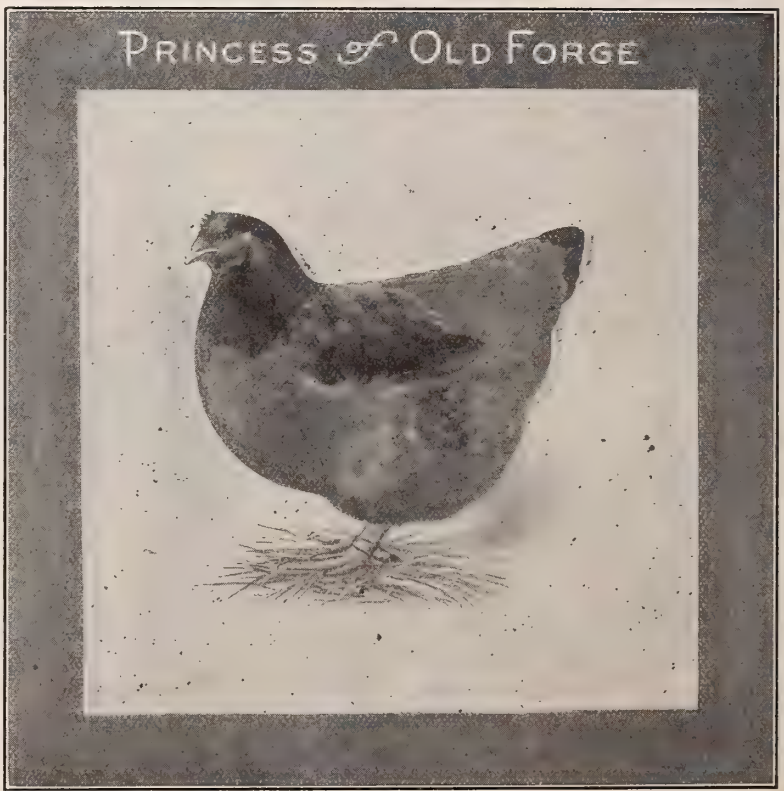
ALWAYS MENTION "EVERYBODYS"



The above picture shows one of the remarkable S. C. Buff Orpington record laying females, as produced at the Old Forge Buff Orpington Farm, Spring Grove, Pa. This pullet "Princess of Old Forge" laid 229 eggs in her pullet year. Note her type, which is characteristic of the Old Forge line. J. T. H.

GUINEA FOWL.

By Sarah A. Little.

So many inquiries come to me in regard to rearing Guinea fowl that I imagine that they prove a puzzle to many people. I have found them very easy to raise and I believe the secret of my success is that I hatch and brood them with hens.

I locate the Guinea's nest as soon after she begins to lay as possible. As a rule, in this section, the tenth day of May is the average day for the first egg. Finding the Guinea's nest often requires some patience. She rarely goes to her nest before ten in the morning and she is rarely found on it so late as two in the afternoon until she becomes broody. If disturbed while on the nest, and also a short time before she leaves it, she makes a peculiar cry, a succession of Guiena sounds, followed by her distinction cry of "Buckwheat, Buckwheat." She uses this combination of cries at no time except in connection with her nest, so it may usually be located by it. If not successful the first day, "try, try again." If found, go away quietly, and do not disturb the nest until she has rejoined the flock, then take out all the eggs, replacing carefully with an equal number of infertile eggs, from the incubator, which have been previously boiled and marked with an indelible pencil. As soon as fifteen eggs have been collected, put them under a quiet hen. Keep the hen comfortable and well fed, free from vermin of course, and guarded against disturbance.

On the twenty-sixth day of incubation, after she has been fed and cared for, close the nest with fine screen so she may have abundant air, but so that should a chick hatch prematurely, it cannot get far from the hen. Twenty-eight days is the usual period of incubation, but there is now and then a chick which is so precious that he cannot wait for his small relatives, but must needs hasten matters and unless he is restrained, he may come to grief. Such birds are best removed to a warm box, near the stove, and when the nest full is hatched, he may be given a sip of water, a few bread crumbs and be returned to the nest.

When removing the hatch from the nest, the hen should be placed where she cannot hear the chicks, dusted with a mild insect powder, fed generously, given water and left for half an hour or more of rest, before her brood is given to her.

The coop should be large and roomy and in high ground and the chicks should be confined closely with their mother for a day or two, as they do not know hen language, then liberate them in a small wire run in a day or two more. When they learn her call which will be in about a week's time, they, with the hen, may be liberated, but they must be watched for a while to see that they do not get lost from the hen. They will cry so hard if lost that there is no danger of their not being heard. The cry of the chicks can hardly be distinguished from that of young ducks. The brood should always find bread crumbs, wheat, cracked corn, rolled oats or commercial chick feed in their coop when they return to it, so that it will be easy to shut them in before nightfall. Chick grit and water should also be found at the coop. Guinea fowl are my thirsty birds.

The Guinea hen is a most exemplary incubator, hatching a chick for nearly every egg entrusted to her, but as a brooder she leaves much to be desired. If the weather is warm and dry when she hatches, all is well, but if cold and wet, she roams too much for such small birdies and she does not cover them enough. Many get hopelessly wet and chilled and perish from lack of "mothering." Only the strong ones survive. There is but little help which one can give a Guinea hen in rearing her flock. She resents interference with them and prefers to have her own way. The hardiest will survive her treatment and one may be assured that what remain in the flock will be the hardiest and most vigorous of the hatch. In three or four weeks, the little fellows will have developed such strong big wings that they find their way into the trees with their mother. I once had a flock go into a tree to roost at twenty-three days from hatching time. When reared by a gentle hen, they become very tame, though they do not really like to be caught. They cluster around ones feet at feeding time and show little if any fear.

The eggs are small, round at one end and pointed at the other. Shaped a little like a turkey egg and dotted with brown spots on a lighter colored ground. The shells are very hard and they do not deteriorate nearly so rapidly as do hens eggs. They are excellent for the table, broiled, fried or as a small roast the flesh of Guineas is delicious. It has been prized as food since the days of ancient Rome. The dressed carcass is not attractive in appearance, as it is dark, almost purple in some parts. As food they resemble game birds more than domestic fowls.

After one becomes accustomed to the "tricks" and manners of Guinea fowl, they will be found very interesting. The surest way to distinguish their sex is by their cries. The female has a smaller head than the male and the head ornaments are less conspicious. Her frequent reiteration of the word "Buckwheat," rendered as distinctly as one could say it oneself, marks her sex as the male never imitates this cry. The male has a courser head and the wattles are often quite large. He has a funny little mimicing strut, at times dancing on the tips of his toes, which the hen never attempts. His distinguishing cry is not so loud as that of the female, a wailing, complaining succession of notes which the hen never imitates. There is another cry common to both, a harsh, long continued chatter, which announces anger, fear or an alarm of possible danger. During the day this cry does not always mean real danger, but at night it is wise to heed the alarm and go to the rescue.

The Pearl Guinea is the best known and is probably the original type. An honest faithful little producer, a great insect destroyer and a bird which does little damage to crops. The White African variety is exceedingly beautiful, when clean, but unfortunately it "shows dirt." The Lannder is a faded, washed out Pearl, decended from crosses between the Pearl and the White and not nearly so pretty as either of the other varieties. I have seen other colorings at large shows, but so few of them are exhibited that one doubts their being established varieties.

$1,569.89 on a Town Lot

Here is a human interest story of how Mr. Carter made this real money with Buffalo Equipment. Everyone interested in making money out of poultry should ask for our March circular and catalogue of Buffalo Incubators and Brooders.

EVERYBODY'S CHATS.

Continued from Page 203.

The Barred Rock Club catalogue is in print and will be mailed to the members this month. We are promised a very good book filled with good things to know about this variety. Breeders should join the club and receive a copy free. Address Mr. H. D. Riley, Secretary, Strafford, Conn.

Husband—I hope I have made myself plain.

Wife—That was entirely unnecessary. Nature did it for you.

Wonder how many of our readers are interested in Game Fowls? We have some valuable matter relating to these.

We wish the secretary of every Poultry Association and of every Poultry Club to write with complete information, list of officers and members so we may have correct addresses, etc., for publication and for reference.We also have other purposes in view and hope to receive this information in the near future.

Let me specially refer you to the article in this issue by Professor H. R. Lewis, this should be of interest to many of our readers. Mr. Lewis has given us some of the best copy ever written; it is practical, reliable and seasonable. We have the promise of more from him in regular monthly instalments in which he will cover the entire field of poultry breeding. Keep your copies of "Everybodys" you will want them for future reference.

We also point with special pride to the work of others, including Mr. Charles D. Cleveland, Louis P. Graham, J. Harry Wolseiffer, Mrs. Irving F. Rice and Messrs. Punderford, Boyer, Tormohlen and others. Every article we publish is well worth the price of a year's subscription to anyone. Tell your friends of this.

Something for Everybody in "Everybodys."

The Light Brahma Club with Mr. Harvey Wood, Bound Brook, N. J., as secretary has become to be one of the big speciality clubs of the country. While Mr. Wood deserves special credit for the showing this club and this variety has made the past few years, there are also others who have done their part nobly and with credit.

The advantage this club has had is found in their breed. The Light Brahma assures results to the breeder. The man who wishes to make money in poultry, need look no further for a variety that will insure results. This with their present demand which exceeds that of any former time bids well for their future.

There are new breeds and varieties that are sound and reliable, that with proper breeding and care will insure positive success. But "boys" there is something about some of the old varieties, which have weathered years of competition, that were established here before we came and among which we have grown up, that endears them to us. That something is not sentiment alone, it is their quality, their merit combined with majestic refinement in the Light Brahma.

"My doctor says I musn't worry," said Mr. Groutcher.

"Well, I'd get another doctor," replied his wife. "First he says you mustn't drink; then he says you mustn't smoke; now he says you mustn't worry. He don't let you do anything that you enjoy."

Man fainted while watching Paderewiski play the piano. Whether this is a knock or a boost for Ignace, the critics do not say.

Just as a parting word for this month—"BOOST EVERYBODYS."

PIGEON NOTES.

By A. Wake.

I have never before witnessed so much interest taken by the general public along the pigeon aisles at any show as was evident at the recent Garden Show.

The display of about 20 black Fairy Swallows on the main floor by the Mountainside Lofts, T. A. Havemeyer, Jr., Prop., was truly magnificent. Every one was of wonderful quality, the monstrous slippers of the proper shape and wave were par excellence, the shell crests reaching around to the eyes, the lustrous color, the straight lines of the white bars, the short cobby bodies, wide breasts and tapering, well folded flights and tails, made them look as though the limit of perfection had been reached, they were indeed models. My hat is off to you Mr. Havemeyer, for this grand achievement.

The hanging of the records, properly attested, on the pens in the Flying Homer Section attracted considerable attention and proved very interesting. Numerous 500 milers and several 600 milers were on view. What wonderful intelligence these birds have.

Throughout the week there were always someone to be noticed around the Carneaux, these fanciers certainly are intense and there are lots of good things to be seen in a first class Carneaux, notwithstanding the remark of some to the contrary. Get in the game and you'll soon find out.

The Judge who undertakes the job of placing the cards on the Oriental Frills must, at least for the present, have the faculty of balancing the good and bad qualities, for the instructions and adoption of the real thing was not forthcoming after the meeting of the Oriental Frill Club, which was practically adjourned to get together amongst the pens.

G. P. PILLING & SON CO.
23RD AND ARCH STREETS PHILADELPHIA, PA.

Several members put in the walking pen their favorite laced birds and after they were argued pro and con another dropped in a better headed and beaked one and asked what's the matter with this bird's head? And there you are. The one point man should never condescend to officiate in this variety.

On the question of one point judging, I have witnessed some work that actually was tainted with ignorance, lack of confidence, hence incompetency.

The nearest variety coming under the scope of one point, to my mind, is the Fantail, and there are lots of points on the Fan besides the tail. Size of body and action are very important yet I have heard some say, Oh! the tail, that's all. Again the head of the Long Faced Tumbler is all some can get by, passing up some with beautiful color and markings, as seen in the balds and mottles with right decent heads, for a freakish or accidental one. By the way some of the Tumblers nowadays seen winning, especially in the Black Selfs, are having their skulls shortened up that they are called by some "Bullet Headed" and rightfully so. Be careful you heavy importers the style may go back to a more oval headed type with a top skull that will jar you.

Turbits used to be wanted with big frontals and wide bulges, but now the low foreheads without the high top is the prevailing thing, provided the bumps are out and the nose is large and snug fitting.

African Owls hold their own very well in not changing the fashion, "as round as a marble" is the slogan and always was, but getting back to the one point idea, I have seen Turbits and Owls placed at the top only on account of their noses.

Quite a few fanciers from a distance were in attendance at the recent Garden Show, amongst whom I noticed C. H. Duffy, Topeka, Kansas; Christian Clusman and John Bauer, Baltimore; C. Wood Beachy, Cumberland, Md.; Massachusetts being represented by C. E. Twombley, Boston; Richard Whitney, Dorchester Centre; F. W. Gorse, Needham Heights; Walter Hersey, Wellesley Hills, and George Watson, Lowell, and President Austin and Secretary Ashley of the American Pigeon Club. Among the Pennsylvanians were Wm. M. Lynn, Frank Lee Mills, Geo. W. Unger, of Boyertown; Joel A. Arnold and John L. Ennis, of Reading, E. F. Baldwin, of Crafton; F. L. Altvater, Pittsburgh; Patchke ,of Altoona; Samuel Black and Isaac Brennaman, of Lebanon; and Messrs. Sweissfurth, Ehinger and Powell, of Philadelphia, and a host of others whom I do not recall, at present.

Mr. A. E. Robst, of Closter, N. J., will have charge of the Pigeon Section of the next Garden Show, New Year's week, Mr. Cleveland very wisely making him a dependent deputy to relieve him of much arduous work. I am sure he will be supported and with the assistance of the United Pigeon Fanciers' Club one may look for splendid results.

Supt. of Pigeons DeLong, of the Panama-Pacific Show is on the job with the right ring to it. He is after the Specialty Clubs red hot and is using the proper method. Some have already responded. His communications are to the point and spell "business" and "system". This Show will be held from Thursday, November 18 to Sunday, November 28, 1915. Two California Pigeon Clubs have each voted $100.00 cash to be awarded as Specials.

Writing of models, I regret hearing of the death, last month, by poison of the wonderful 1913 Silver Turbit Cock, owned and bred by Mr. Jensen, probably the foremost breeder of Turbits in England. This pigeon was accepted by the English Turbit Club as faultless and of course was taken as a living model. The death of this cock and several others was caused by Mr. Jensen placing some poison in order to rid the loft of certain rodents. My sympathies are extended to him, not only on account of the extraordinary merits of this great Turbit, but also a financial loss as I have been advised that a 100 pound note was refused for him.

The Committee appointed by President Austin, of the American Pigeon Club, at its annual meeting held at Boston, to devise means and make recommendations for increasing the receipts and to offer inducements to secure a larger membership with instructions to report at a special meeting to be held at New York, failed to accomplish much. It is a most vexing question.

To my mind the usefulness of the Club is demonstrated by its control of the Conference Rings and also of the various Shows. Its constitution and by-laws give its officers the necessary authority to punish irregularities and these functions have been carried out in various instances.

Some think we should offer special diplomas for certain winners which I agree with. They have their value to the real fancier even though not expensive. Others would like to have more expensive trophies distributed which means more funds, and the only available source of securing these funds would be to increase the price of the rings and to combine the offices of Band Distributor and Sec'y-Treas., fixing a stated sum as a salary instead of the fee system as is now in vogue, but the idea of increasing the price of rings would be met with considerable opposition.

Approximately 55,000 rings are distributed, the present price being 55c per dozen. An increase of 5c per dozen would mean approximately $230.00.

On a basis of say 7 or 8 shows to enjoy patronage of the Club, with a grand total of 23 Special prizes of $10.00 each, apportioned to varieties based on certain characteristics and allotted as follows:—San Francisco 2, Chicago 2, Boston 6, New York 6, Philadelphia 3, Reading 2, Baltimore 2, confining competition to members paid up to a certain date only would probably be an incentive towards increasing the membership.

The would be authorities on the various rare varieties were stumped by a certain exhibit at New York, which was accompanied by a statement of the bird's merits written by a "Nobleman". A reward of $100.00 was offered by several members of the "United" for a correct genealogy, but the aforesaid "Would Be's" gave it up. To me it looked like a cross between a cumulet, homer, carneaux and a swift. Can you beat it?

BRED TO LAY BARRED PLYMOUTH ROCKS.

Mapleside Bred-to-Lay Barred Plymouth Rocks, as produced by Mr. O. F. Mittendorff, Lincoln, Ill., are well known to the readers of "Everybodys". During the past several seasons, this strain has been much talked of on account of the wonderful egg records accomplished by certain individuals produced by Mr. Mittendorff, notable among these being "Liberty Bell" with a record of 271 eggs in one year and ten daughters of this renowned hen laying the grand total of 2,014 eggs in a twelve months period.

Mr. Mittendorff's catalogue gives a full description of his plant, and a real conception of the merits of the Barred Plymouth Rocks as layers. In addition to havng produced a wonderful line of layers, Mr. Mittendorff has never for a moment forgotten the Standard requirements of the Barred Rock, and some of his greatest layers and their offsprnig have won at the shows.

Write Mr. Mittendorff and we are sure it will be a pleasure to him to give you all the desired information. J. T. H.

A "GONER"—SAVED.

Dubois, Pa., Jan. 7, 1915.

H. I. Co.,
Salem, Va.

Inclosed you will find order for pint of "OCULUM" won on the best bird in our last show, won by Lloyd Taylor, Dubois, Pa., on White Leghorns. I know he has inoculated his ENTIRE flock and is saying a good word along for "OCULUM".

All of the boys are taking to it, so you should have a good business from this vicinity. I have been using it for some time would not like to do without it. One of the worst cases I ever tried it on was a WHITE WYANDOTTE cock last year that a friend of mine imported from Tom Barron. After several of the boys had treated him, and all said that he was a "goner", I took him and treated him with "OCCULUM", and in 48 hours I had him up and eating and my friend used him in his best pen in less than two weeks after, so that I have only words of praise for "OCULUM".

A. H. SINDORF,
Sec. Dubois Poultry Asso.

P. S.—"OCULUM" receives testimonials like this every day. We have printed many of them to inform the public there is a remedy. The H. I. Co., Salem, Va., will send you an "OCULUM" BOOKLET on request.

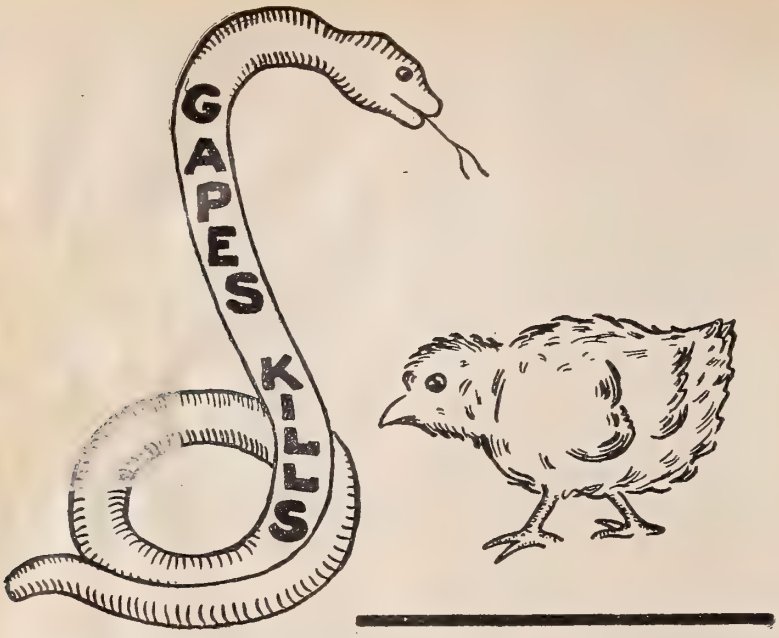
BLUE ANDALUSION.

Mr. E. D. Bird, of Greenwich, Conn., one of the foremost Blue Andalusion breeders of the country has made a remarkable record with his strain of Blues, winning the champion challenge cup at Boston shows 1914-1915. This grand fanciers fowl has been brought to a high standard by Mr. Bird, and his catalog which will be mailed on request, gives you an idea of his line. Write for it, mentionng "Everybodys."

JERSEY GRIT.

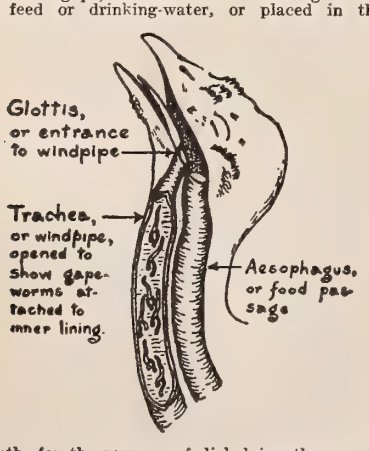
The name Arthur W. Bishop, Paterson, N. J., has for years been connected with the poultry business in that section. Mr. Bishop has among his customers over 40,000 poultry raisers, using his famous brands of Grit. Over one million bags having been manufactured and sold during 1914. When you compare this article with the many inferior grades on the market today, you readily see that here is a superior article. Jersey Grit is sold 300 pounds for $1.00. Write Mr. Bishop for samples and analysis.

J. T. H.



GAPE DISEASE OF CHICKENS.

This disease appears to be general throughout the world wherever chickens are raised. Owing to its widespread and contaminating character, it is more destructive and probably causes a larger loss of chickens than any other ailment they are subject to. Its appearance is due to a smal, red, forked, parasitical worm which attaches itself to the inner lining of the fowl's windpipe. The chicks usually get these worms from ground that has previously become contaminating with them, and by eating or drinking from troughs and fountains that are accessible to older fowls which carry these worms without any apparent ill effect. Each of these forked worms is really two worms, the smaller being the male, which is attached to the larger female. They multiply and grow very rapidly and soon obstruct the passage to and from the lungs, which causes the fowl to gape or gasp for breath. When chckens begin to gape it is necessary to do something to give them prompt relief or they will soon die from suffocation. The Kentucky Exeperiment Station has made a careful study of this disease and has found that the commonly recommended practice of introducing into the trachea (windpipe) a partly stripped feather, or a bluegrass top, and by a twisting motion dislodge and remove the worms does not seem to be practicable for very young chicks. The trasher is so small and so easily injured that it is impossible to dislodge and remove all of the worms by such means. Chicks generally recover without treatment when they are attacked after they are half grown, and hence fowls that might from their size be treated succesfully with a feather do not require treatment of any sort." It has been our experience that after these worms fasten themselves in the fowls windpipe they are so tenacious that nothing short of killing them will cause them to loosen their hold, and inhalent vapors and powders used for this purpose speedily suffocated the chickens instead of dislodging the worms. After the fowls begun to gape, medicines that were given in the feed or drinking-water, or placed in the



mouth, for the purpose of dislodging the worms, passed down the throat and did not have any effect on the worms in the windpipe.

Successful treatment of the disease was not attained until a medicine was used that did not irritate the injured tissues and that could be dropped directly into the windpipe, where it came in contact with the worms and immediately destroyed them. For this two-fold purpose we found Bourbon Poultry Cure a remarkably efficent artcle. This remedy not only killed the gape worms almost instantly when it came in contact with them, but it soothed and healed the irritated and swollen membranes. When placed in the drinking-water and feed it destroyed the parasites and prevented the fowls that were not affected with the disease from contracting it.

The medicine is inexpensive and easy to use, being dropped into the windpipe by dipping a piece of wire or sliver of wood in it, holding open the fowl's mouth and touchng just at the entrance to the windpipe, as the pipe opens when the fowl breathes. This is to be repeated in a few hours if the fowl continues to gape, for if it is properly and successfully done the fowl will show sudden and astonishing improvement. Bourbon Poultry Cure is put up in a concentrated form and a 50c bottle makes twelve gallons of medicine when diluted with water. It can be bought at most any drug store or can be had from the Bourbon Remedy Company, of Lexington, Ky., who will send it by prepaid mail upon receipt of price.

It will pay all poultry raisers to give this remedy a trial, and as disease can always be prevented much cheaper than can be cured, it would be well to have a bottle of this medicine on hand when the first chicks come off and start the season by making every effort to keep them free from disease.

We draw attention to the advertisement in another column, of Bloomer Brothers Company, Newark, Wayne County, New York.

For many years this firm has been designing and making paper specialties, and are among the pioneers in the manufacture of egg boxes of which they turn out upwards of 200,000 daily.

They have designed a combination carton and gummed seal which is attracting special notice ,as sealing the carton insures the eggs against tampering and the seal also adds to the neat appearance of the package. The seal shippers monogram or other design, and this is an added advantage both as to appearance and utility.

The firm making many varieties of egg boxes or cartons, holding one dozen eggs each, both the 3x4 and 2x6 style. The 2x6 carton are oblong in shape and 30 of them exactly fill a standard wooden egg case. The 2x6 style are designed for two rows of eggs in the fillers; 6 in a row, and a cushion all around gives rigidity and protection to the contents.

The firm having an extensive printing equipment and turn out boxes printed with the customers name and any other printing matter the customer desires.

It is obvious that the use of cartons attractively printed and sealed, is an up-to-date method of delivering eggs and a greater factor in obtaining higher prices. The attractive appearance of a market commodity often effects a sale.

Bloomer Brothers Company have also designed a strong corrugated case of paper board, in four sizes to hold either two dozen, four dozen, six dozen, or nine dozen cartons. This fills a long felt want, and is intended to supercede the old wooden case to a considerable extent. The case is extremely light and very durable and can be used over and over again. By its use, the farmer can deliver any quantity of eggs he wishes. The case is very simple in construction and can be instantly opened by removing a strip of gummed tape. Its cost is but a few cents which will strongly appeal to all shippers of eggs. It is thought to be the cheapest case in the market, and the firm believe it will last as long as the old wooden article.

Besides egg boxes the firm manufacture oyster pails, ice cream pails, laundry and cake boxes and many other specialties. They will be glad to send samples of their product on application and also to furnish all desired information to those interested. J. T. H.

OLD FORGE FARM

Old Forge Farm, Spring Grove, Pa., breeders of America's greatest egg laying strain of S. C. Buff Orpingtons, have reduced their hatching eggs to half price as well as choice breeding stock as seen in an ad in this issue. Old Forge Buffs have made records which are official, being kept by disinterested parties, such as officials at America's greatest egg laying contests. Their 230 egg strain is all that they claim. Mr. Glatfelter, proprietor of Old Forge Poultry Farm, makes a special effort to combine utility with the fancy. The wins made during the past year at such shows as New York State Fair, Allentown, Trenton Inter-State Fair, Lancaster, York, Hanover, etc., are conclusive proof as to quality.

Every breeder is trapnested on the Old Forge Farm and by culling twice each season, quality which cannot be surpassed is the result. Bear in mind the 230 egg strain.

During sixty-nine days of February, March and April, out of a pen of ten birds, used as breeders, the following records was made:

No. 1.—59. No. 2.—55. No. 3.—52. No. 4—51. No. 5.—49. No. 6—47. No. 7—50. No. 3—45. No. 9—42. No. 10—48. Total of 492 eggs. Five of these birds were used in Third North American Egg Laying Contest, Thorndale, Pa., last year.

Whistlin' Jim."

That was his title—" Whistlin' Jim."
An, the world it sure took note o' him;
Storm or sunshine, winter or May,
He whistled the troubles of life away.
"Why not?" said he. "In a world so bright.
Why should gay trouble blow out the light
Throwin' it shadows across the sun
A night of tears when the day is done?
Better by far than to weep it away.
"The birds that sing to the bending blue,
I reckon they've got their troubles, too,
Their young'uns leave 'em, afar to roam, an empty nest is their only home;
But they sing to the dark, and they sing to the day—
They sing the grief of their hearts away;
For the world is green, an the light slips through,
The clouds to the blossoms that drip with dew,
An' the birds, they know that a whole life long,
The children of sorrow have need of song."
That was the way that he looked at life—
He knew there was sorrow an' thorny strife
But the Livin' light o' the Lord is shed
O'er the grave that hide Love's dead.
An' high from the window of heavenly blue,
The angels are waving' hands at you,
An' they're not wantin' up there in the sky,
For a soul to come to God with a sigh
That was the gospel of "Whistlin' Jim."
But the world had a welcome of love for him.

BUILD IT YOURSELF FROM OUR SIMPLE BLUE PRINT PLANS

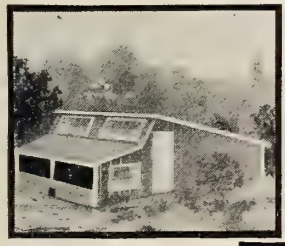
The "DIAPHRAGM"

Automatic Fresh-Air Suction Poultry House is one of the greatest discoveries ever made in the construction of poultry houses. Embodying all the best features of other houses, it also offers something entirely new in having a roosting compartment into which fresh air is forced automatically by the fowls themselves. No matter how many fowls are on the roosts the air will at all times be absolutely pure, thus preventing disease. It is a well known fact that nearly all the different diseases develop during the cold and damp nights, while the fowls are sitting still on the roosts, because sitting directly above the dung they breathe the germ-laden air over and over again, especially where there is a drop curtain in front of roosts. One of the best features which we claim for our house is that **double the number of fowls can be kept in a house equipped with a "DIAPHRAGM"** than are usually kept in a house of equal size, for the greater the number of fowls on the roost, the greater will be volume of fresh air rushing in and expelling the foul odors.

Designed by Louis A. Stahmer

Equip Your Old Poultry House with a "DIAPHRAGM" —It Costs But Litlle to Build

Complete specifications accompany each plan. All measurements are in plain figures, no technical architectural terms used. If you can handle hammer and saw you can build any one of these open air poultry houses from our plans.



Dr. Woods' Open-Air House with Diaphragm Roosting Compartment

THE DIAPHRAGM HOUSE

Plan No. 2 gives complete specifications and meeasurements to build this 8 ft. by 16 ft. model No. 1 or 8 ft. by 12 ft. model No. 2 house. The most scientifically built poultry house.

DIAPHRAGM HOUSE
Model No. 2

WOODS' OPEN-AIR HOUSE

with diaphragm roosting compartments. Plan No. 3 gives complete information to build this most popular house. Thousands of them in use all over the country. Size: 8 ft. by 16 ft.

Anybody Can Build from Our Simple Blue Print Plans

PLAN No. 1 will enable you to build an 8′ by 20′ diaphragm house or one section of a continuous house. It also shows drawings for model No. 2, 8′ by 13½′ building.

PLAN No. 2 shows the drawings for an 8′ by 16′ diaphragm house or one section of a continuous house. It also shows drawing for an 8′ by 12′ model No. 2 house.

PLAN No. 3 gives complete information to build an 8′ by 16′ Woods' open air house with diaphragm roosting compartment or for one section of a continuous house.

All these houses have been endorsed by America's foremost fanciers and have given universal satisfaction under all conditions. These plans are for sale at our office and we will send any one of the above complete plans and specifications for $1.00 or with subscription to the

BRAHMAS

AMERICAN LIGHT BRAHMA CLUB—Mr. Harvey C. Wood, Sec'y Bound Brook, N. Y.

LIGHT BRAHMAS ARE THE GIANTS of poultrydom—The great breeders of this day were unknown until they advertised, and most of them began with the classified ads. Now it is up to you.

BRAHMAS—LIGHT AND DARK. WHERE is the fancier who does not love them? It is just as easy to sell them through the medium of one of these little ads as it is hard to find a fancier who does not admire them.

EVERYBODYS CLASSIFIED ADVERTISEMENTS BRING RESULTS. TRY THEM.

CLASSIFIED ADS are quick sellers They reach the ready buyer quickly. The man who has any special wants at popular prices is sure to look over this list first. They are GOOD advertising at a very moderate price, for they bring results.

WANT ADS for positions wanted, stock wanted, Incubators, Brooders and Poultry appliances wanted, will be accepted at three (3) cents per word. All ads receive preferred positions.

MENTION EVERYBODYS when writing to advertisers. This will do you no harm and it will give us the credit due. Please do YOUR share in making Everybodys the one Popular Poultry Magazine.

BUCKEYES

AMERICAN BUCKEYE CLUB—MR. A. H. Weisburg, Sec'y, Nevada, Mo.

COMPETING FOR BUSINESS WITH well known breeders will not seem so much like setting a toy-spaniel on a giant in the case of the breeder who courageously advertises his stock.

BUTTERCUPS

AMERICAN BUTTERCUP CLUB—MR. G. A. Williams, Sec'y., Warwick, N. Y.

DOLLARS GO FURTHER AND THE REsuits will be more satisfactory by becoming a constant advertiser in Everybodys. A fair trial will surely convince you; try it.

Edited by J. H. DREVENSTEDT,
Breeder and Judge of 25 years' experience and member of Standard Revision Committee 1898, 1905 and 1910.

Fully Illustrated by F. L. Sewell, A. O. Schilling, I. W. Burgess and others.

CONTENTS:

Chapter I—Orpington Origin.
Chapter II—Orpington Type.
Chapter III—Black Orpingtons.
Chapter IV—Buff Orpingtons.
Chapter V—White Orpingtons.
Chapter VI—Non-Standard Varieties.
Chapter VII—Orpingtons as Exhibition Fowl.
Chapter VIII—What Breeders Say.
Chapter IX—Orpingtons as Utility Fowl.

The most valuable feature of all. Text and Illustrations are based on the changes in the 1910 American Standard of Perfection.

Tells what changes were made, why they were made and how they will affect the mating and breeding problems that now confront the breeders of Orpingtons. Progressive breeders and exhibitors who wish to keep abreast of the times cannot afford to be without this book. Text supplemented by over sixty illustrations, by Sewell, Schilling and Burgess, a study in pictures that will prove valuable to breeders, bringing clearly before the eyes of all Orpington admirers in the minutest detail every point of value in the fowl. The book consists of 80 large pages, 8½x11½, is printed on first class paper and bound in a handsome cover.

PRICE, 75 CENTS, POSTPAID, or $1.00 including a year's subscription to this Journal, or will be sent free for three annual subscriptions at 50 cents each.

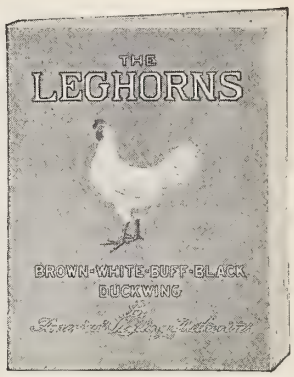
THE LEGHORNS

Standard and Non-Standard Varieties

Most Complete Text Book on the Popular Leghorn ever Published



THIS NEW AND GREATLY ENLARGED EDITION, thoroughly revised and brought down to date, consists of 144 large pages and cover. It tells how to select and mate birds for the breeding pen; how to judge Leghorns in the show room; and how to feed for heavy egg yield and fast growth. Some of the great commercial Leghorn egg farms described and illustrated.

Edited by

J. H. DREVENSTEDT,

Breeder and Judge of twenty-five years' experience and member of Standard Revision Committee of 1898, 1905 and 1910.

This new book contains chapters on the following subjects:

"The Leghorn Fowl"—History of origin and development of Leghorn shape, Standard shape, etc. "Leghorn Type"—Evolution of shape, etc. "Brown Leghorns"—Color breeding, virtues and faults, progress, present Standard, etc. "White Leghorns"—All about them. "Buff Leghorns." "Black Leghorns." "Leghorns in England." "Judging Leghorns." "Commercial Leghorn Farms."—Feeding for best results.

Two Color Plates by F. L. Sewell.

These picture ideal White Leghorns and the true colors of Brown Leghorn feathers—invaluable to Leghorn breeders.

Price $1 postpaid or $1.25 includ- yearly subscription to Everybodys Poultry Magazine. Address

Everybodys Poultry Magazine, Hanover, Pa.

The Majestic Black Langshans as bred today by our leading breeders are of superior general quality, breeding true to size and shape and with improved color. Mr. M. S. Barker, Thornton, Ind., has bred these beauties for many years and has made a desirable winning record East and West.

SUMMER CARE OF THE LAYERS

***Look After the Health and Contentment of the Adult Birds During the Hot Summer and Greater Production and Better Hatches Will Be Produced the Next Year.*--By Prof. Harry R. Lewis.**

ON ALL poultry farms there is always the danger of neglecting the old fowl during the late spring and hot summer. This lack of attention may be caused in many cases by the extra work required in the operations of hatching and rearing. It is too often the case for small poultry keepers to believe that as soon as warm weather comes all extra care of the old fowl can cease, and they can be allowed to shift for themselves until cold weather comes on again. This method of management may be all right in so far as feeding is concerned when the birds are on the range. Neglect of this kind is apt to allow the birds to become run down, and take on a non-productive condition. The average farm birds cared for in a slip-shod way will usually lay no more than from fifty to sixty eggs in a year, but under modern poultry conditions, if a yield of 120 to 150 is not secured the flock is considered unprofitable. The majority of these eggs should be produced in the winter and early in spring, when the price of eggs is relatively high. If next winter's production is to be assured, and the old hens are to produce strong chicks, they must be given special care in the summer. With old hens it is a well observed fact that mortality is much more apparent during the early summer months, and it is largely due to weather conditions, and to a somewhat weakened condition of the fowls, due to their having laid heavy during the winter. The summer time is the period when parasites and disease germs occur most readily, and they are apt to prove a menace to the health of the flock at this time more than any other. Sanitary conditions are harder to maintain, owing to the extreme heat. These conditions point to some problems which confront the poultrymen in the summer care of their birds. The factors which should receive special consideration are as follows:

Look after the health and contentment of the adult bird during the hot summer, and greater production and better hatches will be produced the next year.

1. Handle the birds in the most economical manner.
2. Make a general house-cleaning early in the summer.
3. Renovate and grow green food in the yard.
4. Provide shade for the old fowl.
5. Plenty of water should be constantly available.
6. It is important to ventilate the house at night.
7. Care for the birds carefully during the moult.
8. Guard against attacks of body parasites.

As soon as warm weather comes on in the spring, the birds should be permitted as much range as possible. This means economy in feeding. During the summer period it is not necessary to feed concentrated rations, as it is in the winter, when the flock is closely confined. Dry mash rations especially should be modified. Discard all special concentrated protein feed, as it is possible to get the equivalent from home sources. The continued forcing of the layers during the summer by the feeding of heavy protein rations should be discouraged. It weakens them physically, and shortens their term of profitable production, at the same time it unfits them for further breeding during the next season. Forcing can be successfully carried on during the winter months of the pullet year, but not during the summer. The amount which the rations can be reduced will depend on the area and conditions of range given the flock. If an extended green grass range is available, much of the meat scrap and alfalfa, and part of the gluten meal can be eliminated. The summer foods consist largely of wheat bran and ground oats, with a little gluten feed and meat added.

The early summer is perhaps the best time to give the entire poultry house a thorough cleaning and overhauling. This early summer cleaning is just as important or even more so, than the fall cleaning for the reason that they have been confined to the house continuously for the whole winter, and thus have contaminated it much more than during the same period in the summer. In making the general cleaning, all moveable fixtures should be taken out, all litter and sand removed from the floor, and the interior of the house swept clean. The litter can be spread broadcast and used for fertilizer.

The presence of a concrete floor in the poultry house will materially increase the efficiency of the cleaning. Where a sand or dirt floor is present a few inches of the top soil must be removed, and clean, fresh soil replaced. After sweeping thoroughly, it should be sprayed with a good disinfectant. A suitable mixture should be agitated thoroughly, and applied with a force pump through a fine nozzle. It can be used as a whitewash, and applied with a brush when necessary. This mixture acts as a germicide and insectide, and makes the interior of the house white and clean. After cleaning, the fixtures should be replaced, the floor of the house very carefully covered with fresh litter and land plaster or loam placed on the dropping boards. The windows should be washed

clean and the muslin curtains should be beaten with a stick to remove the dust.

Many poultry farms suffer a serious loss in having limited yards for the laying stock. During the summer months, if the old birds can be given extensive range on the green grass sod, it is the ideal practice. Where small yards are present they are easily contaminated, and unless the soil is of a sandy, coarse nature, the danger from disease is greatly increased. It should be the practice to spade up all small yards, and if they are large enough, to turn with a plow. It it is kept harrowed or cultivated and some quick growing crops seeded, the yards will not only be renovated by burying the top contaminated soil, but the growing of greens for the birds will be possible. Some of the best crops to grow in the poultry yards for summer feeding are peas, oats, buckwheat, soy beans and either rye, wheat or crimson clover for winter cover crops. These crops should be allowed to reach a height of about six inches before the birds are allowed on them. Where the area is large enough, it can be divided into plots, and an alternate system of cropping practiced.

Shade during the summer is one of the essential requirements. A shady spot in the yards can best be secured by having fruit trees planted in them. Fruit trees make shade, and allow a free circulation of air under them, and they are also able to make revenue for the fruit harvested. While the trees are making steady growth, some quick growing grain or field crop can be planted. Corn planted in rows, so that it can be cultivated, sun flowers, soy beans, or even oats or wheat, if allowed to get a good start before the birds are turned in on it, make a considerable shade in the middle summer. If no shade is provided for by growing crops, artificial shel-

There is no better place to summer the old birds than an orchard, providing some succulent green crop can be grown between the trees. There is plenty of shade and a good circulation of air in such spots.

A SMALL SUMMER HOUSE FOR OLD BIRDS

Such a shelter located in shady spots where the birds can have plenty of run will make ideal conditions for holding over a few good birds for breeders.

ters made of burlap should be available. Protection from the hot direct rays of the sun is essential.

The supply of water for the old fowls in the summer is an important item. Large receptacles should be provided, because they keep the water cool, and do not need refilling so often. Hens require much more water during the hot summer months than any other period of the year, and for that reason large and continuous quantities should be provided. Cool, shady places near the poultry houses should be provided for the water supply. Large barrels to which a faucet can be attached will be found very efficient. The small metal fountains will be emptied by the birds as soon as they are filled, and are not practical for large flocks.

A point of interest is that of keeping the poultry houses as cool as possible. This is especially necessary in the ordinary low roof shed, which is covered with black paper. Such houses draw the heat, and unless some special means of ventilation can be constructed, so that the cool northwest winds will find its way into the house, temperature conditions cannot be materially lower.

The management of the poultry flock during the moulting part is always a question of interest and momeat. It is unprofitazle to force the moulting period by starving, with an expectation of getting the birds back to a normal condition and production by forced feeding. It has been shown that during the starving period birds lose weight and they suffer decline in weight and vigor, and it takes considerable time to get back this lost weight after the moulting period is over. The best practice is to feed the moulting birds a normal, well balanced ration throughout July and August, allowing them to moult in a natural and normal condition. It will be found that birds vary considerably as to the time of moulting. Late moulters are usually the best layers, whereas the birds that moult early in the summer are the hens which have nothing else to do, and have utilized the food consumed for feather growth, rather than for the production of eggs. It is good practice, however, to feed a ration during the moulting time which is relatively high for fat and oil, and which contains at least some animal protein. For this reason oil meal and sun flower feed is especially desirable.

Since body lice and red mites flourish in the summer, protection against them should be taken before they get established. The red mites can best be combatted by painting the perches with carbolimbum, or any other perch paint. This painting prevents the lice from getting on the birds at night, when they suck blood. The body louse can be guarded against by providing the birds with a dust bath. It can be made by mixing equal parts of fiine, dry loam and sifted coal ash. This mixture should be kept in a box in the house, and if kept to a height of about six inches and free from litter, the birds will themselves, in dusting, practically keep free from body lice.

Why Is It Policy To Care For Old Birds In Summer

Poultry keepers are in the business for profit and we all realize that profitableness depends on the health and production of matured stock, as well as upon the vigor and growth of the youngsters. These two factors are intimately associated. If the matured stock which are to be used in succeeding years for breeding purposes, are not properly summered, they will not be in suitable condition for the following winter. Their health and production will not only be impaired, but the vigor and strength of their offspring will suffer. These conditions can be corrected by providing cool houses, plenty of range over natural sod, cool, shady places in which to lie during the heat of the day and plenty of cool water to drink. If these factors are provided and the rations cut down in such a way as to make them more economical and just as efficient, the old birds can be carried through the summer at a profit, and be left in excellent condition for the next breeding season.

An ideal arrangement of awnings to keep the sun out of the houses during the summer, thus making them cooler and the birds more contented. Pear trees in these runs provide much shade without the loss of air circulation which is important during dry summer weather.

DOUBLE MATING PRODUCES STANDARD COLOR

***Mating Barred Plymouth Rocks Forty-Five Years Ago--The Color Type Must Be Understood Before the Best Method of Mating Can Be Determined. Double Mating Necessary In Barred Rocks Because the Standard Requires That Birds Match In the Show Pen--Also Necessary In Brown Leghorns Because of the Striping In the Male, But Mr. Platt Insists That the Practice Is Fundamentally Wrong.*--By F. L. Platt.**

The other day I received a gift from the Editor of "Everybody's" a copy of the rare old book, "Plymouth Rocks" by F. W. Corbin. The book was published in Hartford, 1879. To my surprise I found in the chapter on mating five different matings advocated and practiced by breeders of that time. They are as follows:

No. 1 A male light in color mated to dark females.
No. 2 A male dark in color mated to light females.
No.3 A male dark in color mated to dark females.
No. 4 Birds matching in the show pen.
No. 5 A female medium in color mated with a male about two points or shades lighter in color.

The author then comments on the matings by saying that "the best mating for breeding purposes is that of No. 5;" that mating "No. 2" is objectionable; that mating "No. 3" should never be made use of. To me it seemed

quite remarkable that the breeders of twenty-five years ago should have been so familiar with methods of color productions. I have always looked on "Double Mating" as a more recent practice.

Of late I have heard and also read in the poultry journals that double mating was affecting the popularity of the Barred Rock because new breeders were not so quick to take up a variety, the breeding of which was so intricate. A reply however, has been made to this criticism to wit; double mating was instigated and generally adopted to make **easier** the breeding of mates and females that match in the show pens. The standard **requires** that the birds "match" and to my mind, therefore, double mating not only makes the production easier, but by it alone can the birds that "match" be produced and the other points of the color type be held.

What Color Type Means

I like that expression "Color Type".

When breeders speak of the color of a bird, they usually mean to include both the color of the feathers and the design or markings of the feathers. In a study of a feather that is colored after a Standard Pattern, it is plain that there are two features, i. e., feather markings and color. In a study of feathers it is quite important that these two features should be expected. If the bars are of the right shade of color but the white bar is too wide for the black, the section appears light because the markings are defective; if the bars are of proper width yet the black appears dark because of a metallic sheen then the coloring is not correct. When each feather is marked according to the standard pattern and each part of the feature design is of the standard shade of color, a complete harmony of color is seen throughout the specimen. In referring to this **completeness** of design and color a new way is now coming into vogue and that is in the use of the term "color type";

Double and Single Mating Explained

There is for instance, Leghorn type, which means the type of leghorn breed. Then there is the Brown Leghorn color-type, which gives to the Brown Leghorn its individuality as a variety of the breed. It is the reproduction and perfection of the various color types that is of fundamental importance and unremitting interest to breeders of parti-colored fowls. Frequently two matings are made and in the case of the Brown Leghorn, two distinct lines have been developed, one for the production of exhibition males, the other for the production of exhibition females. These are spoken of as double matings. The single mating plan consists of mating a male of standard color and markings to females of the standard color-type. This means the production of exhibition specimens of both sexes from the same pen. The practice of either system is of far reaching importance because the breeding value of a specimen depends on its own breeding and blood line. If a bird is strictly cockerel-bred, it can be depended upon for the production of good cockerels, but is not a fit specimen to use in a pullet mating, likewise if the pedigree of a bird shows it to come from a pullet line, its breeding value is limited to that line and should not be crossed into the exhibition male line. "Why is this separation necessary?"

That question brings us to the real text of this article. Parti-colored birds that closely approach the standard color-type are not always ideal mates. If the standard description of the ideal male is perfectly consistent with that of the standard female, then the two birds when mated together would produce males that not only resemble their sire, but of as good color type as he, while the female yet is the equal of its dam, from a breeding standpoint this would seem desirable. Indeed, we believe that to represent a true variety a standard pair of fowls should be able to produce specimens of both sexes true to standard type, color and characteristics.

One of the most notable cases of enforced double mating is in the modern exhibition or standard Brown Leghorn. Such a male is today, as half a century ago, the consistent consort of the Brown Leghorn female. In England he has remained in fashion and the winners at at the English shows are of that type. In America the fashion was changed. A solid stripe was injected into the male saddle while the lemon ground color of both hackle and saddle has been bred up to a brilliant red. Such is the exhibition male in America. Here is the story of his production, first hand:—

"The matter you enquire about was embodied in an article by me in the "Reliable" about ten years ago. Years previous to that when the craze for striped saddle hackles began, having no stripes at all in my line of males, I used a black leghorn hen and from no stripes, I had them to burn. I had one male from this cross I sold for $100.00 and later on offered $200.00 to get him back. For it developed that the cross was an accidental "Nich" as other black hens would not give like results. What I most vividly remember was the most awful lot of "kicks" I had come in when I began to sell eggs for hatching, as the females came, many of them almost black with breasts color of backs, but I stuck to it and this line of males made my first reputation as a poultryman and incidentally made me not a little money.

Yours very truly,

Signed W. Theo. Wittman,

The black stripe in the back of the Brown Leghorn male was not natural to the variety and is not consistent with the finely stippled back of the female. It is the red saddle free from striping that produces the soft colored, finely stippled female back. The heavy black stripe came originally by employing a Black Leghorn hen and is now produced by breeding females with dark colored coarse marked or penciled backs. This defines the difference between the cockerel and pullet lines of modern exhibition Brown Lghorns.

The black stripe adds to the beauty of the Brown Leghorn male because we have been taught to admire it. The English on the other hand detest it. They know full well, as we admit, that striping in the male is the counterpart of penciling in the females. The exhibition brown female is stippled on the back, not penciled and the color type of the female is reciprocally connected with that of the male and being so related the modification of the one alters the others.

Geo. W. Mitchell could produce his striped Partridge Cochin cockerels and beautifully penciled pullets from the same pairs, but the softly stippled Brown Leghorn female cannot be produced by such a mating. She comes from the "pullet breeding" male, the old style Brown Leghorn, the red hackled bird. The question is: Should this male be recognized as the typical bird! This is purely a theoretical question. We are quite sensible of the fact that when the eyes of an entire family are focused on a particular goal, theory and argument can do little adjusting, but we raise the question now for two reasons.

First: The possibility of a Partridge Leghorn being developed as a distinct variety is forever eliminated. The Partridge male color has already been appropriated by the Brown breeders. They had two lines—the penciled male line and the stippled female line. The latter justifies them to the variety name "Browns".

Second: When a separate mating and a separate line of blood are required in the breeding of exhibition cockerels, while the good pullets come from another pen and distinct line of breeding, should not the standard make some reference to the common practice of breeders in producing standard specimens? Should it describe an exhibition male and female and give it no hint as to the kind of birds required to produce them, or make reference to the fitness of the ideal birds as breeders?

Poultry breeders as a rule are sincere in their catalogues and correspondence. They have no trick in breeding. It seems to us that the Standard should be equally frank, also comprehensive on this subject of double mating.

We should have referred to the Brown Leghorn throughout this article because in it we find a striking illustration of the two methods of breeding. The novice buys a copy of the Standard, he reads the description of the ideal Brown Leghorn male and female, and studies the illustrated winning cockerel and 1st and 2nd prize hens. They are birds that approach the standard color descriptions and he breeds the two. What are the results? Every experienced breeder knows. The Standard had omitted to say that the ideal male color-type and the ideal female color-type was each the result of specialized breedings.

When we grasp the signifience of this fact, is it not natural to ask? Is the Standard Brown Leghorn a true variety? Is any variety whose males of the highest color-type and whose females of the highest color-type can not be counted upon to produce their like when mated together—a true variety? And lastly should not the Standard describe "true" color types?

SINGLE MATING VS. DOUBLE MATING

***Man's Eye Is Imperfect, Especially When Coupled With His Written Language, This Imperfection Makes a Perfect Description of An Ideal Pair of Fowls, Which, If Mated Together Will Reproduce Themselves Impossible.*--By H. V. Tormohlen.**

A FEW years ago when the revised standard requirements made it absolutely necessary for the Barred Plymouth Rocks and Brown Leghorns to be double-mated, the Single-mating vs. Double-Mating Controversy became a favorite topic for poultry publications. There seemed no end to the arguments at that time. But finally the interest lagged and the matter died of its own weight, after it became apparent that the double-mating requirements were in the Standard to stay.

To the beginner and those not acquainted with the Barred Rocks and Brown Leghorns it might be well in passing to explain what is meant by Single and Double Mating.

The American Standard of Perfection is the child of the American Poultry Association. The book now is revised about every five years. A revision committee is in charge of this work. Thus the crude small standard describing the ideal specimens of the various breeds and varieties have been gradually and very materially changed as the revisions go by. The revision committee is guided in its work by public opinion—the demands of the breeders of the various varieties. Breeders are not satisfied with this or that description in the standard and they go before the committee as individuals or as a committee representing some specialty club.

Thus it is seen that the standard today is just what the public has demanded.

A Single-Mating variety is one which will reproduce itself according to standard requirements by mating the specimens most nearly approaching the standard description, together. In other words. mating your prize winning male to your prize winning female.

When the standard was not the carefully worded and shaped work that it is today all varieties were bred this way with fairly satisfactory results. They were not entirely satisfactory, however, as may be proven by the fact that the standard makers of years gone by kept constantly at it, trying to improve upon their work. Thus the descriptions changed and definitions became more accurate.

What brought about the double-mating requirements? you ask. The Barred Rocks were the first to adopt the double-mating plan of producing ideal specimens of both sexes and it came about this way.

Poulterers found that the male invariably, in all varieties of poultry was several shades lighter in color than the female. Barred Rock men would get together at shows and say: "I produced this cockerel and this pullet from the mating composed of these hens and this cock." The cock may have won first prize and his hens nothing, or vice versa. Another party would speak up and say he considered his females ideal or his males ideal, as the case might be, but the opposite sex too light or too dark. Then a controversy would ensue in which the breeders would try to agree among themselves just what shade of male and female would properly mate together to reproduce themselves true to color.

As time went by the controversy became an unending one, because we have no way by which to measure various shades of color. The government sets the standard for lineal measurement and has the true foot rule and yard sticks under lock and key at the Capitol. So it is with weights and cubic measure. So it is with music. We have the concert pitch and two or three other different pitches in music, but the differences are clearly and well known to be just so many notes or steps from the same note in the other pitch.

But with colors there is absolutely no end or rule to go by. In colors we can tell only when two shades match fairly accurate, but when they do not match I say it is two shades off and you may declare it is four shades off and as far as proving either of us right it is an impossibility. You catch the point, dont you? You see there is no standard by which a shade may be measured and so who can tell what I mean when I say one shade or two shades. My idea of one shade might mean four shades to another.

The Barred Rock men then finally thought they could get out of the unending controversy about shades and measurement of shades by making the standard requirements such that particular shades or differences of shades would be eliminated. So they said the Barring should be equal width in both sexes and the males and females match. They could all agree pretty well when they matched they found, and so this method seemed to offer the best solution.

But the ending of one vexing problem brought on another. To produce a male as dark as a female of that day required a dam in the pen much darker than the regulation standard colored females. So the breeders picked out the darkest females they had at the time and mated to the dark males approaching in shade nearest to the standard females.

To the regulation standard females they kept on breeding their light males, picking the shade or degree of shades that their own judgment had taught them would produce the best females. Thus two matings sprung up in place of one whereby the males of one and the females of the other matched in evenness of shade of color and yet could not successfully be mated together and reproduce themselves, but which had to be mated as above outlined.

The Brown Leghorn breeders admired the soft light brown females, but kept constantly striving for a male that did not look faded out in color as did the males that were necessary to put at the head of a pen to produce these beautiful females. They wanted a male with more brilliancy, more color and striping and so with each revision of the standard the male was described more minutely and care taken to make a brilliant finished looking fowl out of him. As the shade kept getting darker the breeders found they could not produce both from one mating and gradually got to picking out dark females—females very much darker than that described in the standard to mate to their dark brilliant males. To their soft light females they mated the old time faded males, just as formerly. Thus a double-mating sprung up for the Brown Leghorns. There was not so much argument about the males and females matching as there was a demand among the breeders themselves for a brilliant beautiful male. With the Brown breeders then it was not so much a necessity as it was a desire. With the Barred Rocks it was an absolute necessity to put an end to a long drawn out controversy about shades of color.

When it became generally known that Barred Rocks and Brown Leghorns were produced by the new double-mating method it created greater consternation than ever the controversy about shades of difference in the old Rock standard.

With the improvement, if such you allow me to call it, in the Rock and Brown Leghorn standard other varieties were just as surely being given more definite and accurate descriptions which in turn required more skill in mating to produce the desired results.

When the controversy over the Double-Mating vs. Single-Mating waxed warmest breeders of other varieties began to declare that they too were producing the best specimens by a double-mating plan.

Why could they no longer produce White Plymouth Rocks, White Leghorns, and in fact most every known variety by the old single mating method was the question.

This is the question that J. H. Petherbridge put at American Poultry Journal readers in his April article. He had read the article by Dr. Woods in the January issue in which nearly every variety in which more than one gave directions for mating found double mating enthusiasts. This greatly disturbed Mr. Petherbridge and he insists that the whole standard must be made over, so that every variety can be single mated. He said we are all wrong, and an editorial in the same April issue comes to his rescue and seeks also to prove the present standard is wrong and that a new standard should be

made, making it possible for all varieties to single mate, and supports his contention by comparing the wild Wood Ducks, Mandarin Ducks and Wild turkeys, with our standard varieties of domesticated fowls. He contends that these wild fowl breed true to nature from a single mating and therefore all domestic fowls will do the same. They should do the same, we must admit. Every poulterer has become thoroughly disgusted and disappointed to the point of quitting the breeding of fowls entirely some time or other in his life because his fowls did not breed true and has condemned the present standard in forceful language.

But condemning an evil and righting it is a different proposition. We would all like to see a single mating standard for all varieties of poultry but we do not entertain the hope that Mr. Petherbridge does, that a standard will soon appear which will make it possible. It is not only improbable, but altogether impossible. The reasons it is is impossible are many.

Scientists disagree as to the common ancestor of our domestic fowl. She is an artificial product—man's making entirely. So long has she been in domestication that the memory of man nor the pages of history do not record when she was taken from the wild and domesticated. She may be one of the four Gallinacous tribes or she may be a cross of one or more. That she is a descendant of the Jungle-fowl of India no one can prove. Indeed, of recent years some good authorities contend that she is the progenator of the Jungle-fowl, instead of being a descendant.

If we could get back to the starting point with the domestic hen as we can get back to the Wood Duck, Mandarin Duck or Wild Turkey then we could formulate a standard strictly according to nature, providing we could describe what we saw.

If the Wood Duck had been domesticated for thousands of years and numberless varieties produced according to the fancies of man it would be utterly impossible to formulate a standard describing ideal specimens of male and female which, if bred together, would mate true, just as it is impossible to make a perfect standard today.

The reasons for our inability to make a perfect standard are not only because we cannot get the original wild ancestor of our domestic fowl to look at when we formulate the same, but because of the imperfection of our sight and language.

Mr. C. F. Webster, Girard, Pa., has been for years producing exceptional White Plymouth Rocks, which also have been winning at America's leading Poultry Exhibitions, both in the hands of his customers, as well as himself, making this line of White Rocks among the leaders. Above is pictured a "Garden" winner, whose blood is reproduced in many of Mr. Webster's flock today.—J. T. H.

To prove this we would like to see a committee of single-mating enthusiasts get together and make a perfect standard for the Wood Duck, Mandarin Duck and Wild Turkey. They bred true to nature and nature has her perfect standard but man, never. He cannot describe nature's perfect work and in trying to, he misses perfection just far enough that in a few generations of domestication and breeding, according to the written standard which seeks to follow nature, we find that the natural color requirements have been changed in spite of all we can do.

The turkey is a fair sample of what I seek to explain. It has been in domestication only a few years, compared with the domestic fowl and yet we have three or four distinct varieties already and most of them originating from the bronze turkey. The American Standard of perfection seeks to follow the color and markings of the wild turkey in describing the domestic Bronze turkey, but yet turkey breeders differ in being for or against the present standard and many of them contend it is natural while others declare it is an unnatural standard according to their point of view. In years to come, unless some of the best specimens of wild turkey today are preserved and mounted for our standard committee to go to, we will find the turkey men up against an imperfect standard and as a result of the imperfect standard some breeders will find it easier to produce females according to the imperfect standard description by a certain method of mating and to produce males by another mating.

Man's eye is imperfect, especially when coupled with his written language and this imperfection makes a perfect description of an ideal pair of fowls, which if mated together will reproduce themselves impossible.

In passing it might be well for us to recall that every variety admitted to the standard was admitted with the declaration that they bred true to color and shape from a single mating. Indeed, without this solemn oath by the originators they could not have been admitted. How strange it seems, doesn't it? One man can originate a variety that he declares will breed true as wild turkeys. He may be honest in his declaration but he has a very crude standard —possibly like the Buttercup standard of a year ago. But when several men get the same variety as they have the Buttercups and Campines then it is that competition waxes warm and these same men insist that the judges declare which specimen the most perfect. As a result we have a more carefully worded standard. Men will not permit a fowl to be both spangled and barred indiscriminately, and so they arrive at more definite descriptions. The Campines, Buttercups and Orpingtons all have a single mating standard at present and every breeder will solemnly declare they bred true and ever will. But in the evolution of the standard the Buttercups and Campines and Barred Orpingtons will be double mated in the short space of five years with every breeder fighting against double mating at that or I miss my guess greatly.

Instead of changing the whole standard at once let the single-mating enthusiasts take the Campines or Buttercups as shining examples and make a standard which will forever make it impossible for breeders to breed more perfect specimens by the single mating plan.

It is a commonly acknowledged fact that the most successful breeders of nearly every known variety today double mate with the exceptions as above noted. The evil is already upon the parti-colored varieties, the white and the black varieties. Let the single mating enthusiasts make a standard for the varieties named as well as the Sussex and other new varieties that will make single mating impossible and in 1920 I would like to have a report, 1920 will see the winning specimens at the five leading shows produced by the double-mating, regardless of what they may do or say against it. It is inevitable.

THE RANCOCAS POULTRY FARMS

Brown's Mills, New Jersey

FOUR GREAT FARMS OF 560 ACRES OF POULTRY; A MILE OF BUILDINGS

***Three Farms Combined For Utility Breeding of Single Comb White Leghorns and One Devoted Exclusively to Quality Breeding of Single Comb White Leghorns and White Rocks. "They Were Bred At Rancocas" Applies to Both. Every One of the Thousands of Young and All Show Merit.*--By H. P. Schwab.**

OF ALL the great poultry plants that it has been our privilege to visit during the past many years of our travels none has impressed me more with its actual value to the industry and the poultry breeders in general than have the Rancocas Farms at Brown's Mills, N. J. Great as they were at the beginning, they are greater now, and this progress has been particularly noted within the past two or three years. Here on every side, in the office, in the incubator cellars, in the brooder houses and in the laying houses as well vigorous business is evident,

Office and headquarters of the Rancocas Poultry Farms, Browns Mills (In-the-Pines) N. J. Solid, Substantial and Reliable in buildings and in quality of stock.

things do move, and they turn in a substantial, progressive way that bids well for the future.

We look upon this great plant as an ideal and a model and I believe its position as a leader is most generally accepted throughout the poultry world. From its very beginning it was a practical, safe and paying plant whose influence was felt in every section with beneficial effect to many.

Lessons seen and heard here are not easily forgotten. System is the word, for go where you will, you will find a practical reason for everything you see, theories and pet ideas are knocked-sky-high, and when you land on reasons you will gladly admit that "The Rancocas way is the Right Way."

Her Mr. Reese V. Hicks, as general superintendent, is the "Boss at the Wheel," for the years that we have known him we always found him practical with sensibleness combined, we considered him one of our very best poultry judges. Now we can say that we admire him, for his successful work at "Rancocas" is a most beautiful lesson of poultry possibilities for which we all owe him much. Not all the credit is due to Mr. Hicks for his success, we will mention some others, stil there is glory enough here for all to enjoy.

THE QUALITY FARM

The Rancocas Quality Farm is in personal charge of Mr. M. L. Chapman, well known as a breeder, who has mastered the art of conditioning birds, Here are bred their Quality White Plymouth Rocks and S. C. White Leghorns that for some years have won National honors at M. S. Garden, New York, Palace New York Show, Boston, Pittsburgh, Brocton, Williamsport, New York State Fair, etc.

Space forbids giving their record complete for the past two or three years, so here will but mention their last two exhibits of 1915, at Pittsburgh Exposition Show, January 1915, the Annual White Rock Club Show, they won Cock, 1; Hen, 1, 2, 4; Cockerel, 1, 2, 4, 6, 7; Pullets, 1, 2, 3, 5; Old Pen, 1; Young Pen, 1; Shape and Color Specials, Etc. In S. C. White Leghorns at M. S. Garden, New York, February, 1915, they won Pen, 1; Cockerel,

The Rancocas S. C. White Leghorns are busy bodies. Health, Vigor and Laying Qualities are noticable.

4; Hen, 1, 5. Best Colored and Shaped female and Champion female.

Here in their yards were seen most of their winners of the past three seasons and in White Rocks particularly. This line has characteristics in shape and head points that closely follow standard demands, there is similarity and the "sameness" to all, a quality of highest value for it is the absolute proof of breeding worth. The fine long backs and body with breadth and depth, full saddle and full low carried tails, deep, broad breasts with absolute white plumage. Even combs, red eyes and rich yellow legs are noticeable features found on every bird on the place.

Their S. C. White Leghorns, as the records show, have this year won "Two First Prizes' at the M. S. Garden,

A typical scene on the Rancocas Poultry Plant. The birds in-the-Pines.

New York Show, and like their White Rocks, have been consistent winners for two years at shows East and West, with the New York State Fair, Boston,Williamsport, Palace, New York, and others of quality included.

In this line we particularly noted their type and size with excellent carriage and fine finish, well portioned in body, good legs with low carried full tails. Head points are a feature in this line, being very neat and uniform to a high degree.

We can't expect to see birds at their best the first of June, at about the close of the breeding season, still with birds of quality like these carry, they are always admirable. A general eveness of high-toned worth was evident to all.

There are probably 2,000 youngsters of these two varieties, roaming In-the-Pines, a thrifty lot full of vigor that promise much for the future.

THEY WERE BRED AT RANCOCAS

The above slogan carries with it all that a frank statement of breeding worth can mean. It is an assurance of value as well as of highest practical worth for those to consider that wish stock birds right, with an assurance of reproduction of equal or improved value in the young.

THE UTILITY BREEDERS

Their several great flocks of "Utility Breeders," were of special interest to us for several reasons, the first being that here were upwards of 25,000 yearling and two year old S. C. White Leghorn Hens, that were only bred in line for years past for profitable egg production, but were also bred along standard lines for real quality. I am free to confess that I never expected to see a flock of this size, every bird of which carries a high standard of quality in shape and color. Surely this is the result only of geatest care in selecting and breeding. The mode that has made this stock what it is, is the same that has made possible the success of these farms.

Size with shape was another prominent feature. The general size of the females seemed to be above the average, they are "Big Leghorns" still, with all the fine drawn lines we look for in the finest show specimens.

Condition—In our day's journey over all these farms (I regret it was not a week's journey) I did not see a weakling or an unhealthy bird. Every specimen seemed dressed as if for inspection, still they were roaming at will, busy digging in the underbrush or dusting in the sun. The white of their plumage making a sharp contrast to the deep healthy red of their combs and face. It is not our habit to get over-enthusiastic at any time, but in all fairness we must say that this line of stock was superior to what we expected. That its general quality was of the best, that it has superior worth and that Rancocas assures value to every customer. It can't be otherwise.

Many times the story has been told how these flocks of 500 females each are fed and cared for, how the records are kept and how the work is done, so beyond saying that it is the "System" in every department, we will write of other interests at this time.

The four (4) farms now comprising this plant number upwards of 560 acres, all except the "Quality Farm," where their high grade exhibition stock is bred and kept, connect and easily three quarters of this total amount is devoted to building and yards for the chicks, the balance to the growing of green foods roots, etc. Another farm of about 60 acres fully equipped with several large buildings has just been leased as their ever increasing business demands more space and a greater capacity year by year. Progress is just as evident here as it is deserved.

The total incubator capacity now is 165,000 eggs every three weeks while their brooding capacity is really unlimited as besides two larger brooder houses they use almost exclusively their International Sanitary Hover.

Brooder houses are in fact a thing of the past and are considered an expensive luxury. The idea now is to hatch your chicks and to brood them under hovers right in the poultry houses where they are to mature and where they are to live and lay. Here are flocks of birds who have never known but one home, and they are more content and better for it. This idea is worth considering, it surely has its features and is most practical.

Many of the old pet theories are knocked-sky-high in practise here, this brooding is but one of them, and it is one to take and become popular for the advantage seems to be in its favor. Mr. Hicks is working out his theories here and they do seem to be right, surely we can't question them after looking over this great plant and noting the reuslts. In the egg room we were shown records for the past month and hope later to get this data complete for our readers for comparison of this American-bred line with that of any other known. The day of our visit and the three days preceeding an average of over 7,000 eggs per day were gathered, but as we do not know the

Bred at Rancocas'' means quality; a familiar scene at their plant in-the-Pines.

exact number of layers, this figure tells but little, roughly we estimated that the entire flock would show an average of better than 180 eggs per hen per year. The quality of the eggs was surprising, while they were being sorted, it was evident that close to 96 per cent of them were A No. 1 in szie, shape and color.

THE HOVER-INCUBATOR MANF. CO.

With Mr. W. A. Wilson in charge, this company is also a part of the Rancocas Farms Co., in a way, and are manufacturing incubators. hovers, feeders and a general line of poultry supplies. The International Hover is a leader used the whole world over with pronounced success. It has made possible the brooding and rearing of chicks, without the expense of special buildings. We have seen these hovers on hundreds of plants and still have to hear of a breeder who has not endorsed them.

THE RELATION BETWEEN A. P. A. REPRESENTATIVES AT LARGE AND THEIR CONSTITUENTS

***Their Reciprocal Duties and Obligations*---By Charles D. Cleveland.**

I AM a strong believer in, and an ardent supporter of, the American Poultry Association. I have attended every convention since my election to membership and have seen and participated actively in the work of the association. I have found that it consists of a very large number of earnest men, the great majority of whom are striving to do their utmost to carry on the large work falling upon the shoulders of the Association; endeavoring to maintain the high standard set by a majority of poultrymen and working hard to keep pace with the expansion of the poultry industry.

In an organization so large as the American Poultry Association there will always be found a small per cent. of dissatisfied members whose chief pleasure in life is in tearing down and not building up. This minority lives on criticism and thrives on personality, but among the rank and file it necessarily receives but little consideration and its arguments have really no weight with the majority of thinking members. Kickers are a very good thing in any association. We do not all think alike and often arguments which seem at first either absurd or useless sometimes prove in the end to be "the better reason." The Association in the past has made mistakes and it will continue to make mistakes in the future, because its members are human and, therefore, not infallible; but, to my way of thinking, the principles and general practice of the Association have placed it upon firm ground and it should receive not only the support and encouragement of a vast majority of the poultrymen of the country, but it should also enlist their active and constant interest.

"Bringing in the Eggs"—A habit exists here of bringing in an average of over 10,000 eggs per day.

In so large an Association the real work must necessarily be entrusted to the officers and excutive board. It is impossible for membership at large to know as much about the affairs of the organization as these men, whose duties compel them to become thoroughly familiar with the details of carrying on the largest live stock association in the world.

Now what is the duty of this membership at large to the officers and the members of the executive committee and what are their duties to the membership? Is there not some active duty on the part of the members to consult and advise with their representatives so that these representatives when attending Annual Conventions will be familiar with the real wishes, desires and aims of their constituents? How else can these representatives properly serve the people who elected them? Again, is there not the duty resting upon the shoulders of each representative to endeavor to get in touch with the membership and find out what that membership wants and what it does not want?

Rancocas lay and thrive in the houses where they were brooded. Note contentment.

It is quite manifest in the first place that the Association does not elect its officers and delegates hurriedly or without thought. Ample opportunity is given under the constitution for the serious consideration of the selection of these officers—the people may elect whom they choose; but it seems to have become largely the practice that, once having gone through the election, these representatives are left entirely alone to do the best they can upon their own responsibility. Ordinarily they receive from their constituents no information of the stand which they should take on important matters upon the floor of the convention nor are they often either criticised or blamed for any action they may have taken. Is this because the membership at large does not appreciate the heavy responsibility that rests upon the shoulders of these men or is it because the mem-

bership does not care? In either case the fault is with the membership and the sooner this is corrected the better it will be for the Association. These men occupy the same general position as members of a legislature. They sit in council and pass the laws which are to govern the Association and the membership for each ensuing year and they come from all parts of America and from geographical sub-divisions of the country where conditions, opinions and the needs of poultrymen are different. Therefore, before each annual convention the membership should get in touch with representatives either personally or in writing and state plainly the wishes of the people, and it would naturally follow that the action of these delegates should be in accord with what they believe to be the sentiment of a majority of the persons whom they represent.

To be personal for a moment, I am now, and have been for the last three years, one of the Eastern representatives at large of this Association and I can count on the fingers of my hand the number of communications I have received from my constituents with reference to their wives on great questions which have come up before the Convention since my election. I feel sure that I am voicing the sentiment of all the delegates at large when I say that this is not the situation in which we wish to be placed, and our conclusions are that for some reason the majority of our constituents are not enough interested to take the pains to get in touch with us. Personally, I am writing these few lines with the hope that prior to the convention in November next I may be put in a position to know what stand the eastern membership of the Association takes up the matters that are coming up for consideration in the Executive Board and on the floor of the Convention.

I can see that it is the duty of each such representative, not only to invite the opinions of the membership, but also to state on request his personal stand on any question and I now, in fulfillment of what I believe is my duty, invite the views and opinions of all members of the Association on any matter to come before the Convention or upon any new proposition which should be taken up and dealt with by the Association. In the future, as in the past, if my personal views should differ from those of my constituents I shall make this plain upon the floor.

In a number of matters in the past I have differed with what has been an apparent majority on the floor of the Convention upon several questions and I shall continue to argue in favor of my propositions just so long as I believe them to be correct and for the best interests of the majority whether these views be popular or not—"Give me liberty or give me death."

Nothing will benefit the Association to a greater extent than the active interest of each member. The members make the Association and under the new constitution are more than ever in a position to directly assert their wishes. It should, therefore, be the pleasure, as well as the duty of these members, to express their views on the floor of the Convention through their delegates. These delegates are the members of the executive Committee, elected at large, and the representative of each of the State Associations, elected at the annual Meetings of such Associations.

It now seems as if the poultry industry, both utility and fancy, was on the verge of great prosperity. War conditions in Europe have been depressing and harmful to the business. They are beginning to improve and when the war is over America must be prepared to restock Europe. It is necessary that we prepare and lay correct foundations for the business which we know is coming. The Association can help us and we can help the Association; therefore, the membership should bestir itself and get in direct and immediate touch with the officers and members of the executive board.

THE BARRED PLYMOUTH ROCKS

Their Origin, Characteristics, Mating and Breeding; Value of Shape and Color, Etc.

By H. P. Schwab.

CONTINUED FROM LAST ISSUE

SIZE AND WEIGHT.

The Standard size and weight is the same for all varieties of the Plymouth Rocks, and we may as well here state that also the same type and form is required for all varieties of this breed. The required weights are: for cocks, nine and one half (9½) pounds; for hens, seven and one half pounds; cockerels, eight (8) pounds; pullets, six (6) pounds. These are the standard weights for all the classes and they are most reasonable to secure. There is no advantage to be had in breeding for more or less than this size, and we would recommend that in selecting and mating, other things being equal, that the birds nearest to these weights, be used. They easily can be bred up to increased size, but in doing so you will surely lose more in other qualities than it will be possible to gain by the extra weight secured.

The object is to have fowls attain a certain size and weight at maturity, and at the earliest possible age, and herein lies one of the strongest and most reliable and valued characteristics of the Plymouth Rock. Therefore, it must be evident to the reader that if they seek for increased size, they will surely and first of all lose this characteristic which is so valuable to every strain.

It is my opinion and facts have often demonstrated that the nearer to standard weight, the better the quality and the truer shape. Over-size as well as under-size are defects and while a pound over or under are allowable at times, don't go beyond that, there is no reason for it.

WHY WE DOUBLE MATE

The idea of double mating is to secure male and females that properly match one another in color, markings and to have in each, the same eveness of shade. Nature's laws provide the male with several natural colors, lighter than the female, this is also true of all parti-colored varieties, and as the standard demands for exhibition specimens which are of the highest state of breeding to match one another in color, it is positively necessary to double mate to secure these results.

This same question of douuble mating confronts the breeders of all varieties alike, even the solid colored ones, where a double mating has done more than any one other thing to bring them up to the present high standard in quality for practical worth, as well as for exhibition, therefore this question is by no means confined to the Barred Plymouth Rocks alone as some seem to think and believe.

The greatest winners, and the best specimens we have seen and handled in all leading varieties, are the result of double matings. Further, it has been conclusively proven time and time again, that all animals vary in breeding quality and showing a marked tendency to throw either extra good or indifferent and inferior quality in one or the other sexes. By double mating the lines that have shown their superior strength for producing males have so been bred for that purpose by making as we have it today, as the male producing line or cockerel mating as it is commonly called while those that gave us the best females are the pullet breeding line as we have it now.

The origin of the Plymouth Rock must also be considered in this, for beside the influence of nature's laws, we find that most of the top or male crosses were made with light colored birds on dark and strong colored females and in several cases on black females, as the Black Javas, Black Spanish, etc., so that their natural breeding conditions favor the light male and the dark females which render it quite impossible to produce from one mating males and females in the desired shade of color that match properly. The facts are that all great breeders have followed this style of mating for years, which has proven the foundation of their success.

I believe the standard perfectly right in demanding the male and female to properly match in color and mark-

ings and that the double mating system has many advantages that has never been credited to it.

Line breeding has been brought about by double mating and has given results in breeding far beyond our fondest hopes and expectations in producing quality par excellence, besides the grandest shade of color with the most perfect markings. The up-to-date barring that we have on the Barred Plymouth Rock today is wholly due to double mating, and would never been obtained in any other way of breeding.

DOUBLE MATING.

The system of double mating is to mate the standard colored male to females of the same line that are several shades darker and stronger in color than the stanadard colored females, to produce males of standard color and barring.

And to mate the light colored pullet bred male to the standard colored females to produce females of standard color and barring. This is the system used by the breeders in general

SINGLE MATING.

There are those that claim to produce standard colored males and females from the one and same mating, while this may be done to a certain extent by using a standard colored male to several females that vary in color from extreme light to extreme dark. Still I hold that this is not single mating in the proper sense that they wish to imply. Strictly single mating is to mate and produce from one pair, not trio or pen, where all shades of females can be used, both males and females of standard color and markings. We have never heard of this being successfully done, nor do we ever expect to see it for it has no apparent advantage, that would draw the efforts of the breeders along such lines.

Results of such matings, no matter how fine the specimen produced may be, they would simply be chance birds without quality breeding back of them and of no real value as breeders with any chance or hope of their reproducing. It must also be evident to avoid over inbreeding, the breeder would be kept busy in buying and supplying new blood for it would be only the first cross, that would under any consideration, possibly give some fair results.

COCKEREL MATINGS.

THE MALE

This is the mating to produce the highest grade of standard colored males and as would be supposed, such mating is to be headed with a superior male of standard form, color and barring. Quality like blood tells, and it is essential not only to have the highest possible quality but to know the breeding value of his line, and to at least estimate the proportionate value of his defects from a breeding point of view, while some defects are most harmless, others are serious from this view point and all are undesirable.

The line breeding of the male is I believe most important for a male bred from a well known and successful line with years of careful mating and selecting back of his breeding, offers many advantages and more opportunities for success. Blood lines will surely prove their worth and their breeding value cannot be over-estimated.

Chance Birds. They are nice appearing specimens and very likely at times even may be winners, but have come from unknown or haphazard breeding, and most unreliable to use. We have seen many such and some very fine ones, but they have never produced within fifty per cent of their own quality. It is the bird with breeding back of him, whose mating was made for a purpose and whose ancestors were winners and of proven worth as breeders to bank on and to build on for your future success, that is the only reliable kind.

Next to his blood line consider shape, it is positively essential that the male form should at least approach the ideal in general makeup. There are no perfect birds and never will be, so we must not expect perfection, but let us at all times be critical and get in type the best within reach.

The typical Barred Rock is a creature of stately beauty with nothing gawky or unsymmetrical about him. His general appearance is one of strength and vigor well carried and cannot be mistaken wherever seen.

Eveness and uniform color are next in importance, followed closely by proper barring which has been described. The true shade of color with the bluish cast shows sharp where the bars are properly straight and their fineness will vary but little from tip to tip. There are extremes both in fineness and coarseness of barring, the one may be an advantage while the other is a sure disadvantage.

The eyes when of proper color (red) are admirable and a most valuable asset, while poor colored eyes are a serious defect and very difficult to correct when once bred in a flock. The male should stand straight and strong on legs set well apart, always avoid the knock-kneed males.

COCKEREL MATING.

THE FEMALE.

The females to be mated to the standard colored males to produce males should also be of a line bred cockerel producing family, such are several shades darker and stronger in color than the standard colored female. In these I would first of all stake my faith on their breeding and where this is found correct, then her general make-up would be of minor importance.

In these females we aim for strength of color and while we do desire in her plenty of proper and clean barring, it seldom is as snappy as we would like to see for the sake of appearance, it is no defect to have the perfectly bright and clean, and the fact is that the females we know have produced the best known males and some of the greatest winners, were rather difficient and indifferent in clean and snappy barring.

I have seen many cockerel bred females that were wonderfully barred, very narrow and regular with the light bar surface and under as clean as in the standard bred female, but these have seldom proven to be the best producers of highest grade males. Their improvement has been individual only and not of the breeding order, but this will come in time and it is for this reason that I urge the breeders to look for and to breed for the cleanest light barring possible to be had in the cockerel bred females.

While the cockerel bred females, as before noted, are several shades stronger in color than the standard colored female the difference of color and shade lies in the light bar, and not in the dark bar as many suppose. The dark bars of both lines are the same unless there is metallic or sheen in them, while the light bar varies in cleaness and brightness in the two lines that make the difference in appearance.

In the clean and narrow barred cockerel bred females we can easily see what the future has in store for the breeders, for if we ever do get to the genuine single mating, and if the mating has any real advantage to offer over the double mating (which I very much doubt) then single mating with very slight modifications of the Standard can and will be had from this style of females and from the cockerel line. There is no possible chance for it ever coming from the pullet line.

In form, we expect the cockerel bred females to be near models for shape at every angle of the breeding question looms up, as the most desirable and important question to be considered and in these cockerel bred females we want to emphasize this.

There are several points that the breeders look to specially in this line of females, the most important of which is the tail. The female with a full and abundant tail well spread and well carried is greatly desired, while a female with a short and pinched tail would not be considered for a moment. Comb and head points are also of particular value in this line. They are the points that show at sight on the male and we can best hope to have them right by breeding from birds that are strong in these sections. The breeders who will breed serious defective birds with hope of overcoming that defect by mating to others that are strong in that section, is only taking a long chance on gaining his desires. It is far better to breed from a few birds that are good all over and without serious defects, the defects will crop out sooner or later and are sure to come just where and when not wanted.

PULLET MATINGS

THE MALE.

The pullet bred male must be very similiarly considered with the cockerel bred female for in both of these we find their greatest work as breeders in their ancestorial line. Indiviual quality is important in each and should not be underestimated, still for all of this the real question is "What is back of them?" The line value has been illustrated times without number and as long as time lasts it will have the same value and effect.

so if the breeder will look well to this he will be sure to be right and can confidently await the result.

The pullet bred male is several shades lighter in color than the cockerel bred male, Standard or cockerel bred male should be well and evenly bred surface and under in all sections. With his light color we do not expect to find the strength of barring as in the Standard male, but we do expect eveness and distinct barring in all of his sections.

Beyond the shade of color and among barring we should look well for all other standard points with special care as to form. The pullet bred male with broken and uneven barring, with washed out color on neck wingbows, breast or tail. Poor colored eyes or head points are only good for market poultry. Beware of these defects for breeding purposes.

In this line we also find many males defective in type and will not try here to account for this, still it is a well known defect so look for breeding and shape, with all the barring and eveness of color that can be expected, if you wish to produce pullets of the standard color and quality of fair proportion.

PULLET MATING.

THE FEMALE.

The Standard colored female bred up to the highest quality is the proper pullet producing female and the nearer she comes to all the standard requirements in shape, color and barring the greater her breeding value providing of course, she has that line of breeding back of her, now we do not wish to be misunderstood in this or do we wish to infer that only the very highest grade of exhibition specimen is fit to breed from, with expected results in approvement attained. For many years the trouble of most breeders has been their idea that all they required was a choice male and that almost any kind of a female would do. This is entirely wrong and they have failed for all these years, simply because they have underestimated the real female value in breeding.

The female qualities are important factors in breeding; far more so that she ever received credit for. The breeders who have seen and understood this have succeeded while those who have not, have failed. The quality of the female is nearly if not fully as influential as that of the male and we don't believe that we have ever seen a good chicken from a poor or indifferent female. If we consider the females that for the past five years have been winners at all our best shows, we can well trace about all of them back to one notable hen of a few years ago, one that was years ahead of her time and whose color and barring were a revelation to all who have seen her, to her line and to her blood and breeding value, which now is liberally distributed the world over. We owe all that we have that is best in the female line which is the best argument we can offer for the female value in breeding.

The neck and wing of the Standard bred female are both momentous sections, and are also the ones usually found deficient to a more or less extent. Broken and weak barring in the neck that fails to run across. Wings that are too dark and strong in color of flights, deficient in the light bars are the conditions so often found that should be avoided. Look well to these sections and breed only from specimens that are good and proper in them.

Again we advise look well to your female breeders, spare no pains in selecting them and use only such that would satisfy your desires thoroughly were the same condition of plumage inherited by their future chicks.

SUMMARY.

From the above the reader will note that the proper cockerel mating is to breed the standard colored male to the darker and stronger colored females, it is the dark to dark to produce the best males, while the proper pullet mating is to breed the light male to the standard colored females or light to light.

The blood lines of each differ entirely, and if crossed one on the other the result would be very inferior and indifferent in quality and of no particular value as breeders for the future. The birds should be at all times bred true to their lines for best results.

When breeding for the highest quality it should never be a question of how many to breed from; let the question be how good regardless the numbers, the results will be most satisfactory in the end. No fowl not true to its bred characteristic should be used as a breeder at any time. Take every care in making your selections and then carefully note the results and seek to learn all that they offer. If improved quality is shown you will know the cause, if not improved, learn the cause and make corrections and then try again. Make an honest effort and you will succeed.

THE SINGLE COMB BUFF LEGHORN

***The Buffs a Superior Variety; Comparisons Between the Buff and White Leghorns; Pointers In Mating, Etc.*--By J. Courtney Punderford.**

Does the Single Comb Buff Leghorn compare favorably with the White Leghorn? This is a question I have to answer daily, both by mail and verbally. My answer is, Yes, and well emphasized. Allow me to state two facts which I think will convince the reader that the Buffs are equal, if not superior, to the Whites.

Every breeder raising poultry simply for eggs prefers the variety that produces the greatest number with the least amount of feed, providing, of course, that the variety bred has the call. Compare one house of 200 pullets with one of an equal number of Whites, and at the end of six months compare your egg record, and feed bills for each house and see where you stand. Your egg record will, in all probability, be the same, but you will find a great difference in your feed account, and it will all be in favor of the Buffs. They take much less feed to produce the same amount of eggs as the Whites. I know for I also breed the latter. I think you will say that the Buffs have scored one point here.

They lay a pure white egg, so do the Whites, and they lay a large egg, as also do the Whites, and one more point for the Buffs, they will dress fifty per cent better than the Whites, for when sold as broilers they have that rich golden color which the White birds lack. Here let me say that the Buff Leghorn will make the finest broiler, and will reach that stage quicker than any other breed I know of. I have supplied several of the largest hotels in New York for the past eight years with their squab and pound and a half broilers, and my Buffs have been pronounced to be far ahead of my Whites, both having the same care and attention.

They are hardier than any other variety of the Leghorn family and not so susceptible to the general ailments of poultry.

So much for the Utility end of the Buffs. Now for the fancy. They are very popular, and many fanciers claim that they are the coming breed and will out-shine all others in the near future. Look at the Buff classes in most of our leading shows. They are very large, and in some sections out-number all other Leghorns. High class specimens, both male and female, command large figures. They breed truer to color than any other Buff variety, and when one gets that rich golden Buff, free from black or white, is there any prettier sight?

It is wonderful the strides the Buff Leghorn Breeders have made during the past five years, both in color, type and head points; the later being especially defective heretofore. Last season, the country over, Buff Leghorn fanciers were unable to supply their egg orders, and this year the demand for high class males and females has been tremendous. Wide awake fanciers are realizing that the Buff Leghorns is a money maker, and the number of Breeders that are now getting in the Buff Leghorns demonstrate the fact that they are waking up to the situation.

Whereas a few years ago flocks of 200 Buff Leghorn pullets would present all colors of the rainbow, today we are getting them an even, soft shade of beauti-

ful buff. The many shades of buff, with black and white in different sections, used to be a great objection in past years to any utility flock, but now that has been done away with by careful and judicious mating.

The Buff Leghorn originated in Denmark, and was exhibited for the first time in this country at New Haven, Conn., in 1869 by John G. North and C. P. Nettleton of Shelton, Conn. In 1871 C. E. Clinton, who was Secretary of the Connecticut Poultry Association, exhibited a string of Buff Leghorns at New Haven. They were smaller than the Buffs of today, and of fair color and type. The first Buffs to be shown in Madison Square Garden was in 1891, by August D. Arnold. They were coarse in comb and heavy in body. The following year Mr. Arnold exhibited some good specimens, which he bought of Mrs. Lester Kay of England. Since then the breeders have been improving the breed in every section, until today we are justly proud of the grand results obtained.

A word concerning mating might not be amiss. Never mate extremes in color, for mealiness will be the result. Try and have your male one-half darker than the female. Avoid coarse combs both in males and females, and never breed from a male showing pronounced white in any section; pepper, or a slight shade of dark is allowed in males Have your male well up in his legs, cull out your short shanked birds. Have both males and females with nice sweep to back, and well spread tails. Avoid all females showing shafting as this is a very bad defect.

The care of the old and young stock is greatly neglected during the year by many fanciers. Buffs should have shade and plenty of it, or you will have faded youngsters when the fall arrives, the same applying to the old stock. If you have no shade, make it. It is easily done by making a frame about three feet from the ground and placing brush or branches on top. Go over your birds for scaly legs. A little care in the fall means much to you when the show season starts. Separate your cockerels as soon as they begin to worry the pullets, and if any very promising youngsters show up, put them in nice shady runs by themselves and nurse them along. When the breeding season is off, take your males out of the pen, and rest them up until the next breeding season arrives. You will find that both the hens and males will be greatly benefited by it. Condition is half the battle in the show room, and the lack of this is strongly demonstrated in every show, the country over.

THE SINGLE COMB BUFF LEGHORN

I have simply put in this article facts which have come under my observation during the past years I have been breading the Buff Leghorn, and during this time I have had other breeds in my plant, but I must say that the Buffs are the money makers from start to finish, and I am sincere when I say that I believe they have been tested and not found wanting, and that they are coming to be one of the most popular breeds in the country.

HOW BEST TO IMPROVE THE UTILITY OF STANDARD BRED POULTRY

***The Mode of Procedure To Bring Standard Bred Poultry To Meet Utility Requirements Are Not Difficult and the Breeder Who Reads the Signs of the Times Correctly Will Be Ready To Reap the Harvest.*--By Prof. W. R. Graham.**

THE increasing demand for what is termed purely utility stock and the diminishing demand of exhibition stock of the second grade suggest that the public at present are considering poultry from a purely economic basis of eggs and meat. There can be no doubt in the mind of any reasonable person but that exhibition poultry has done much for the industry. It is equally true that in some instances at least, the fancy ideals have worked to the injury of the particular breed or strain, perhaps not from the viewpoint that the ideal was, in itself, absolutely antagonistic to the utility qualities of the specimen; but more that the utility qualities were ignored. The crux of the whole situation is that people put forth their best efforts ordinarily along lines which affect their pocketbook.

If we accept the above as true, and consider the prices paid during the past ten years as fair indication of the times, it appears to the writer that the purely fancy points would certainly be well developed. Again, if we take the present inquiry for purely economic poultry, as the indicator at this time we of necessity must expect exceptional demands for hens that lay a large number of eggs. Personally I do not believe either ground is in itself the best one. What is wanted is hens that lay at least an average of twelve dozen eggs, or more eggs that weigh two ounces or better. The eggs must hatch well and the chicks live and grow quickly. The demand is not only for high producers, but producers of good sized eggs. A meaty dressed bird is required, in order to sell the surplus cockerels or the old hen. Last, but not least, the economic point is how many eggs set does it take to represent a pullet ready to lay.

Taking the above into consideration, the question of how best to improve the utility qualities of standard bred poultry is not so difficult, providing we do not change our standards, except in cases where the type now used is absoltuely proven to be inconsistent with the characters required by the utility breeders. It is all very well to talk of high or low tails, wide or narrow barring, etc., but I very much doubt if any one can say positively that these styles in themselves are harmful. It is probably true just at present that few birds of the best utility qualities have these characters.

We shall have to sit down and figure out calmly what is wrong in Rome. We are inclined to get hot under the collar when criticised but one has to learn by hard experience that friendly criticism is good medicine and that each and all of us are not perfect.

The mode of procedure to bring standard bred poultry to meet the utility requirements are not so very difficult and the breeder who reads the signs of the times correctly will be ready for the harvest. Breeders of exhibition birds know the general principles of breeding and selection so well, as an art, if not as to the purely scientific reasons for their results that it would be folly, here to even suggest plans in detail to their breeding operations.

If the breeders will permit the writer to suggest the points in which he has found exhibition poultry to be weak and the same is true in some respects of high layers; the following characters need improvement:

Chickens are a nuisance when lacking in constitution. Robust, healthy specimens with lots of ginger, spunk, or kick to them are wanted. The constitution is the mainspring. Of what use is a very fine watch with a weak main-spring? If the watch will not tick regularly, the time indicated is not reliable; so a bird with low vigor is not reliable. Pass by as breeders some very fine show birds for lack of vigor.

A hen must lay about one hundred eggs a year to pay for her keep. Most people do not like to keep chickens but prefer chickens to help to keep them. That is natural, and who likes his neighbor to get more eggs per hen during the period of low egg production than you are getting? Furthermore, small, badly shaped eggs are a worry, to say the least.

It is not an uncommon phrase to hear that the more you pay for settings of eggs the fewer chickens are hatched. Fanciers are pleased if they get a few good ones, but the farmers want eggs that will hatch a high number of chickens that live. All this means that it would be well to pay more attention to the chicks from hens whose eggs hatch well, and whose chicks live.

Life is short and at this day and age the demand in

nearly all classes of live stock is for quick growing stock. A pullet that begins laying after seven months of age is seldom profitable. This means a selection of birds that grow to good size and mature quickly.

The poultryman of the future who reaps a big harvest will have hardy, rapid growing stock that lay plenty of good sized eggs that hatch well.

In conclusion the writer expects to see shortly, in the advertisements, a special placed on size, color and hatching power of eggs.

AFTER THE WAR, WHAT?

***Prepare Now For the Great Demand; Increase Your Stock. More Good Birds Will Be Wanted This Is the Poultryman's Opportunity.*--By Mr. A. P. Marshall.**

THIS may seem a very difficult subject to write about, but looking at it from the light of a speaker that the writer heard a short time ago it would appear as though it might have less room for correct criticism than something dealing with past events that must be absolutely accurate to bear inspection. At best, any assumption to peer into the future may be far from giving the exact possibilities, but there is no doubt that we must to some extent at least, use our judgment in deciding the best policy to follow to prepare for what may seem to be the likely direction that conditions will follow along the lines in which we may be interested.

It is not the intention in this article to try and give the impression that it is possible to say just what may be expected after this horrible war is over. It is safe to assume, however, that there will be some decided changes in the poultry industry, that there must of necessity arise owing to the stringent conditions evident in every part of the world. Even already it is having a marked effect on the general run of poultry raisers.

The price of feed and the general idea that markets in fancy stock have been to some extent narrowed as compared with other years, has had the effect of causing many small and spasmodic breeders of poultry to sell out or cut down their flocks to the smallest number possible. Birds are being sacrificed that at other times would be held for fairly high prices, and there is a cutting down of inferior birds wherever these can be turned into money.

With the big breeder or market grower we do not believe this is so generally true. Food products will always be in heavy demand and they who can produce for the best markets are having easy sale of all they can produce. Prime market poultry will not be overproduced at any time. In fact we know of several of these who are increasing their production as much as possible this season. The same has been true of a number of big breeders of fancy stock who look for heavy requirements at a later date. With many of them it is a case of getting chickens out of every available egg during the breeding season and perhaps this year there has been opportunity for using a few more than usual.

Now how is this going to affect the poultry industry? We do not believe we are far wrong when we say that whenever conditions begin to right themselves many of these chicken fanciers who have been getting rid of their birds are going to stock up again and will have to look to those who have a supply to furnish them with breeders to replace what they let go at this time. If this is true and the wish to re-enter the ranks takes hold of a great many at the same time as it probably will be able to benelt. If they haven't guessed far from the right mark they will be able to meet a demand that only they can supply.

In letters from other breeders we have evidence that they are planning their operations to take care of this likely condition. One breeder who usually raises about 1,000, is trying to handle 1,500, and another very large producer of prize winning stock has very much increased his brooding plant indicating a very much increased production. In doing this, we do not believe they are taking much chance of losing in any degree for they have the advantage of having a larger number to select choice specimens from and have a large production that can be turned into marketable return in food products no matter if the return to heavy buying of high priced stock should not return as soon as they may expect.

As we look around and see our neighbors and others culling as closely as they possibly can, we feel more and more convinced that this is the time to raise more good birds than ever before. When the time comes we believe there will be a scarcity of almost anything that can be called a good, thoroughbred chicken, and if this is so here what will it be in the devastated countries of Europe, where the war is going on? Does there not seem good possibility that they will come to us for considerable of their re-stocking blood?

The present conditions should prove splendid for training all of us to use careful and result bringing methods to replace any that have had any essence of waste to them. When good buying returns, as it most surely will, the habit of careful production at a sensible cost will prove such as to make the profits much better than with any methods that allowed for any loss by waste or oversight of profit values. Necessity will improve many breeder's methods and teach him where he can raise a profitable flock in stringent times, making it possible when those who have cut down their flocks are again ready to replenish them and buy to continue to produce in the same low cost way and make a larger net profit on the better priced business.

Of all people we do not believe the poultryman has any reason for giving way to flat discouragement, as it seems by viewing the matter in the light of anticipated improvement that must come in a lively way as soon as everything begins to be properly adjusted again. The whole world is looking to the man who can produce something with which the world is to secure its food and who has better claim to a place in that class than the producer of prime poultry.

THE PETALUMA OF THE EAST

***The World's Greatest Poultry Section Close To Its Best Markets. Climate and Soil Ideal. The Poultryman's Paradise.*--By T. F. McGrew.**

PEOPLE have heard and read so much about poultry farming in California that they probably believe there is more poultry grown near Petaluma than anywhere else in the world. In the land of everlasting sunshine where the flowers bloom continually and where there is but little trouble from frost and cold, it is not easy to realize that thousands of laying hens are kept in the mountains of New York and Pennsylvania, where there is frost for five months in the year and where ice twenty-four inches thick was plentiful during the past winter.

Some of the most productive egg farms in the East are located where the thermometer registers from 24 to 26 degrees below zero during the winter months. On the other hand we can turn with pleasure to what are known as the southern districts of New Jersey, which are adjacent to Cape May, Atlantic City, Long Branch and near enough to the ocean to benefit from its modifying influence on the temperature. These districts have much less severe winter weather than is found in the greater part of all the eastern or middle staets.

The district of South Jersey is adjacent to the most profitable markets in all the world in which poultry and poultry products can be sold. Philadelphia, Cape May,

Atlantic City, Asbury Park, Ocean Grove, New York City, Long Branch and Boston are all within twelve hours by express. The location is ideal because there is so little winter weather there as to admit of keeping hens at the least expense. The roads between New York and Philadelphia, passing through this district are so well developed as to make automobiling possible and at a speed fully equal to that of the railroad. By such delivery packages of eggs can be sent quickly to Trenton, and from there distributed by express into every part of the East. Eggs can leave Trenton by express at 6 o'clock in the afternoon and be on the breakfast tables next morning in Philadelphia, New York and Boston.

NATURAL SURROUNDINGS

The scientists of the world have written that the prime necessities for successful poultry growing are (1) a sandy soil, which will drain and cleanse itself and which provides a dry footing and a dusting place for poultry; (2) continual shade and protection from the winds; (3) an even temperature.

The soil in these districts is a sandy loam through which the heaviest rains sink away in a very few hours, carrying away any taint that may have accumulated. This soil is remarkably fertile and large quantities of green forage can be grown upon it, two or three crops of some products being grown each season. Shade trees of the most desirable kinds—pine, and oak, grow luxuriantly.

During the summer months the double protection from the pine and oak provides plentiful shade from the direct rays of the sun. During the winter months the pine trees shield the poultry from winds and storms. The needles shed from the pine trees form a gracious covering for the ground; among these small grains can be thrown and in scratching for their food, the laying hens receive not only the necessary exercise, but the benefits that come from the odor and from breathing air charged with ozone by the action of the pine woods.

The even temperature of that locality makes the growing of chicks throughout the entire season, and is grateful to the hens as well as to those who care for them. The even and moderate temperature prevents the overheating of the poultry houses and serves to diminish to a great extent the strain that must fall upon the poultry kept where the temperature gets up into the nineties and stays there day and night. Persons seeking a pleasant home where the summers are delightful, the springs and falls beautiful and the winters mild, can find few places so delightful as South Jersey.

From Lakewood, New Jersey, to Vineland, New Jersey —From Vineland to Mount Holly, N. J., and from Mount Holly to Lakewood includes a scope of territory that is well suited for poultry, fruits and vegetables. Hammonton N. J., the starting point for the broiler business, is included in this territory—the whole of which is filled with fruit farms, vegetable and potato farms and cranberry bogs, and it is the locality in which more poultry is kept perhaps, than in any one locality in the world.

Those who hope to do the best with poultry must be careful in the selecting of the locality and the land. There should be as careful attention given to the purchase of a farm as to the purchase of a bank or any other large business. First of all, you should decide what kind of farming you prefer; then select the locality and the soil best suited to your purpose. Thus, potatoes and asparagus will not grow well in heavy or damp soil; fruit will do well in some localities—not so well in others. Land that will absorb all the water that falls in it, is usually fertile. Wet or marshy land that can be drained, may be made into valuable farming land. Land that is washed by every rain is not desirable.

The raising of fruit and poultry is a most attractive kind of farming and it is profitable, providing good judgment is displayed in selecting land and location. The land must be well suited for fruit and the location be within twelve (12) hours of a good market. Wherever fruit will grow, poultry will prosper, and there is no kind of live stock that can be made more profitable than poultryfi nor will any kind contribute more to the enrichment of the soil. There are many instances of speedy improvement in lands worn out with over-cropping, or, as now stated, "Land reclaimed," by rearing poultry or ducks upon it.

South Jersey has been to New York City what the little Compton district of Rhode Island and the South Shore districts of Massachusetts have been to Boston. More white-shelled eggs go from Jersey to New York during the winter months than go from any other locality. The brown or tinted eggs preferred in Boston are sent there from the districts named. The lands in the little Compton district and the climate are well suited for fruit, grain and poultry. The lands of Massachusetts are not generally so good, nor is the climate so mild as in the other localities mentioned.

Delaware, Maryland and the Virginias are good for both fruit and poultry, but none of them exceed the advantages of New Jersey, which has the soil, the climate and the natural advantages of market and transportation.

Unoccupied lands are plentiful. Some of them are covered with scrub oak or pine, having an undergrowth of ferns, summer grass or weeds; others are submerged with water, which will protect the cranberry bogs from the frosts of winter or make marshes and swimming pools for geese or ducks in summer. Such lands may be cleared of their trees, drained of their swamps and be transformed into fertile fields, profitable orchards for poultry, but there are market advantages to be considered. These consist largely in prompt transportation to a ready market that will pay the highest prices. Many fail, not because they cannot produce marketable products, but because they are so far distant from the market as to lose the advantage of a quick sale.

To prosper best with poultry, it must be grown where it can be sent to market within ten or twelve hours of killing; that is, so that the product may be sold the day after killing. Eggs should be on sale within twenty-four hours after they have been laid. The wholesale price of nearby fresh-laid white-shelled eggs, is usually from ten to twelve cents a dozen higher in New York market during the winter months, than of any other kind of eggs. This is because they are gathered today, shipped this evening and are on the breakfast table in the morning. The dressed poultry from the South Shore districts of Massachusetts, from the little Compton districts; from Connecticut and Long Island and from South Jersey, can all of it be on sale in the large cities of the East, within twenty-four hours after killing.

The great advantage of this is that during the winter months it can be killed, dry picked and shipped to market without being cooled with either ice or water. Such poultry goes to market soft and dry and with that bloom of freshness which commands the highest prices. Such poultry sells at reatil in the New York and Boston markets at from thirty-six to forty cents per pound.

The Philadelphia roasters that have been famous for good quality, are grown in New Jersey. The Rhode Island turkeys are known the world over for their excellent flavor, the capons of Burlington county, New Jersey and of the South Shore districts of Massachusetts, and the broiler ducks from many localities, are all highly prized because of their excellent quality. They have all of them been well bred, well fed and killed just when best finished for market. All of them are grown on lands and in localities favorable to them and in close proximity to a good market.

Lands that are damp or with heavy clay soil that will neither drain nor dry out quickly are not well suited for poultry. Lands that drain well thrugh an open sub-soil are the best. Sandy top and sub-soil is excellent, for it will not only dry out quickly after heavy rains, but contaminating matter will be washed into the depths of the soil, where it is absorbed and enriches the ground.

ED. NOTE.—Mr. T. F. McGrew requires no special introduction to poultrymen. As a breeder, judge, lecturer and author, he has devoted his life's work to poultry and its interests. We hope the readers of Everybodys will be favored with more from his pen. Mr. McGrew is now principal of the School of Poultry Husbandry, Scranton Pa.

TODAY will never return. Nothing exceeds time in value. Its loss is waste of some opportunity. To-day, like every other day, we urge you to your greatest efforts. Everybodys seeks to earn a place in your life and a part of your time. Its reading will be to your advantage, Recommend it to your friends.

When Writing Advertisers Always Mention "Everybodys"

OUR GUARANTEE.

We guarantee every subscriber against loss due to fraudulent misrepresentation in any display advertisement appearing in Everybody's Poultry Magazine providing the subscriber when ordering th fowls or merchandise states that the advertisement was seen in Everybodys Poultry Magazine and places the order during the month or months in which the ad is inserted in our columns and notifies us of the fraudulent misrepresentation of the advertiser, giving full particulars, as soon as it comes.

SUBSCRIPTION PRICE.

Fifty cents the year. Three years for $1 in U. S. and Mexico. Canada 25 cents per year extra. Foreign countries 50 cents extra.

A Renewal Blank will be inserted when sub. expires.

ADVERTISING RATES ON APPLICATION.
SAMPLE COPIES sent free to all interested. Subscription agents wanted.

Manuscript and copy for change of advertisement must be in our hands promptly by the 10th of the Month preceeding date of issue. New business can be accepted to the 20th but no special position can be assured.

In poultry keeping, CLEANLINESS, is of supreme importance that it is one of the fundamental principles of success cannot be doubted, where Cleanliness is practiced, disease is almost unknown, this in itself is the whole secret of profitable stock or poultry keeping. The absence of the condition of health, in which all the organs of the body fail to work harmoniously results in incapacity of some kind, while in poultry in particular it must be admitted that but slight structural and functional deviations from the state of robust health is noticeable quickly.

CLEANLINESS applies alike to the housing, yarding, feeding and to all general conditions, when the conditions are about right and quite natural, when the fowls can work, dig and dust, and where overcrowding is avoided, poultry will take pretty good care of itself, keep in health and condition and make ample returns for all extra care given. CLEANLINESS pays in a thousand and one ways.

H. P. S.

It is advisable to keep a correct record of your poultry business and interests, a strict account of your receipts and expenditures so that you may know in a general way at least the results at any time is advisable.

No doubt the average man will tell you that poultry does not pay, there is nothing in it etc. We have met many such, they are all over, and they are also just the reason why we ask you to keep accounts for your own enlightment. Invariably the man that tells you that poultry does not pay, will tell you the same thing of most any other line of endeavor, he is the kind that is well (?) posted on all matters, still has never really tried, or made a success of any line of work.

Poultry properly kept will return a profit, the amount of this profit will depend largely upon conditions, and wholly upon YOU. To keep a record will also tend to create renewed interest in your stock, it will insure the beginning of business principles and of system in handling, and these will start you right on the road to success.

A properly kept record will also lead you to experiment, by it you will note results daily, if they are not wholly satisfactory you will then know it before serious loss is sustained and change your mode of care and of feeding, your interest will keep your flock at its best while the improved results will follow. We owe it to ourselves to get all we can from our poultry, so let us try, keep a record, and then give to poultry the credit due.

H. P. S.

After having an article in our June issue on—"The Egg Eating Habit" it has been suggested that we also have something of equal worth on—"The Egg Laying Habit." Its a capital suggestion, for Eggs is Eggs year round the production of which is, with some hens a profession, with others a habit and with some few an almost unheard of condition, still there are enough of those who willingly lay enough eggs so that the general average for this country has been increased about twenty-seven per cent during the past ten years.

Hens well handled will in most all cases graduate from the habit to the professional class if given half a chance and where conditions warrant it. You will also note that the best laying and paying flocks, will also prove your best in every other way, in growth, vigor and health.

Urge your hens on to the laying habit by provid-

ing them with the necessaries in food and care and they will bounteously respond as the Egg laying habit is part of their natural make-up. This questions like so many others relating to poultry is really up to you, Mr. Breeder, for if you will do your level best for the hens, they will be at their best to give returns, which you may consider as their habit or profession, will never-the-less be conducive to your entire satisfaction.

H. P. S.

Personally we are naturally fond of standard-bred chickens, and would keep and breed some if they cost us $5, each per year, while our flock would likely be limited under these conditions, it would still have to be large enough to fully satisfy our desires to be known as a breeder and fancier.

But such a condition is entirely foreign to any possibilities we can think of, there is revenue in poultry keeping, and there is also more than one way to obtain revenue, while we are fanciers and willingly contending with many obstacles to keep and to breed fine poultry, like thousands of others, still this revenue idea always appeals to us and "Poultry for Revenue" hould have a special charm for every breeder.

As a source of national wealth a comparison of figures will show that the sum annually derived by our people from the sale of eggs and poultry alone, in as large or larger, then that derived from any other industry, none excepted. With this also should be added upwards of ten more millions for the value that is consumed by the breeders at home.

With poultry the small amount of capital invested is a feature that should be considered in this "Billion Dollar Industry" also consider the labor question that one man can well take care of upwards of 2000 head of stock where arrangements are properly made. In every line excepting that of poultry, these are the two important questions, while here they are really of minor importance.

With thousands of unused acres in every state and in most any section that are well adapted to poultry growing, and with an ever increasing demand for more poultry and eggs at substantial prices, it does not require the expert figures where a ever increasing revenue is to come from.

America pays annually many millions of dollars in gold for imported eggs and poultry, while right here we have the land, the stock the feed, and the climate to fully supply the wants of this and of other nations. We can, if we but try, supply our own needs with a grade and quality superior to what is offered now, and we should be heavy exporters as well.

The breeding of poultry beside offering you profitable revenue, offers pleasant and healthy occupation. I have before stated that—I have never known a failure in poultry breeding, where the breeder really tried, we want all to try, we want a little more willingness for work and more ambition to utilize all our opportunities.

H. P. S.

"Fortune smiles on those who try, "Luck to us means absolutely nothing, it has no share in our make-up and it does not concern us for the simple reason that we have never known where it really brought money or favor to any man or woman. Where you note any special progress, rest assured that back of all that advancement will be found plenty of hard work, successfully accomplished and that it is well deserved. We often hear our great breeders, and the successful persons in general referred to as "Lucky Men" to hear some talk one would suppose that they all, without exception fell into a mire of luck, that they could not avoid the shower of gold, and that their success was really forced upon them.

Nothing was ever further from the truth than this idea and as far as it relates to our breeders it is almost too absurd to consider, they have won their success by effort and not one among them owe success to chance results in breeding or to any condition beyond their own ambition and the fact that they labored and tried to succeed with study and work, we can point with special pride to our great number of successful breeders, and you will not find one in the long list that has not reached his position by his own honest endeavors, and that besides their years of labor there is study, experimenting with ambition to succeed back of every one of them. When a breeder has made a successful mating, one that produced the superior quality that brought him fame and fortune, those matings were not made by chance or luck, they were thought-out and planned for months and perhaps years before the results wished for were attained.

We respect and honor our successful women and men for their accomplishments and we all owe them much be assured that thy did not figure with or depend upon "Luck" they simply did their work well, better than the average did, that is the only secret to their success. Let those who still believe that luck has its special part in breeding, depend upon it if they wish to while we will bank heavily upon the breeder who always realizes things as they are, who tries more ways than one, who keeps at it and whose personal interest and pride is back of his desire to win a name and the honors as well. Shake thoughts of luck and envy for the successful, honor them and try, try as they did, and you too will succeed.

There are greater opportunities for success today, then ever before.

H. P. S.

Quality should ever have due consideration in the breeding and the growing of poultry, and while we are pleased to note the improvements made during the past years, there is still chance for improvement all along these lines. It is the breeders due to obtain the best prices possible for his produce, therefore, let him well consider the importance of "QUALITY" for only the best and select articles will demand the highest and best prices.

In poultry we believe there is but little real difference in the quality of the meat of the several va-

rieties, while its color may in some localities effect the price to a slight extent. "Rastus Johnson" once said—"All poultry has merits" and we believe with Rastus in this and so do the public in a more or less general way. There is no better meat known, none more handy to the average family, and none that can be prepared in more different tasty ways.

Only a small per cent of our poultry growers raise Standard-bred poultry, while probably less than fifty per cent breed a good "Grade" line of stock, the rest have a conglommeration of just chickens, with all sizes, shapes and colors, which cannot under any possible condition warrant those breeders to expect any more than a first offer in price, and that price usually is all they are worth.

It would cost the grower no more to raise a high grade of stock than it does to raise these scrubs, the first cost would be but a trifle to compare with the future results. In marketing Standard-bred stock there would be evenness in color of meat, grain and price received would be the highest the market affords. Keep but one variety, select that one according to your taste and requirements, raise them the best you can, and then the results will best satisfy you.

H. P. S.

"There is so much bad in the best of us, and so much good in the worst of us, that it hardly behooves any of us to talk about the rest of us." When Stevenson penned these words in his far off island home of the South Seas, he gave expression to a truth so deep that it would have caused his name to live for ages, even without his other charming works. The lesson is one we may all well take to heart.

The spirit of hostile criticism, is too rampant in our poultry world, and has been from the beginning. When the American Poultry Association was in its swaddling clothes, men reputed to be "broad minded," flayed it with verbal knouts. But its purpose was right, its organizers stout of heart, and to-day, now that it is powerful, its former castigators are "loyal" supporters and fawningly seek favors at its hands. More recently, a social organization, the Fleas, came in for similar harsh treatment at the hands of many non-members and self appointed critics who in most cases spoke whereof they knew not. To-day, after the forgivable mistakes of organization work have been corrected and the body placed on a permanent and commendable basis, many of its erstwhile critics are insinuating their ways into its fold and council.

Just criticism by individuals or the press, is proper, desirable and right, but when actuated by ignorance, personal motives, or with an idea of destruction, it is unwarranted, indefensible, and cannot be condemned in words too strong.

MacCaulay said, "The opinion of the great body of the reading public is very materially influenced, even by the unsupported assertions of those who assume a right to criticise." The truth of such a statement is self-evident and opens up at the same time a new phase of the subject. Every true editor is more or less of a public character and servant in whom has been placed a sacred trust and obligation. He can be guilty of no more dispicable and unmanly crime than a breach of this trust placed in him by his readers and on the fruits whereof he lives. Yet that crime in its basest and truest form can be rightly charged to every editor who misinforms his readers. He may try to plead ignorance or misinformation, but useless is this plea for one whose efficiency and sole value lies in his having correct knowledge. Again he may be actuated by personal motives, jealousies, desire for gain through sensationalism or numerous other grounds, all equally base and intolerable in a true shepherd of intelligent public opinion.

There has been, is and probably always will be, although we trust in decreasing amount, too much unwarranted criticism in our poultry industry. The American Poultry Association, social organizations, new shows, judges, exhibitors, every ramification of the work, has been too often hampered by improper criticisms and "knocks". There is a suspicion not without some grounds, that printed criticism is often done for self-advertising or space filling purposes, but that is no excuse. Our plea is for proper criticism which is a tonic and purifying fire; our plaint against the eternal "Knocking" in the poultry press and among poultrymen. We will be frank to say that we believe more of the blame lies with the press, as during the greater part of the year, it is the average poultrymans source of information on poultry affairs.

We have often thought of the startling effect on many editors and poultrymen, if the wish of Bobby Burns should come to pass. "Oh, would some power the giftie gi'e us, to see oursel's as others see us, it would frae many a blunder free us, and foolish notion. There is an acid test and digested sermon in a few simple words, for those who like the poor, we seem to have with us always, our enemies, the "Knockers".

If there is one good reason why our "billion dollar industry" has today but the recognition and representation usually accorded to a million dollar one, we must first seek it in ourselves. It will be found in the apparent motto of many poultrymen, "Knock, don't boost." So long as this is so, a hundred Napoleons may arise in our work, miracles may come to pass, and the sun reverse its course, and still we will move only slowly and painfully forward.

When, however, we judge wisely, speak advisedly,, seek good as earnestly as the bad, criticize temperately, retire petty jealousies, and putting our shoulders to the wheel recognize that "the greatest personal gain comes through aiding our fellow men", then in truth will we come into our own and the crow of the cock and the cackle of the hen be a sound of might throughout the land.

It would, indeed, be a most happy state, if all in the future when tempted to speak or write hastily, would remember His golden admonition. "Let him among you, who is without sin, cast the first stone."

J. H. W.

Let me call your special attention to our "Prize Subscription Contest" advertised in this issue, and to ask you to consider this carefully. Our main purpose in this offer is two-fold viz—First we want a larger subscription list, a greater circulation and second we wish to obtain this through our friends and subscribers, believing that circulation in this way will prove to be the best obtainable. We want at least 100,000 monthly circulation for no field is too great or too large for "Everybodys".

The prizes we offer are the best instruments that money can buy, these with the other prizes and features offered are freely given in return for your work for us. We give you your choice of poultry books as listed for the first six subscriptions you sent us. We aim to have this contest a feature in which many of our readers and subscribers will join to make it a success and to obtain circulation and a National character for "Everybodys".

WILL YOU HELP US?

Vacation time is now at hand so the Boys and Girls can get busy, earn money and have equal chance with one of the Grand Prizes which will prove a joy forever. There is a field for your work in every section, an opportunity for all and all have an equal chance.

Start today. Now is the time, write for sample copies and blanks, we mail them to you free. Enter this contest and win.

KEEP UP THE GOOD WORK

We would be lax in our duty if we did not thank our readers and friends for the continued stream of subscriptions they are sending us. We appreciate this along with their interest and good will fully, and it will interest all to know that—something over 12,000 subscriptions have been received in this way during the past three months.

We urge all to keep up this good work and to help to make "Everybodys" the popular Poultry Magazine for all, and for all sections.

SECRETARIES

NOTE Our Prize Silver Cup offer is open to all Poultry Associations and to all Specialty Clubs as well. Get in line for this, we have a beautiful cup for you, write today for subscription blanks. Here is your opportunity to help along your associations.

POULTRY CLUBS

In several states poultry clubs are being organized among the farmers. In West Virginia we are told that over 1000 members are now enrolled, Boys and Girls who are now growing chickens. It is a pleasing to note this condition and we hope that this plan will spread and cover every state and section in the U. S.

Every home could materially add to its income if more attention were given to poultry production Poultry means ready cash at all times, that its greater production should be better developed and encouraged as well.

GOOD TIMES AT HAND

On all sides and on every hand are evidences of "Good Times". We are at peace with the world, the depression caused by the European War along with the fear that we may be caught in the mesh has passed, so all we have to do, is to harvest the bumper crops and to sell them for "Gold" to the ready buyers.

The greatest crops in all our great crop history are maturing in our fields, while the conditions and demands insure the best prices for years past, already we hear the cry for help from the west, help to gather the magnificent crops that lead to prosperity in every line. Surely the prospects are such to inspire confidence along the entire width and breadth of our country, and to all its people.

JUST IN EGGS

Hens Presented $700,000,000 To This Country Last Year

To a lot of individuals, not, however, including the hens, it is pleasant to read that the egg crop of the country during the last year amounted to $700,000,000, exceeding the average wheat crop of the last ten years. Particularly elated is the householder who finds on visiting the henery of his accustomed and trusted purveyor of fresh-laid eggs that the price has gone up to 65 cents a dozen.

It may be a cause of pride to the little dominicker hen, which lays an egg a day and goes barefoot, to read that she is one of the greatest and most dependable contributors to the nation's prosperity. Were it not for her, a by-product of agriculture would not be the profitable thing it is. The little dominicker hen is not assertive except on occasion. But she shows full well that her owner would, but for her, be scratching his slow and laborious way about the country behind a spavined horse or two instead of luxuriously progressing in a car smoothly propelled by gasoline.

The farmer of today is not the farmer of a decade ago. Farming is a polite and effeminate occupation compared with the old order. The farmer who now goes to town in a seven-passenger car and has a tennis court on the front lawn, does not face the hard knocks and the narrow life that featured the old order. Existence in the country, with the better roads, the social centers, the telephones and one thing and another, is not what it used to be. The farmer, of course, takes credit for this to himself, pointing to his progressiveness, his improved methods, his increased efficiency, keeping pace with the times. But the little dominicker hen knows all the time that if she once stopped laying for a year there would be a different story to tell.

THE WISDOM OF ANIMALS

A REFERENDUM on the matter of which is the wisest beast among those most familiar to man would probably show the dog in the lead, with the monkey making a close race and the horse third. Yet there are persons who maintain that the monkey gets credit for thinking like a man a great deal oftener than he really does.

The dog has human morals, therefore people are apt to assume that he has human logic. But the cat, say certain persons, in sheer brains stands next to man. He has the adaptive intelligence that makes him equally at home in the parlor or wildwoods, and gets him a living anywhere. A cat, it is argued, can think faster and take care of himself under more different conditions than any living thing except man. At any rate, dog, cat, horse and monkey among them would take all the scattering vote.

Science has held nearly the same view. When creatures have been taken into a psychological laboratory and put through tests under a stop watch it has commonly been pretty much a dead heat between cat, dog and monkey. The horse proves to be hopelessly outclassed. He can be taught anything, just because he is too stupid to have any ideas of his own. Like many a human prize pupil, he can learn but cannot think.

THE WEALTHIEST NATION

The federal census bureau has completed its estimated valuation of the wealth of the United States, compiled from the returns for 1912. The grand total is $187,739,071,090. compared to $107,104,212,000 for 1904.

The largest returns for the other leading nations, as reported by the bureau of foreign and domestic commerce are: Great Britain and Ireland, $85,000,000,000; Austria-Hun-

gary, $25,000,000,000 and Italy, $20,000,000,000.

The census authorities have made a classification by state groups under the headings.

The reported wealth of these groups is as follows:

New England	$11,805,422,012
Middle Atlantic	46,211,667,778
East North Central	39,502,313,524
West North Central	31.208,417,942
Southern Atlantic	14,843,953,211
East Southern Central	7,660,040736
West Southern Central	15,434,960,541
Mountain	6,753,014,062
Pacific	13,626,919,363

The twelve wealthiest states are: New York,, $25,011,105,223; Illinois, $15,484,450,232; Pennsylvania, $15,457,530,277; Ohio, $8,908,432,943; California, $8,464,204,277; Iowa, $7,868,454,211; Texas, $6,859,969,1[illegible]; Massachusetts, $6,302,988,392; Missouri, $5,842,017,009; New Jersey. $5,743,032,278; Minnesota, $5,547,327,017; Michigan, $5,427,022,651.

JULY

A few of the prominent events and happenings during the month of July in the past are recorded below:

July 1, 1898—Battle of El Caney by General Shafter.
2, 1881—Assassnation of Garfield by Guiteau.
3, 1898—Cevera's fleet destroyed.
4, 1776—Independence Day.
6, 1747—John Paul Jones born.
7, 1898—Hawaii annexed to United States.
8, 1758—Battle of Ticonderoga
9, 1860—Christians massaared by Mohamedans at Damascus.
11, 1804—The Burr-Hamilton Duel.
13 1832—Source of the Mississippi discovered.
14, 1789—Revolution begins in France.
16, 1864—Highest premium on gold, 285 per cent.
18, 1878—Epidemic of yellow fever in the South.
20, 1203—The crusaders in Constantinople.
21,1796—Death of Robert Burns.
24, 1500—Vincent Pinzon discovered Amazon River.
25, 1881—Smokeless powder first used in U. S.
26, 1565—St. Augustine, oldest city in U. S. settled.
28, 1887—Gold discovered at Silver Bay, Alaska.
29, 1291—Switzerland, the oldest existing republic, was established.
30, 1619—First Colonial assembly, Jamestown, Va.
31, 1790—First mechanical patent issued.

If you cannot enter our Prize Subscription Contest, ask some of your neighbors to enter. Somebody is going to win these grand Columbia Grafanolas, and it may be you. Try for them.

NOTICE

Secretaries

We want every poultry association with their show dates listed in our columns. Do this now, write us today, for it may be the means of getting additional entries for you. Kindly send us all particulars, with the secretary's name and address, judges names, etc. We wish a good live representative at every show held to take subscriptions. Here is the opportunity to earn real money real easy, for subscrptions for "Everybodys" are easy to get.

Specialty Clubs

We publish a list of all specialty clubs with the secretary's address under proper Classified Advertisement headings. See if your club is properly listed in this issue, if not advise us, for we are anxious to have this correct and complete.

Prize Silver Cups

Note elsewhere in this issue our offer of large and handsome silver prize cups we give FREE for twenty-five yearly subscriptions. We offer these cups to every poultry association to be awarded as a special prize at their show. Also one to every specialty club to be awarded at the how they select.

Get Busy Now

We wish to make this a general and popular offer, every association in the country can have one of these cups; they are large and valuable, of new design and high grade in every way. Here is a prize worth competing for, one that will insure a greater entry and strong competition.

"Everybodys"

Is a Poultry Magazine of National character, it belongs to and is appropriate for every section and will prove a welcome visitor in every home. Start right now, and earn one of these special cups for your association, every member and every breeder will appreciate this. Write today for subscription blanks. Always address, Everybodys Poultry Magazine Pub., Co.,
Hanover, Pa.

THE OBJECT OF FEEDING

Both old and young fowls require plenty of nutritious food to keep them in a satisfied condition and always thrifty. The object of feeding well is to increase size as rapidly as is possble and to furnish the proper nutriment for the laying hens. With the young the rapid growth of the body, bone and feathers is a drain to supply these with good healthy growth and strong constitution, we must have resource to a proper supply of food during the period of growth, and during the season when the greatest number of eggs are desired.

JUDGE BEN S. MYERS

Mr. Ben S. Myers died at his home at Crawardsville, Ind., May 10th. Mr. Myers was one of our most prominent breeders of Black Langshans and a judge of national reputation. As a breeder of Black Langshans he was best known, having bred them for nearly 40 years.

For all the years we have konwn Mr. Myers we have respected him, his interest, with love for the fancy was great, he was never found wanting a true champion of better poultry all the time.

We deeply sympathize with his family.

GET THE HAPPIEST HABIT

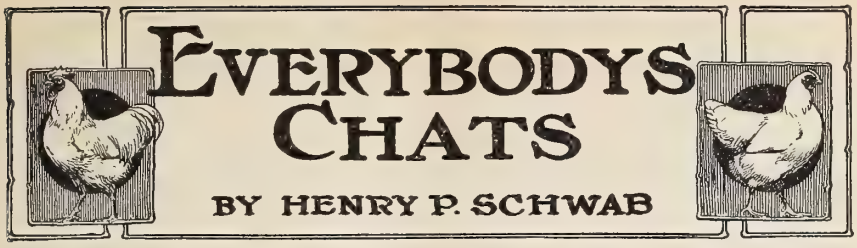
MEN and women should make it a part of their daily walk to put much joy and little bitterness into the lives of those about them. It is a joy induced to come into contact with sweet-spirited men and women—people who care for their fellows and companions, who wish to spend a better day among them. There is plenty of room for improvement. There are far too many, who, loaded down with the cares of life, go about crabbed--thoughtlessly tramping upon toes of those about them, casting firebrands among those about them, saying and doing little things which hurt, more perhaps in the long run, the perpetrators, but doing injury just the same. This can be changed, and with no great effort. Get the habit. It is the little things that count, and if on the other side of helpfulness the world would be changed ere the influence causing it could be recognized.

Summer Sale

You can now purchase at special prices breeders from our splendid pens of the past season. We must make room for our superb young stock —finer than ever before. Send for summer sale list—it will give you some bargains too good to pass over.

SUNSWICK FARM S. C. BUFF ORPINGTONS have this season exceeded their past records in prizes and eggs. Through 11 years of line breeding they have acquired the great size, stamina, beauty and early maturity that now distinguishes them. Our breeders are in splendid conditon—the young stock superb. Order now. Get the pick. Send today for our new illustrated catalogue and mating list, also summer sale list. All free. Write promptly.

SUNSWICK POULTRY FARM,
Rufus Delafield, Owner
Box F, SOUTH PLAINFIELD, NEW JERSEY.



While we celebrate let's hope for universal peace.

* * *

Be awake to conditions, keep busy in the poulty yard, both old and young require a little extra attention at this time.

* * *

Weather conditions have been very changeable this season, which resuires an extra amount of care, still care always pays well for itself.

* * *

Don't shirk a duty but go and do it when first noticed, do it right and it won't have to be done again. It does not pay to think unless you intend to act.

* * *

Everybody is still booming "Everybodys," and subscriptions are coming in at a lively rate, most of then on the recommendation of subscribers. Keep it up, friends, we are with you for a popular magazine ever.

* * *

Do you like our July style Well, we have more good things in store for "Our Folks" in the coming months we are in to make good, and we will, too, with the aid of our thousands of appreciative friends.

* * *

Discipline—A British soldier in Belgium was one morning wending his way to camp with a fine rooster in his arms, when he was stopped by his colonel to know if he had been stealing chickens. "No, Colonel," was the reply. I saw the old fellow sitting on the wall, and I ordered him to crow for England, and he wouldn't, so I just took him prisoner."

* * *

Caponizing is becoming more popular than ever, we advise this, and particularly if you are located within reach of an appreciative market.

* * *

Have a reason for everything you do, and how you do it, also try other ways, observe and learn. Many wee little things may mean great big dollars to you in time.

* * *

First Boy—"My father's been everywhere."

Second Boy—"Has he been to Heaven?"

First Boy—'Well, no. But he's been to every place of more than five thousand population."

* * *

Congressman Kitchin wants a special session of Congress to begin in September. Senator Lewis wants it to begin in October. The people don't want it at all.

There is special value in breeding from two year old hens. A specimen that will show good quality at that age surely has quality in them to reproduce and to transmit, they are the most dependable breeders.

* * *

It is said that there are now 400.000 words in the English language. That ought to enable most everybody to express his opinion on the European war.

* * *

Where, oh where, is that 1915 Standard?

* * *

With over a billion dollars favorable balance, the United States is the preferred creditor of the world.

* * *

Orchards afford ideal runs for fowls, they will destroy the insects that bore under the bark and damage the trees.

* * *

With the 1915 A. P. A. meeting still ahead of us, we already note mention of Detroit and Cleveland for the 1916 meeting. Either of these cities would by their location make an ideal meeting place, with a very large convention assured. It does seem as if Detroit had claims upon this 1916 meeting, she has gallantly taken several defeats.

* * *

One of our exchanges asks—Why not call them hay widows? Hay is grass with the greenness squeezed out.

* * *

Perhaps you will expect to find some article in this issue that is missing, if so, write us about it. We have a complete staff of correspondents and will be pleased to refer to some of them the task of supplying articles on any general subject.

The general outlook as regards poultry is very encouraging, there is a large growing stock of quality throughout the country with prices firm. The breeders are reporting many inquiries, with sales ahead of last season, so the future looks particularly bright.

* * *

Eggs for hatching, have made a grand come-back this season, from notes on this we have every reason to believe that twice as many eggs were sold for hatching this spring as was sold last year, or the year before This, with good hatches common means plenty of quality at all the shows.

* * *

We have a special offer for every Poultry Association and Specialty Club to accept. Note ad in this issue and write for subscription blanks. One of these grand cups will help to increase your entry. Do this now.

* * *

A Washington physician says that men would be healthier if they would eat dinner in the middle of the day, taking two hours off for the meal. Probably most of us would be willing to do it if the boss would let us.

* * *

Swat the rooster if you don't intend to breed him again, and don't think of using him again if you can get a better one.

* * *

Do not expect too much of your fowls at this time of the year, don't force them; feed regularly and they will come around nicely, ready with a most generous supply this fall and winter when prices are high.

* * *

Editor Drevenstedt in the American Fancier hands out weekly a rare lot of "Good Stuff" in his usual way. There is more real "Grist" in some of his columns than in some big books we have read.

* * *

We want to thank the unknown friend who sent us a copy of the constitution and by-laws, together with the proceedings of the meeting of the A. P. A. at Buffalo, 1874. It is a neat little booklet we shall always prize highly.

REGAL SUMMER SALE

In order to make room for my large flock of rapidly growing chicks I am offering for sale 500 selected breeders at remarkably low prices. Send for free sale list giving description and prices; also 20-page catalogue. Eggs from prize matings, $2.50 per 15, $4.50 per 30, $6.00 per 45, $12.00 per 100.

Regal Cockerels and Pullets

This season I have over 1,000 early chicks, the best I ever owned. If you want to make a winning in your State Fair let me quote you prices.

JOHN S. MARTIN : : Box D : : PORT DOVER, Canada

RILEY'S BARRED ROCKS

I have some of the greatest youngsters growing that I have ever seen, and it will be to your advantage to write me early for your winners.

HENRY D. RILEY Box C STRAFFORD, CHESTER COUNTY. PA.

Are you keeping them growing?

We want agents to take subscriptions for "Everybodys" east, west, north and south, write for terms and information.

Care of the Breeding Stock During the Summer

Fall and Winter Eggs Depend Largely Upon the Care and Handling of the Breeders; Fertility Is Also Aided--By E. M. Long.

After the hatching season is over, it is a good plan to give the breeding stock some rest and relaxation. I believe for best results, every good hen should raise a cutch of chicks each season. The three weeks of incubation is a sort of partial fast and rest period for the hen. The following weeks of brooding act as a sort of tonic to the hen, usually starting the feathers for an early moult and putting the hen in a condition of health and vigor that means eggs during the fall and winter. Then the different care and surroundings are to the hen what a vacation is to the man who spends the balance of the year hard at work. If impracticable to set the hen, then it is a good plan to put them on range. This will prepare them for a winter of usefulness and keep them in a condition of health that will mean strong hatchable eggs and likewise chicks of the same kind the following season. It will also give them a better chance of coming through the moult with a good, even, lustrous coat of feathers. Good health and proper surroundings mean exhibition condition at the end of the year. Stock must be in good condition of health and feather if we wish to win with them in the fall and winter shows and also if we wish to sell them to others for the same purpose.

It is something of a question to handle the males that have been at the head of breeding pens. I find little trouble with the surplus males that have been kept together away from the females, but it is an entirely different question to deal with the males that have been running with the females. It is almost necessary to coop these birds singly. Not all of the smaller breeders are so situated that they can do this. After the pens are broken up I sometimes put these males with a bunch of cockerels for the balance of the season. Occasionly I prefer to leave an exceptionally good male with a few hens, as I believe they are apt to keep in a better state of health when kept in this manner, than when cooped up alone. Late in the season it is advisable to coop the best of the males birds up where they can be kept from the sun and rain, especially the hot sun of midday which burns the lustre out of the new feathers. No matter what variety or color, or whether male or female, a bird that is kept under sanitary conditions, with correct feed and water and protection from vermin, will moult out in a much more satisfactory condition, when kept out of the rain and out of the rays of the sun during the midday; say from 9 a. m., until 4 or 5 p. m.

If there are some exceptional birds wanted for early fall exhibit it will require special attention to put them into the best of shape. Quite often it is necessary to take some method of forcing the moult. I known of nothing that is natural and sure for the female than sitting and raising a brood of chicks as mentioned above. The males may be fed very sparingly for two or three weeks on wheat screenings or some light feed, just enough to keep them in fair shape; allowing them to run down in flesh. Then start in gradually with a rich ration, that is rich in protein and feather building materials, increasing it until they are receiving a heavy ration. This will usually start the old feathers. It is usually advisable to pull the stiff wing and tail feathers and sometimes the sickles, so that they will come in evenly and without hindrance. Old feathers are sometimes like the first set of teeth in children. If not removed, they will hinder the proper development of the new ones. They should be removed, however, in sufficient time to allow at least half development and if possible two thrids development at time of exhibition. It don't look good to me to see a bird with tail featers an inch or less than an inch long. It is not the natural condition and tends to place the bird in a position so that they represent acertain type or symetry that they do not possess. Four things are necessary if we would have a bird at their best, both in exhibition and health. These are proper feed, pure water, absolute cleanliness, and freedom from lice and vermin. In addition to these birds for exhibition should have protection from the sun and rain. It is not only too early to begin conditioning our stock for the fall fairs and the early State Fairs.

NOTES and COMMENTS

BY H·P·SCHWAB

GOING to build? Now is the time to plan and to build the houses you will require for housing your stock this winter. Don't put this off until the rainy season comes, build during the dry weather, select a high spot to insure dryness. We like the open-front shed roofed house pretty well for all purposes, providing the depth is 14 or more feet.

* * *

The express companies have petitioned the Interstate Commerce Commission to be allowed to increase their rates three and one-half per cent., claiming that during the first ten months of the operation of the new rates they had a deficit of over $2,000,000. We are inclined to think however, that the Parcels Post had something to do with that deficit.

* * *

We have just learned with deep regret of the death of Mr. B. S. Davis, Charlotte, N. C. Mr. Davis was for many years one of the best known poultrymen in the South, an ardent fancier and breeder of Barred Plymouth Rocks, and vice president of the club for several years. Mr. Davis was always active in poultry work and a leader in his section, for many years president of the Charlotte Association where some of the largest and most successful shows we have attended in the South were held. We had known Mr. Davis for more than 15 years, knowing his true worth we regret more than we can tell, his loss.

* * *

One of our most welcome visitors is "Our Dumb Animals," a monthly magazine issued at Boston, Mass., by the Massachusets Society for the Prevention of Cruelty to Animals. It is a grandly illustrated magazine of merit.

* * *

Keep the chicks growing, many breeders become careless about this season of the year and neglect their chicks after they have them fairly well started. This is rather a serious error, and while you may not own up to it, you will surely regret it later. To attain the most desirable results feed liberally a variety of wholesome food, supply plenty of fresh, clean water and proper housing, avoid over-crowding and fight lice.

* * *

There is but one Harry H. Collier, note his remarks in this issue, if he keeps on and pleads in that masterly manner he will have the entire population of the East planted out there from Frisco to Tacoma.

* * *

The Chicago Breeders' Show will be held at Chicago, Ill., January 13th to 19th, 1916. This promises to be one of the big events of the season. They have a grand lot of judges which should insure for them a record entry. For information address Mr. D. E. Hale, Secretary, No. 123 W. Madison St., Chicago, Ill.

* * *

We note that Mr. Robert H. Essex intends issuing a Poultry Journal from Hamilton, Ont., and we wish him every success. Mr. Essex has lived many years in the States and we are sure to miss him. His active work here has always been of the feature class. We wish him every success and hope his work in Canada will be as highly appreciated as his work has been and is appreciated here.

* * *

Every reader will want to go over this issue carefully and read every article in it. There is something for all, for the whole family.

* * *

We were pleased to attend a meeting of the York, Pa., Poultry Association. Dates for their next show were set and a plan adopted to raise a guaranteed fund. The meeting was very largely attended with the sentiment evident that insures for them a successful show.

* * *

Animals in sickness are like the rest of us. Some are patient, responsive, uncomplaining and apparently grateful. Others fretful, cross and difficult to manage. For the same service rendered one will lick your hand, and another bite it. They are almost human.

* * *

We can get for you, at a special club rate with this magazine, any Poultry, Farm or Livestock book that you may wish. Let us know your wants and they will have our best care.

* * *

That the breeders in general are very enthusiastic over the quality of stock they have bred this season is rather evident by the letters they are writing us. We hope their predictions will materialize, with all we expect to again see an improved quality at the shows this season.

* * *

Don't overlook the Owen Farms special sale offering for June and July. Mr. Delano is offering a good share of his breeders at greatly reduced prices. This includes his White and Buff Orpingtons, White Wyandottes, S. C. Reds and S. C. White Leghorns. If interested in breeding stock of worth, write him.

* * *

For many years the Fanciers Association of Indiana have held large excellent exhibits at Indianapolis. This is one of the great shows of mid-west, and one that should attract many of the eastern breeders. Thier next show will be held the week of February 7 to 11, 1916. Mr. C. R. Milhouse, Indianapolis, Ind. is the secretary. He will be glad to give any desired information; write him.

* * *

Charc-oil, manufactured by the King Remedy Company, 21 Elm St., Rochester, N. Y., is a Medicated Charcoal that has given splendid results to those who have used it. It is particularly valuable at this time as it both prevents and cures white diarrhoea, indigestion, constipation, etc., it regulates all digestive functions. We have been personally told of its value by users and advise our readers to investigate and to try this preparation.

* * *

The Tri-State Fair will be held at Trenton, N. J., September 27 to October 1, 1915. This is one of the great fairs of the east where the poultry display is a feature exhibit. They have a fine, large poultry building, Empire coops and offer liberal money and many special prizes. Mr. Harvey E. Rogers is the superintendent of poultry. Write for premium list.

SEASONABLE SUGGESTIONS AND HELPFUL HINTS

WHEN July days arrive the strenuous work with the young stock is practically over. There is no more heat to keep going and they have outgrown the five meals a day, so about all that is essential now is to keep them well supplied with food and water and close the houses safely at night. Every chick has its liberty and seems to enjoy it to its full limit. Free range and plenty of nourishing food make strong hea'thy chicks which quickly grow into profit, They have their breakfast and supper carried to them, but dinner and lunch (whenever desired) is supplied from hoppers, which are kept filled with dry mash and which are opened at noon when a fresh supply of water or sour milk is carried to them, and they are left open from noon until supper time, when grain is again carried to them. It certainly makes a pretty sight when about two thousand of them, pure white with bright red bonnets, gather around in the proximity of the colony houses, and wait for supper. They all come to meet the pails and will trail along from house to house until the 14 acre lot in which the houses are placed are literally alive with the white moving pictures. Passersby often stop and watch them and we enjoy the sight as much as any, but it is quite different matter when the grain bills are paid. They certainly do consume a great deal of money every day but it is the same with any business; it is not all profit, nor is it all pleasure, and it is very true that "Nothing comes without labor,' which is the slogan of the George Junior Republic, which is only a short distance from us.

We have been shipping broilers, which are the surplus cockerels, and which should be disposed of as soon as they reach the right weight, which for us is about one and one-half pounds each. The market now pays 35 cents per pound, which is more than will be paid soon; so it behooves us to get busy and select those birds which we can see at a glance will never be good breeders, or birds which we do not need to use for breeders. They will net as much now as they will next fall, when the price is not over fifteen cents per pound, even though they may weigh twice as much then. The extra price in the market, the grain consumed, to say nothing of the labor and house room, makes it much more profitable to dispose of them as soon as possible.

You will find that the pullets will develop much better without the unwelcome attentions of the cockerels, If you do not care to dispose of them now they should at least be separated from the pullets, they are so annoying that it is simply impossible for pullets to grow as they should and would without them.

One can fairly see them grow from day to day now. It is hard work to keep track of them. They lie around in the shade during the heat of the day and wallow in the dirt and thrive and grow to our entire satisfaction. They have the perches up full height now, so that they get the benefit of the fresh air from the open windows which are only covered by one inch mesh wire netting, except when the storm or strong wind would blow directly upon them, then the muslin frames are closed, as it is not good for them to sleep in a draught, the doors are securely locked every night so as to protect them from all kinds of "varmits," both two-legged and four legged, so they cannot have their liberty in the morning until the doors are opened, which is very early these warm mornings. It makes no difference to the ruler of this place, how alluring the engagement may be for the evening, there is "nothing doing" as the children say, until the chicks are safely locked in for the night and it does seem, sometimes, as if they never would go in. He learned his lesson some years ago when a skunk called one evening and maliciously killed nearly one hundred half grown chicks. The evening was very warm and the doors were left open until we should return from a meeting of the Grange. When we went to close the door upon our return we found chicks strewn around promiscuously, very few were eaten at all, just killed for the fun of the thing, it seemed. The next night madame skunk, herself, fell a victim to a steel trap baited with one of her victims of the the night before. A skunk or weasel or even a common barn rat will work no end of havoc in a flock of chicks in a short time, so it is well worth the trouble of securely locking them in. The attention should not all be lavished upon the youngsters now. The flock of adults must not be neglected, they are striving to outdo themselves in filling the egg baskets and therefore deserve extra good food and care, of course, the care is not very much these days. They simply demand timely meals and plenty of fresh water; do not stint them on water, remember that an egg is composed of seventy per cent. of water, and what is cheaper? It is reported that storages are filled to their capacity and still the price of eggs is very good for this time of year. On account of the shortage of early chicks there will be a good demand for yearlings and two-year-olds, to

"HOMESTEAD"
SILVER CAMPINES
The Vigorous Strain

Win at Boston 1915, thirteen regular prizes, including four firsts, specials for best display, best cock, hen, cockerel and best pen. Three firsts and many regular prizes at Springfield, 1914, also at other shows our winnings were equally good. In addition to their blue ribbon reputation our VIGOROUS STRAIN has an established reputation for stamina, vigor, early maturity and heavy laying that makes them most desirable. We can furnish stock that should win at any show in the country.

Our aim is full value, quality and satisfaction.

Mr. J. W. McGinnis, Mgr.
SANDY LICK POULTRY FARM
966 Liberty Street, Pittsburg, Pa.

furnish the eggs for the fall trade; so if we are all wise we will care for them so that they will be ready to fill such orders. We shall dispose of about 500, which are used for breeders, but would prefer to keep them were it possible to provide house room for all of the young stock. Reserve the best of your flock for breeders for another season, even though they will be boarders when eggs are almost golden. They will give you strong fertile eggs and are worth much more than pullets for this purpose. We are anticipating a visit to the exposition this fall and not the least of the expected pleasures is the visits which we shall make to the leading poultrymen throughout the West. We shall be interested to see the different methods employed, and the difference which climatic conditions make necessary in their care and food.

We have been disappointed in not receiving as ready a response as we had hoped for to our invitation to housekeepers to help us with helpful hints. Every one learns some easy manner of accomplishing some desired results in this art of home making, and it is only neighborly to be willing to pass it on. You may have thought that the invitation was given through politeness, but we wish to assure you that it was a hearty and cordial invitation to you to "Help ye one another;" so please give us the benefit of any trick you may have learned which will be a help to another sister.

HELPFUL HINTS

In stirring thickening for gravy or soup use a silver fork, you will be surprised to find how quickly and smoothly it can be mixed.

When you are washing fine china or cut glass, it is a good thing to place a turkish towel at the bottom of the pan; this will lessen the danger of the glass or china becoming cracked or nicked.

Many weary steps can be saved by providing the kitchen table with castors, so that it can be moved from place to place, in dishwashing it can be near the sink, in fruit canning near the stove, etc.

If iodine is spilled on linen or cotton, pour boiling hot starch over the stain; repeat twice within an hour if necessary, when it will be found that the stain will disappear.

A Cleaning Hint—Mix gasoline with flour to form a thick paste, rub this paste well into the garment to be cleaned, then hang onto the line to dry. After gasoline has evaporated brush out the flour with a stiff brush and the spot will have disappeared.

When the metal tip comes off from shoe lacings wind the end firmly and closely with black thread, then sew repeatedly and the string will work as good as new.

Canning Cherries by the Syrup Method—This is the easiest and best method for canning cherries. Wash the fruit carefully and remove the pits, and drop the cherries at once into jars that have been sterilized by boiling for twenty minutes; pack the fruit in the jars, place new rubber on can and fill to overflowing with a heavy boiling syrup, and seal at once.

Sun Preserved Cherries—Place the washed and seeded cherries in the preserving kettle with an equal amount of granulated sugar, boil for five minutes. Then place on platter and set in sunshine, and leave sunshine until fruit of syrup is of the consistency of jam, then put the fruit in jelly glasses and cover with parafine, if it is necessary of course to cover platters or trays from insects and dust.

Pickled Cherries—Select cherries with stem attached and place them in jars which have been sterilized; with an alternate layer of powdered sugar until jars are three-fourths full, then fill the jars with cold spiced vinegar and seal at once.

Cherry Tart—Cook two cups of pitted cherries with half a cup of water and one cup of sugar to a rich preserve. Line a pie plate with a good rich crust, pour in the cooked cherries, twist three narrow strips of the pie crust and place across the pie and bake in an oven until done. Serve with whipped cream.

Cherry Pudding.—Two eggs, one cupful of sweet milk, two teaspoonfuls of baking powder and flour enough to make a stiff batter; mix thoroughly and add as many cherries as can be stirred in. Steam one hour or bake one-half hour; serve with sugar and cream.

Now is the Time to Buy Rancocas Prize Birds

In the Rancocas breeding yards are over 100 birds now for sale that have won prizes at such shows as New York State Fair, Philadelphia, Madison Square Garden, Boston, Grand Central Palace, St. Louis, Williamsport, Brockton and New Jersey State Fair.

For the second time in the history of the "Million Egg Farm" we will have a Summer Sale and offer some of our record birds at unusually low prices. Many of these birds could not have been bought earlier in the season at any price, and in proof of their breeding qualities we now have hundreds of early chicks bred from these birds that are coming on splendidly.

In this sale will be S. C. White Leghorns and White Rocks that have won National fame, including the following Leghorns: "Bill Taft," 1st Cock at New York State Fair, 1914; "Victorine" 1st Hen at Boston, 1914; "Impatience," head of 1st Pen, New York State Fair, 1914; "Early Bird," 1st Cockerel, N. Y. State Fair, 1914.

This will be an unusual opportunity for you to secure Rancocas prize winning birds and choice breeders.

Write for our "Summer Sale" catalog.

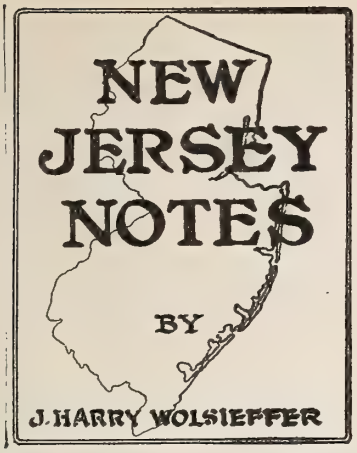
Irving F. Rice & Son

R. D. No. 7 Cortland, N. Y.



THE "flare-back" on the lawmakers will come this winter when the State Poultry Association will inform them how well the poultry raisers of the state were treated, when not one dollar was laid aside for poultry interests at the "Pan American Exposition."

* * *

Chicks have made good growth and a lower death rate than ever before in this zone. Fine growing weather has fallen to the lot of the average keeper this spring and the 1915 output of poultry, while no larger than last year, will be of better quality.

* * *

Under the progressive management of Mr. Harry E. Rogers, the Trenton fair poultry department bids fair to be on par with Allentown, Syracuse and Hagerstown, in the near future. One of the features, a most liberal one is $100 offered by the New Jersey State Poultry Association for an egg exhibit. Prof. Henry R. Lewis and Prof. A. L. Clark will be the judges on utility classes and the prizes are $2 and $1 on single entries, pens, $4 and $2.

* * *

For years New Jersey has been known as the utility or commercial state, due to the fact that with good nearby markets paying the highest prices for poultry and eggs and a climate and soil adapted for best results in poultry, the majority of those entering poultry did so with the purely commercial end in view. But it has in the majority of cases been a safe and sane utility proposition, the owners of the different poultry farms adhering closely to standard type. Now and then one can find a careless poultry keeper who has allowed shape to go to the "bow-wows" with egg production the only aim but the majority of utility breeders have flocks that look like the breed they are named for.

* * *

While not so many have entered the poultry ranks as in former years, due to the war, high price of poultry feeds, etc., those who have entered seem better prepared to meet the expense of the first year. Can it be possible that at last a few are commencing to heed the teachings that, those who have been through the bill of experience and have made good are handing out? It is to be hoped so.

* * *

There is no real reason why there should be any great dividing line between the so-called utility breeder and the fancier. Both must have standard type, because that is one of the utility qualities in any breed. Both should have flocks of safe and sane egg producing powers, and the only part where the good fancier leaves his utility brother is in the more careful selection of color of feather, eye, shape of comb and other minor qualifications, that does not appeal to the so-called utility breeder, but does no harm to the fowl if added or left off.

* * *

The breeder that advertises and gives full value to the purchaser from the advertisement is the one that will stay in the poultry business. Fair treatment is the only way to succeed in a business like poultry, in which it is so hard to please, due largely to the fact that in a majority of cases the beginner expects more for the money than should be expected.

* * *

Alfalfa has just the material in it to form egg shell and is an essential part of every ration for poultry. Each 1,000 pounds contain 30 pounds of lime. Fowls fed daily on it will prove to be better layers than those not so fed. and the alfalfa hens will be far the healthiest. Alfalfa should be fed during the winter in ample quantities.

* * *

The breed a poultry raiser generally makes a success of is the one he admires most. To make the most out of poultry, one must like fowls. Some great breeders cannot see a good thing in any fowl but the one they admire and breed, with such liking for the fowl they attain the most in making that breed one of usefulness and beauty. Of course, all don't think just alike. As otherwise there would be but one breed.

* * *

Save the poultry dropping, keep them dry and free from feather and foreign matter of all kinds. Remove the droppings at least three times a week and when dry place in barrels in a dry place. They can be sold to tanners, gardeners, florists and fruit growers. A hen will yield 35c worth each year. If all could be saved it will sell from 50 cents to $1.25 per barrel at your own door.

* * *

Mr. J. Walter Keller, of Philadelphia, Pa., gave an interesting illustrated lecture on poultry diseases before the members of the Vineland, N. J., Poultry Association on the 14th inst. Mr. Keller is not only a trained student but also talks from practical as well as laboratory experience, and the members could not help but derive much good from the lecture. It is just these helpful lectures that will help any poultry association to do much good and not only hold its membership but increase it. In this respect New Jersey has taken an advanced step and but few months will pass amng the 50 odd poultry associations in the state without some practical poultry speaker being scheduled.

* * *

At a regular meeting of the executive committee of the New Jersey State Poultry Association, held at New Brunswick, June 5th, much important business was transacted. Dr. Johnson, chairman of publicity committee reported progress and work was outlined for the coming year. Legislative chairman, Mr. C. J. Fisk reported progress and important work to be taken up at next session of the Legislature in January. Mr. C. D. Cleveland, chairman of the Educational committee is hard at work on the program for field day to be held Thursday, Friday and Saturday, September 9th, 10th and 11th. The meeting in August will be an executive one. Mr. V. G. Aubury, chairman of the Co-operative committee, reported progress, with a large increase of egg shipments to the state commission merchants. A state pin with coat of arms of N. J., solid gold, was ordered; also a state poster, free to all members who will write secretary, C. H. Hagland, Ledgewood, N. J. The state show will be decided at the August meeting by the executive board.

EVERYBODYS NEWS *from* EVERYWHERE

BY JAS. T. HUSTON

ONLY a few more weeks until the opening of the Fall Fair Season. With it will bring the usual number of disappointments as well as triumphs to the poultry fancier. You who are successful, be not satisfied, but strive for greater victories at the coming shows and you who are less successful, resolve to show those later chicks at the Winter Shows in better show condition.

* * * *

New Jersey can soon discard her non de plume "Skeeter' State and adopt one which is more rightfully hers, "Chicken" State as there indeed is a hotbed of poultrymen, comprising utility and fancy, inveritably making good on good common sense.

* * * *

Mr. D. Lincoln Orr has been elected one of the vice presidents, as well as a director of the New York Poultry, Pigeon and Pet Stock Association. All will agree that this is a most wise selection, the election and appointment being entirely unsought makes the compliment more marked. For years the visitor at the Garden Shows have always found Mr. Orr right on the job, always ready to stretch a point for the comfort and pleasure of exhibitors and visitors alike. We know that here is a man whose influence will be felt for good in his new position.

* * * *

The Pacific Coast gains another poultryman in Judge W. S. Russell, of Ottumwa, Iowa. Mr. Russell having decided to make his home permanently somewhere on the Pacific Coast.

* * * *

Texas now boasts of the largest turkey ranch in the world, this ranch being located a short distance from the town of Seguin, and covers 30,000 acres. Texas could provide room for a few more ranches of like dimensions and yet not be crowded.

* * * *

The Illinois State Board of Agriculture has selected Mr. J. C. Johnson, of Springfield, that state, to act as superintendent of the poultry exhibition of the State Fair. Mr. Johnson is a judge of reputation and we doubt if a better selection could have been made. The Illinois State Fair has shown a marked advancement in its poultry department and under the direction of the new superintendent will advance still further.

* * * *

All through the Middle West, reports are that the weather has been most unfavorable, being cool and unseasonable. We fear that when the hot weather does come the chicks will suffer, unless precautions are taken to insure plenty of shade. Usually a wet spring retards the growth of the chicks, and a quick change in weather conditions to that of extremely hot, finds the youngsters unprepared for the sudden change. Give them all the comforts possible.

* * * *

Broilers sold on the Chicago market on May 20th at 35c a pound. Not bad when you consider that ten to twelve weeks old cockerels easily weight two pounds or over.

* * * *

Cleveland, Ohio, fanciers are already looking forward to the 1916 meeting of the American Poultry Association, with the hopes that their beautiful Lake City may be successful in securing the annual meeting. One of the strongest arguments they advance is that, Ohio has not entertained the Association for the past ten years, and that from the fact of this year's meeting going to the Pacific Coast, next year the Central West, where a larger attendance can be expected, should be selected.

* * * *

Several County Poultry Associations in Illinois have united in asking the General Assembly of the State Government to appropriate fifty dollars to aid each county in giving poultry exhibitions. It to be stipulated, however, that each county association will give at least one hundred dollars in premiums to be eligible to this appropriation. What a wonderful good could be accomplished for pure bred poultry if every state in the Union would thus come to the assistance of our local poultry exhibitions.

* * * *

Each day the Panama Pacific Universal Poultry Exhibition is being more widely discussed, this naturally from the fact of our near approach to the Poultry Show season. That this exhibition held at San Francisco will prove to be one of the greatest Poultry exhibitions ever held in this country, is a foregone conclusion among poultry fanciers.

Every poultryman should feel a pride in this world's gathering of the best products of factory and farm, where will be gathered in grand array the remarkable acomplishments of twentieth century progress.

* * * *

As poultrymen we should feel proud of our part in this world's exhibition and whether or not we may be able to attend, we should, if at all possible, be represented by an exhibit, thus helping to show the greatness of our industry by our assistance in making the Poultry Show one of the big features of the Fair.

* * * *

Surely Missouri has a warm side for poultry culture and this from the Governor down, and the wonderful strides this state has made along lines of poultry advancement is only a demonstration of that which can be accomplished by other states if the wheels are put in motion.

* * *

Missouri's appropriation for poultry work during the next two years is something over eighty thousand dollars, together with an additional ten thousand to pay premiums at the different County Poultry Shows.

* * * *

Mr. H. H. Collier in A. P. J. suggests that a special train bear the officers and as many other members of the American Poultry Association as it would be possible to assemble, at Chicago about November 1st, and from there take a part steamer and part rail trip to San Francisco. This Mr. Collier explains, can be done at little increased expense and would be a delightful trip for all, particularly those who have never as yet viewed the grand Pacific.

* * *

Instead of worrying over past mistakes in your poultry keeping, brace up and resolve to avoid mistakes in the future.

* * *

This world is big or little, according to whether we live big or little

* * *

The "Athenian," published at Athens, Pa., in the year 1854, by the father of the writer, quotes eggs selling at Boston in April of that year at 45 cents the dozen. Truly the American hen was profitable then as now.

* * *

The South African Poultry Magazine, published at Johannesburg, South Africa, comes regularly to our desk each month and contains much interesting reading, pertaining to the Poultry Industry in that far land. All going to show that even with the ravages of the world war, poultry interest is continued.

* * *

It may be interesting to many American Fanciers to know that the poultry show season in South Africa is now at its height. Many of the associations are donating the profits of the exhibitions to the Hospital Ship Fund. The Central South African Show, being held this month at Johannesburg, advertises this event as a benefit performance for the ship fund.

* * *

Wisconsin fanciers are planning to show strong at the San Francisco exhibition, also reports from that State show a steady advancement along all lines of the poultry industry.

* * *

Messrs. Frank E. Herring, South Bend, Ind.; George Burgott, Lawton Station, N. J., and Dwight E. Hale have been appointed by the President of the American Poultry Association to act as a committee on transportation. These gentlemen will undoubtedly be able to furnish much valuable information to the intending visitor.

* * *

Mr. L. J. Jones, poultry expert of Purdue University, Ind., could pay no finer compliment to Mr. L. W. Gudgel, of Columbia Co., Indiana, than that he selected this gentleman's farm as the one best adapted on which to carry out his experimental poultry work in that county.

The purpose of these experiments being to show that better results can be accomplished on less money than now is being paid out on the upkeep of poultry yards.

HENS will greatly increase the output of eggs if fed liberally with skimmed milk at this season of the year. Try it to be convinced.

* * *

Elsewhere in this issue will be found a very interesting letter from Mr. Chas. D. Cleveland, Secretary of the New York Madison Square Garden Show. In this letter of general interest, Mr. Cleveland settles for all time the much discussed question as to the time of holding the next Garden show.

* * *

We call the attention of our readers to the interesting advertisement of the Diamond Box Manufacturing Co., Minneapolis, Minn., elsewhere in this issue. To demonstrate their article, they offer to send without charge a sample of their latest improvment in egg carriers. Write them today. J. T. H.

Department of the Great West

BY ESTELLE E. COLLIER
Tacoma, Washington

THE BIG poultry show at San Francisco comes off during the last week in November, 18-28, which gives those who would see the big exhibition a chance to kill two birds with one stone and become an active member of the poultry fraternity. This poultry fraternity is a very democratic gathering of men and women, many of them very important in the business world and they all look forward to November as the time when they will see the greatest exhibition the world has ever seen. At the same time the members of the American Poultry Association will join hands in one grand celebration. The world's winners in poultrydom will be there to set the standard for fanciers under the best judges the fancy has produced, and hens, eggs and feathers will be the topic of conversation when under the big roof.

Judge D. E. Hale will be judge at the Washington State Fair September 21 to 25. At all the fall fairs will be the best fowls the poultry fanciers have produced this year and last and test out their chances for winning at San Francisco. Naturally the best of those at the fall fairs will be in the running at San Francisco and stand a good chance of winning. The state fair at North Yakima always has a splendid showing of birds and the biggest breeders in the state are always represented. The weather is always fiine and attendance from over the state good. The poultry industry goes hand in hand with fruit growing in the Yakima Valley and those who go there year after year grow to love those rounded brown foothills dotted with green farms that surround North Yakima.

The Spokane Fair usually follows the State fair, but this year the Sponkane fair will precede it, having September 13 to 18 as their dates. J. G. Dickson is superintendent of poultry, and George P. Larsen secretary. D. E. Hale will be the Judge. Spokane draws her crowds from that great inland empire of Eastern Washington and Idaho. The weather there is like that of North Yakima, warm and dry until late in the Fall. The immense stretches of irrigated farms around North Yakima and Spokane are a revelation to the visitors from West ern Washington and the East, who go there. Nowhere does fruit attain such size, nor fruit trees get to the bearing stage sooner than in this irrigated country. This is why the fairs of eastern Washington attract from everywhere people interested in the development of farm lands.

Everybody on the Pacific coast is pleased with the stand taken by Everybodys in favor of the American Poultry Association meeting at San Francisco. Some of the Eastern Poultry Press made a hard fight against a Pacific Coast Convention. Their claim that it was too expensive is not in keeping with a "Billion Dollar" industry. These papers must learn that the American Poultry Association is a national if not an international organization. So long as this convention is on wheels and goes from place to place every year, the membership will vote it where ever they think the most good will be had for the greatest number and the poultry fraternity.

I believe that the Organization will advertise itself to a better advantgae at San Francisco than anywhere for the reason that its name will be connected with a World's Fair along with a World's poultry show. Do not forget either that the Pacific Coast does not stand still. We double our population and more every ten years, as well as inncreose the poultry population in proportion. There are more poultry men on the Pacific Coast than are now members of the American Poultry Association and MAY I ask if this is or is it not a good field for poultry activity.

It is our desire to make this department of general use and a source of reliable information on poultry affairs of the Northwest and the Secretaries of the different poultry associations throughout the country are respectfully requested to send word as to their show dates, judges and word of any important meetings and happenings in which the people may be interested. We shall be glad to answer any queries concerning poultry.

The South West Washington Fair comes along in August 23 to 28 with H. H. Collier as Judge. The So. West. Wash. Fair has been growing from year to year and the poultry department of the fair has had representives from all over the State and Oregon. Chehalis is quite a city and so well located that people from everywhere in the state can get there with little trouble. They always have a large exhibit along other lines such as cattle, dairy and bee products as well as a large exhibit in the woman's department.

Wheat has fallen in price which means coming prosperity for poultrymen. People cannot enthuse over the raising of large flocks when eggs bring small price and feed remains high. When feed drops in price you and the fancier overstocked with orders and people do not hesitate to pay large prices for their fowls as they realize that their feed bill will be small and the meat value of the fowl is always there on demand. Even fancy birds find a slow market when feed is high and mongrel flocks soon eat their heads off. Low prices of wheat foretells a flourishing business in broilers for in this day chicks by the thousand and brooder mothers are so ably caring for them we are sure to realize that the mere matter of egg production as the only utility side of the hen proposition must take a back seat. The meat question is the most important ques-

1ST COCKEREL, BOSTON, 1915

Homestead Campine Farm, Wayland, Mass.,, produced a good one at the recent Boston Show. He was a nice shaped individual, having a good head and a wonderful clear hackle. In body color he was clear and distinct in the white marking while his black ground color had plenty of green lustre, which is so important in this breed. His saddle and back were well furnished with clear marked plumage and no doubt, as head of one of the numerous breeding pens at Homestead Campine Farm he will prove to be a good breeder A. O. SCHILLING.

tion this country has to face today even if we are not thrown into the world war. The only relief we can get from exhorbitant beef prices is to flood the market with fowls bred to suit every requirement of the table. We have our small breeds and medium sized breeds and our breeds that produce birds as large as an ordinary turkey. We can produce to order fowls that will weigh to an ounce what the market and the people demand and the field is open to all. Incubators are low priced and let me tell you that we have tested incubators that did not vary three degrees during three and four successive hatches. We have found them to be more wonderful in replacing the hen in hatching our eggs then we are still old fashioned enough to want to see our young chickens in charge of motherly hens after hatched. This demand that has never been satiated, the demand for market fowls. is one of the things that has put poultry raising on its present solid basis and given the dignity of an established, organized industry. Just as we love to see a Jersey cow look like a Jersey, just as we love to see a Collie dog look like a Collie and not a mongrel. So we will always look with great favor on the fowls that are Standard bred. The more important the poultry industry becomes and the more necessary fowls are in solving our meat problems the more particular we will become as to breeds.

Pure bred fowls have come to stay and seldom do we see even an indifferent farmer whose wife raises chickens as a side issue for pin money that does not advise killing off the mongrel hens the very moment a few standard bred birds appear on the place. The first question asked of us when visitors come to our ranch is: "Are your turkeys standard bred?" Are your chickens all of one breed?" It does count and the very fact that every fowl on your place can boast a well known strain creates a demand when people come to the point of buying. Many a family has driven past our place merely sight seeing and returned a year later to inquire as to the values represented in the poultry yards and later ordered eggs over the 'phone. The mere fact that our hen houses are uniform in shape and size and placed with some regard to a general plan seems to attract the people. Love of beauty is innate and this love will insist that pure bred fowls take the place of scrubs on every farm and in every poultry yard. The old plea that egg production demanded a mixture of breeds will be refuted by the proven argument that it has taken standard bred birds to beat all egg laying records. We have among our standard bred birds those that have developed the greatest capacity for egg laying and as long as an uncertainty exists as to the result of mixing breeds we are bound to forge ahead with our development and beauty of form and feathers.

The poultrymen of the Eastern States should by all means come to the American Poultry Association conventions. This is one great chance when the poultrymen of the East may see our Western States in all their Alpine loveliness and understand why we appreciate and rave over the cool summers that eat so far into the winter that Spring is here before the Summer is all gone. Our coast waters never freeze and the snow and ice that is left behind in November in our Eastern States will be replaced by the springlike days of our coast weather that is always spring and fall but never hot in summer. The poultrymen of the East will have the time of their lives enjoying the big fair at San Francisco as well as meet the poultry fraternity from all over the world.

For Fall Shows

Our birds never looked so fine. Ready for delivery in prime condition, August 1. Wilburtha S. C. White and Buff Leghorns, Col. Plymouth Rocks and Col. Wyandottes are winners—always. Reserve early. Send for new Catalog.

Poultry Industry Shows Steady Growth

Giant Strides of Business In Past Few Years. Big Demand For Product. Right Understanding of Methods Make Reasonably Sure Profitable Return.

By J. Harry Wolsieffer.

DUE to the amount of publicity given it by the press in the last few years, the questions often asked are, will the poultry business be overdone? Will the many new commercial plants that have been erected in the past few years cause an overstocked egg market during the fall and winter months? Will the demand for broilers and roasters in their season cease, or the markets be so stocked that the price will fall to a figure in which no profit can be made? These questions were asked some 15 years ago, when the poultry business as a business was beginning to boom, and today the price of poultry and eggs is at a figure in which the up-to-date poultry raiser can make a fair living.

The supply has never exceeded the demand for fresh eggs and prime broilers, or roasters, capons and fowls in their seasons. There have been off years, there has been an overstocked egg market at certain times, but never of the fresh variety, and for many years to come there will always be a demand at fair prices for fresh poultry and eggs. While it is true the poultry industry has thrown aside its swaddling clothes and assumed the proportions of a real industry—a billion-dollar industry within the past few years—nevertheless the fact (that should not be lost sight of) that the population of the United States, the consumers, has grown as fast as the poultry business, and the demand still exceeds the supply of the A No. 1 article. Next to milk, the fresh egg is a complete food and will always be in demand. Poultry, fresh killed, is a dish relished by almost every member of the family, and with the high price of meats, which promise not to get lower, the opportunity for those who like poultry and wish to make a good living was never brighter.

Perhaps, like any other business, if every one entering poultry operations would succeed, lower prices might prevail, but they do not in poultry, or in any other line. There is, and always will be, a certain per centage of failures, and it cannot be blamed on the fowls, but the lack of ability on the part of the operator, and circumstances which sometimes confront the poultry keepers.

Some of the largest plants, operated under the direction of men with plenty of capital, have failed. It is so in all lines of business, and poultry is no different, except that those operating it deal with life and death. The beginner often jumps in without the proper knowledge of the business, and 90 per cent. of the failures are due to operations performed on too large a scale in the beginning. Many a beginner has failed when just upon the verge of success, due to lack of capital to carry the business to a successful venture. So few realize that 100 hens mean over $100 in feed bills; 1,000 hens, over $1,000, and it requires not only knowledge, but a good supply of cash to successfully carry out the venture. Too many do no figure on the proper equipment, and to make a success this is the first essential—good, not necessarily expensive, poultry buildings. The makeshift dry goods box or the oft-read-of piano box may appeal to those of a saving nature, but it is expensive in the long run on any poultry farm where a good living is expected. In these days of high-priced lumber one cannot erect a good poultry house for much less than $1 per bird, and the beginner should carefully figure out in advance the cost of the poultry equipment. These and many other things are not looked carefully into and are the cause of many failures.

Then there is the big poultry plant, with costly upkeep—and perhaps a high-priced manager who really does not know—and failure is chalked up against the poultry business. But the beginner who really likes poultry—the free, healthful outdoor life and willingness to work—starts at the bottom and gradually works up, as the majority of the successful poultry raisers of today have. There is money in poultry, and any amount of money properly invested in poultry in this manner will prove a paying investment, and the opportunity is better now than in the past, with the good markets and fair prices, and with better equipment and a far better knowledge than ever before. The industry as an industry is just in its infancy, but the would-be operator should have a thorough understanding of the business before the expenditure of any considerable amount of money. A good living cannot be made out of a few hens, nor is there any $6.41 per hen profit commercially, but there can always (when the operator understands the business) be a fair margin of profit, that will be satisfactory to the majority who raise poultry.

All the Music of All the World

Can Be Had With the "Columbia Grafonola"

The voices of all the world's artists who have ever made disc records, without exception, are at your command if you own a Columbia. Because, although a majority of them make records exclusively for the Columbia Company, the instrument itself is so constructed that other makes of records can be played—the records are interchangeable.

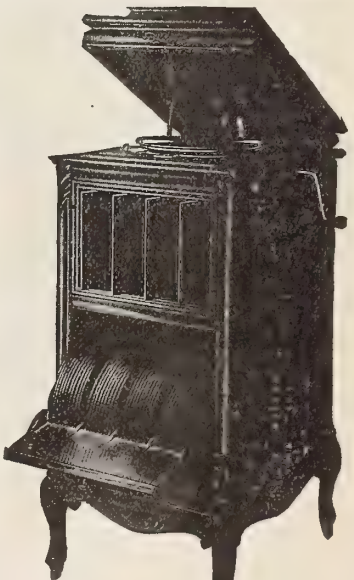
Our catalogue will help you to gather a fair idea of the unequalled range of the Columbia repertoire and the unlimited variety of music that is engraved upon Columbia Records and reproduced by Columbia Instruments. Not only the voices of the great artists of opera, in solo and in concert numbers; not only the recordings of the world's great masters of the violin and of the piano; but the music of the great orchestras and bands, and of the soloists of those organizations, and the songs and humor of the stars of every stage—music for your every mood and for every occasion that music meets; music for the quiet family hour, for the cheer of visitors, for the dance, for indoors or outdoors, at home, on the yacht, at the club, in the church and in the school. **This is truly "the one incomparabl musical instrument," and "the one most versatile and indispensable entertainer."**

"THE BABY OF THE HOME CAN PLAY IT"

Special Instructions to Agents

1st. Renewals count the same as new subscriptions. 2nd. Cash must accompany all subscriptions; this will avoid all misunderstanding. 3rd. Keep a duplicate list of all subscribers sent us, in case any question arises when the contest closes. 4th. In case of a tie, the value of the prize will be divided. 5th. This subscription contest closes September 15, 1915. All letters postmarked that day will be counted, thus giving those at a distance an equal chance with those near. 6. A list of all winners will be given in the October 1915 issue. 7. All agents may work where hey please; this is fair to all. Send for more supplies at any time. 8. No subscribtions can be sold for less than 25 cents. 9. You must send at least six subscriptions to entitle you to agents commission on prizes. 10. All subscriptions must be taken on the merits of the publication. 11. **Notice.** Take three years subscription to "Everybodys" for $1.00 to any one party. Send 75 cents and keep 25 cents as your commission; this will count as four subscriptions on the contest.

SECOND PRIZE



COLUMBIA GRAFONOLA "Mignonette" Cost $100.00
Free to person sending in the second largest number of subscriptions before Sept 15.

THIRD PRIZE

Do Not Now Delay to Enter This Contest

Remember you are to send us only 25 cents for each subscription. You keep the balance for your commision. This opportunity is yours to accept. You receive your choice of the Poultry Books offered for the first six subscriptions you send us. Send for sample copies and subscription blanks today. they will be supplied at once, free of charge. Start today as you will be getting in on the ground floor.

The Black Langshans

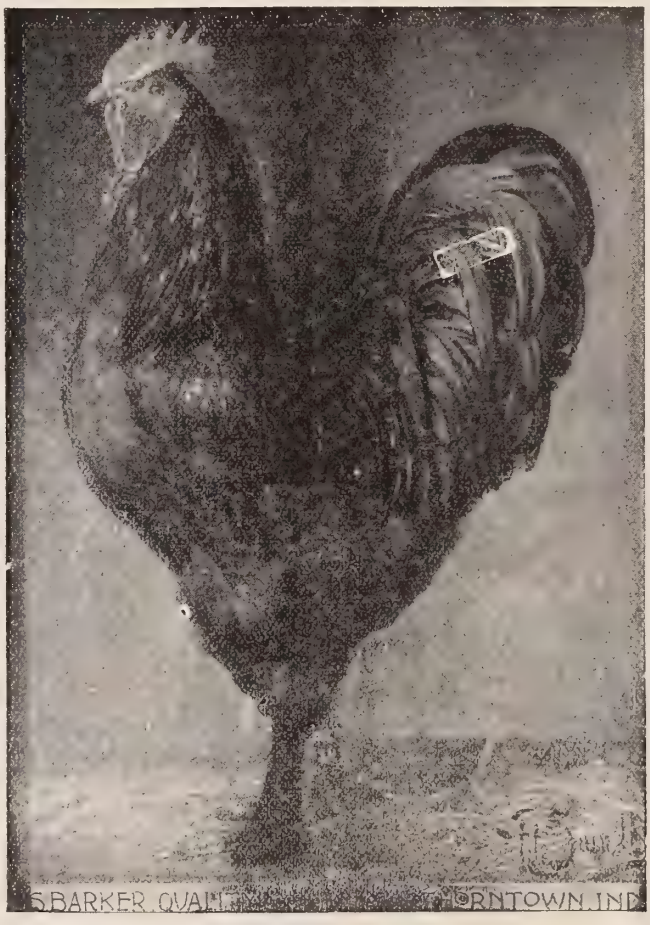
A Variety of Character and Unsurpassing Beauty. No Bird Is Hardier or Possesses More Vitality. Noted Winter Layers, Good For All Purposes and a Most Practical Variety.--By Mr. Alexander N. Warner.

WHAT is written here has not come from the pen of a writer, but from a Langshan fancier, who hopes that by writing his ideas and fancies, he may lead others to better know and appreciate his Breed. It is a poor platform to claim too much for anything but here is a case where lack of originality prevents the writer from really saying more than what others have said or would say for the Langshan. Believing that the ideas of some of the advertising managers of America's leading poultry journals, may be correct, I am sure it behooves all Langshan breeders to do more talking, showing and advertiseing for their favorite Breed. Much has ben written for some of the breed —a little for th Langshan — but to little for a breed a deserving as ours— perhaps for the rea sons suggeste above.

I showed my bird at seven shows th past season an while I was the lon Langshan exhibito at four of them, I am sure it will no be so the coming year. Each of the last mentioned shows had many vis itors and I believe the Langshan wo its share of admirer —consequently buy ers. Eighty pe cent of my old floc is now gone an many birds went t these same visitors whose fancy le them to the Blac Langshan. Throug the advertising col umns I sold the rest Judging from th ease with which was able to dispos of my surplus stock I should certainly say that Langshan Popularity was growing and in our breed we shall always have one of our country's favorites.

It is not necessary to detail how the Langshans came to us—but it is important to know that it is here to stay. It was first imported to this country in 1876, coming originally from China, and from that day to this has proven all its most ardent admirers have claimed. The Black Langshan is one of the few original Standard Breeds still unchanged, and even the imaginations and ideas of those judges who are always looking for something different, have failed to make a different Langshan, and after forty years we find them one of the purest of all breeds.

The Langshan fowl is a fowl of unsurpassing beauty—the aristocrat of all show rooms—and there is no more impressive and commanding figure than the Langshan male, with his flock at home. The glossy, greenish black coat, which adorns the typical show bird, the elegance of carriage, and general bearing make our Langshan appeal to those who care for richness and the artistic in their



fowls—even though they may not have either in their pockets or their homes. The size of the breed makes it desirable for any of us, whether we live on the farm or in the city. A cock bird weighing fifteen pounds was raised near here by one of my friends and at present I have one weighing close to thirteen. My best hens all weigh near eight pounds and I have killed some which weighed ten. I have never worried over the visits of my friends or neighbors, as meal time approaches—when I have a Langshan for the table. They are recognized as the best of all breeds for caponizing, not because they grow to be larger, but because they are more easily operated upon than any of the others. These are a few of the things which point us to the fact that in the Langshan we have not only a grand big show bird but one for the utility raiser as well.

There is a fallacy which has been the greatest stumbling block in the path of Langshan popularity, it is the fact that many are led to believe that for meat, the white fleshed Langshan does not compare favorably with other breeds. However, when we look at the meat of some of our other popular breeds--really white meated crosses descending from the Langshan, we can hardly comprehend why the Langshan should be discarded for its color, especially when it is a fact that for fineness of grain smoothness of skin tenderness and sweetness of flavor, the meat of this breed can not be excelled. This prejudgment of the Black Langshan without due examination, seems to have troubled some of its breeders, but I have always a ready market for any broilers or other stock which I might care to sell. Dressed Langshans will compare favorably with most any breed and it is not uncommon for the dark feathered, white fleshed birds to carry off the honors in the fancy dressed poultry exhibitions. Why should the American be averse to any white-fleshed fowl, when it takes this variety to tempt the appetites of the connoseurs of Europe and the patrons of the Parisian restaurants.

One of the main reasons which led me to fancy the Langshan and keep the old flock which my father started nearly thirty years ago, was the character of the breed. Some of my friends laugh at my assertion that the Langshan or any other special breed has "character," claiming outside of general habits, all are alike. As these same men own small breeds, I can easily understand their belief as I cannot place the word with this

class. I leave it to the reader of the following few incidents to judge whether I am right or wrong—I have seen the Langshan cock bird deliberately fight and fly at a stranger, who, when looking over my stock, took the liberty of picking up on of his hens—while there is never a "riffle" when I do the same. I have seen the Langshan mother fuss and fume at the approach of men she had never seen, only to become quieted by my appearance or of my setter dog "Duke," with whom she always trusted her young. I have taken several pullets, which had adopted the straw strewn floor for their first nesting places, put them on the regular boxes and without those common nervous flutters of some breeds, they settled to their work and from that time on they knew their places. The big brown eyes of the Langshan always remind me of my dog, whose eyes alone tell much. My lawn is my poultry parlor and I can always read disappointment in the eyes of our family pet, as I almost push him and his family back into their yards. Rarely do you see a scary, flying Langshan, though they are active beyond the imaginations of those who know so little about them. Most of the netting for my yards is but three and four feet and my hens are never bothering the neighbors—and it is a good plan to keep friendly with city neighbors by keeping your hens from their flower beds. Some Leghorns which I once attempted to keep here in the city, took about as much notice to my fences as the nowaday aeroplane flyer does to a river. I do not believe that scary hens, even with eight foot fences, are valuable assets for the city poultry fancier. Langshans and females will follow like dogs and it is seldom you hear of a Langshan breeder with nets or leg hooks with which to catch his stock.

I am satisfied that the laying ability of any breed is one of the first things for consideration—especially for those who are contemplating a start in the poultry business. I have been asked many times "How do the Langshans lay;" and to this question I can truthfully answer, "Fine"—especially during those spells when other breeders can hardly stretch the facts that far. I have had some wonderful testimonials from those who bought Langshans from me, but as I can not absolutely verify these statements, I will go to the published records to prove that our breed are layers, "not by word but by deed." We need look no further than the present Missouri Egg Laying Contest to see that among the many hens entered, a Langshan hen stands fifth after five months. Last season and the year before, the Black Langshans made records there which any breed might be proud to possess As I implied before, it is in the winter time, when eggs are scarce and high in price, that this breed is at its best. You never find them huddled together using their energy to keep warm—as I have seen in zero weather in the pens of some of my friends with their little breeds. I have noticed some remarks from those who keep Langshans on the farm and who find they get as good if not better results from those in pens. This speaks well for the breed as a city fowl and reminds me of a remark by the former Langshan Fancier and Artist, Mr. Sewell, in one of the poultry papers: "You will not easily overfatten the Langshan—like the Jersey cow for cream, the Langshan turns its food into the production of eggs rich in their contents." The eggs are dark brown in color, large in size and if you will weigh a dozen of these along with a dozen of those from the Leghorn variety, you will doubtless receive a surprise.

While I have not raised any of the other breeds as extensively as I have the Langshans I can hardly believe any breed can possess more vitality or be hardier than this breed. As chicks they come from the incubators big, stong and healthy and I am never bothered with the dreaded White plague. I hereby "rap on wood," but I am not worrying as are some others who are trying to raise the other kinds. When I hatch a a hundred chicks, I figure on having that many matured birds and this is more than many breeders even wish. I do not follow any prescribed system of feeding for my chicks, but have found that by starting mine off chick grains and Blatchfords Milk Mash, they grow like weeds. Many visitors who come to look over my flock are astonished at the rapid growth and hardiness of my small Langshans. I have also found that it will never do to keep too many in one coop, mainly because the chicks grow faster than we realize and lack of air, water and unsanitary conditions, which is common to crowded quarters, only tend to stunt and keep back the growing chicks. Give a Langshan plenty of good feed, clean water, room and green stuff and you will have to go far and wide to beat them.

In conclusion I would again like to point out the reasons why we should have more Langshan Friends and Fanciers. The breed consists of beautiful show birds, with an original shape and style—not manufactured and consequently not too hard to breed, for the Standard requirements. They are excelled by none for the person who wants utility as they are large, fine fleshed and small boned besides being as good as the best winter layers and better than the average for the year around. They are not wild, flighty or unaproachable and as they are hardy both as to old and young, I believe we have a breed from which it is impossible to ask much more.

Supplying Geese and Ducks For Market

Time Has Made Changes. The Drive a Thing of the Past--Steam and Motor Cars Now Used In the Grand Wind-Up.--By Felix J. Koch.

YOU who would regale on the winter goose and duck hearken to a tale of modern methods applied even to the most rustic of country life! You who were wont to ride countryward in the late autumn, at the season "when the frost is on the pumpkin and the fodder's in the shock," largely for the sake of watching the flocks of ducks and geese grow in numbers on almost all the longer turnpikes entering your particular city, search, these days, in vain for this sight—dear to you since childhood—for the reputed poultry trust and the railways have arranged for the shipping of geese and ducks the winter over, long since, by rail; and, that the poultry-trains be not delayed, the farmers who supply the trust have the geese and ducks crated or else caged at the depot-siding or else at the little flag station when the limited goes through. All of which is sending the price of geese and ducks up, of course. Former years, in Thanksgiving season, farmer boys had little to do out on the farm and were glad of the lark of driving the poultry in for the sake of the visit to town which it gave them. Today the man who goes ahead and plans all this is paid a neat salary, the stationery and mailing required represent money—both in stamps and in clerks to address—the railways make a profit.

For example, Marysville, Ky., is the centre-spot for the vast goose-belt of the midland and yet the geese here are far from cheap. These geese, when sold to the consumer, are dressed, of course, for the feathers make up no small item in the trade.

Lovers of country life, however, view with regret the passing of the goose—drive in particular. Already in midsummer, when the goslings had been hatched and the little ones had passed their most ticklish season; when the young birds were "on the hoof," as the buyers call it, and a farmer knew how many of the older birds he would be willing to market that season—the buyer for some great commission house came out the 'pike.

Of, course, father must take two of the boys, at least, to consult as to prices, and incidentally, to sample the cigars, and, finally, accept the trinkets for their wives he gave each good customer. Wily fellows, indeed, were these poultry buyers They had to be, for competition was keen, and you had to see to it that the man would sell you again next year.

The upshot of these meetings was that Farmer Rendigs had today so-and-so many geese or ducks he would be willing to sell, 'come November, providing that not less than so-and-so much was paid. He reserved the right to sell to any other party who would exceed this price by so-and-so much; and, as result, the poultry-buyer was forced to give the farmer what the believed was the most the market would bear.

They figured, then, on a certain percentage of loss—that is, birds might stray, be lost or stolen, get run over on the high road and what not. The poultry buyers knew this percentage to a certainty. Then it was duly signed and certified that on the morning of November 3rd and each succeeding 3rd of the winter months, unless heavy snow or rain prevented, in which case it would be the first reasonably fair day thereafter—old man Rendigs would have the given number of fowl at the cross-road leading to the farm, from the main turnpike. The geese should be in prime condition and, if possible, penned a few days before, in order to rest them, that they might be fresh afoot.

The farmer, on his part, would do what he could to please the poultry buyer; for he, in his way, was also dependent on the buyers and a man who was known to have "done" one of them would be apt to have the fact spread among all.

Finally the glorious morning came. Already the night before, the farmer and his sons had gathered the fowl by the use of corn into the barnyard —taking care that they should not

THE GOOSE BOY
On the way to market—some of the stra gglers of the drive.

NOTHING CAN KEEP THEM FROM WATER
They stalk at ease in a shady nook with contentment evident.

suddenly take it into their heads to waddle away. In turns they kept guard with their lanterns, while the red harvest moon crept through the shrubbery nearby and a frost settled on the earth.

With the first peep of dawn farmer boys and dogs came down. The birds were roused and shooed into a flock that would follow their leader anywheres. It was more a case of persuasion, however—and bribery. The simplest way was to throw a trail of corn before the strutting drake and, as he led, the ducks followed. Down the lane, past the corn-field, where so often, they had waddled, and into the high road. Then down this, taking on speed as the flock came to know what was wanted. On, ahead, some other man was driving geese and you took care to keep your distance, lest your own flock get mixed with these.

Wagons coming down the 'pike made way for the geese. Country boys ran to the 'pike to help past their father's bounds. Sometimes a pestiferous drake, scenting some pond from afar, flew to a fence-rail; then over, and often you or the boys had a long, weary chase to get him back.

By and by, though, you were at the high road. There, spreading corn ever so often, you waited the poultry buyer. Or, again, if you were to rendezvous at the tavern, you drove your flock into its yard, where a temporary wire netting was set up to enfence yours from the other fellow's. Geese, ducks, were everywhere. Clouds of white—blankets on 'pike—showed more and still more coming. In the tap-room men talked weight, feathers, effect of the weather and similar matters. And ever so often a man came from the little improvised office with a broad smile on his face, as he displayed a certified check on the Farmers and Traders Bank of Ruralburk, and invited the crowd to drink.

Usually the poultry buyer had the fowl driven to the railway, but in later days they were boxed and taken by cart, to save time.

Now the goseflock has vanished from the highways of the midland, and in fact, the country generally. Indeed the poultry buyers send out blanks to be filled in, stating the number of geese, of ducks, you will offer; price per pound and so on. Then they make a contract, which they sign and on that they base their contracts with the commission houses. In due course you receive a notice to turn over the agreed number of fowl to any express, and, forwarding their receipt to the firm, you receive its check as specified.

Time has come to mean money, out on the farm, too, and the chances are you take those birds in by wagon now. Some men even use the automobile. No one drives geese any longer in your township and you can't afford to be considered the only "hayseed."

Down at the track the poultry train is made up and waiting. You'll find the trainmen directing you to put your birds in such and such poultry coop, a cage which is built into the car. Coops will hold, at times, from 4,200 to 4,500 head of ducks, or say 900 to 1,000 geese. The arrangement is for 128 coop-compartments to the car, but by removing certain partitions used with the ducks, the space becomes large enough for the geese. When geese are bought this year by the commission house at the fabulous rates prevailing, who can estimate the value of a single car?

The law requires that the birds be fed and watered daily, and, where this is done, there is substantially no loss in transit; otherwise some deaths are sure to occur.

The arrival of a poultry train in some great city means a busy time for the consignee. Wagons standy ready to bring the birds to the commission houses—there ready to be watered and fed and then to be bid upon by waiting grocers and butchers; more anxious, each year, than ever, to secure the best birds for their respective patrons.

THE FALL FAIRS

The Value of the Fall Fair to the Poultry Industry and How They Benefit One Another

James T. Huston.

Have you ever stopped to consider that there are thousands of county fairs held annually in this country. In fact, every state in these great United States have their county fairs. and in some, hardly a county but which annually holds a fair, some small, it is true, while others are of National renown. These are not all, for in addition we have the state fairs, of which almost every state now boasts.

Truly the fairs, county and state, are institutions which have become fast rooted and have endeared themselves to all.

From an educational viewpoint, the fairs have been one of the main factors for advancement along all lines of agriculture and stock breeding, not only interesting the farmer and those engaged in live stock farming, but have been the means of causing others to engage in the business.

The "Fair," unlike many other American forms of amusement and entertainment, has not been patronized for a time and then sidetracked for something new to the minds of our ever changing American people, but today is greater and stronger than ever before, and to show the appreciation the managements of our thousands of fairs feel to the people who yearly flock to them, they are endeavoring to give them exhibitions along advanced ideas. The fairs of ten or fifteen years ago and the fairs of today are so vastly different that comparison is unthought of.

The above pictures one of the wonderful S. C, Buff Orpingtons as bred at "Sunswick," "Golden Crowns," records at America's greatest shows have stirred the Orpington world, and from this noble specimen many prize winners have been produced. J. T. H.

Progress has been rapid: The torn down fences, the old dilapidated buildings, the grass grown tracks, have been succeeded by beautiful grounds, laid out by the landscape gardener, with his eye ever open for the beautiful, that today we have imposing entrances with the street car and jitney unloading at the gate, grandstands of mammoth proportions, race tracks where world records are made and buildings of modern design.

No department of the "Fair" has advanced more than that of Poultry, and from the poultry buildings of years ago, where the birds were shown in dry goods boxes, and the judge used a step-ladder to reach the exhibits, we have the modern buildings, equipped with the best in cooping arrangements and as a rule, presided over by an experienced poultryman, who sees to it that the best of judges preside and that the premiums and prestige offered will draw the best of exhibits. We thus have Fall Poultry Shows equal in management and quality to our winter exhibitions.

Many of our most successful breeders made their start with their first win at some little county fair, call it "Pumpkin Fair," if you will, but that win was the starting point of a successful career.

Many of our judges who are today placing the ribbons at Madison Square, were among those who climbed the "step-ladder" to reach that "good one" on the "sixth tier" at the "County Fair" years ago. Truly we as poultrymen owe much to those who have fostered our Fall Fair Poultry Shows and this should always be born in mind, giving to them at all times the support they so justly deserve. We doubt if any other agency has done more for the promotion of the Poultry Industry. Thousands are now engaged in the keeping of poultry, who for the first time became interested with their first visit to the poultry building at the fair.

In this connection, we wish to impress the reader with the value of the Fall Poultry Show to our Winter Poultry Exhibitions, with them we have a great training quarters, whereby a few weeks later the specimens are shown in some cases, will in the beauty of their full maturity and plumage, wear the blue at the Winter exhibition.

The Fall Show creates enthusiasm for the later shows. The Fall Shows in a thousand different ways, make the poultry industry what it is today. Support them, give them every encouragement you can, by so doing you are not only benefitting the business in general, but you are widening your own business field, and by this giving pleasure to the hundreds of thousands who annually pass the gates of the Fall Fairs in the towns, hamlets and cities of this great, big, grand, peace loving, pleasure giving country of ours. J. T. H.

MONEY MAKING DISCOVERY

Missouri State Poultry Experiment Station,
M. L. Quisenberry, Ass't Sec'y.

MONSTROSITIES AND FREAKS

By Mr. Michael K. Boyer

Monstrosities and freaks every now and then crop out in the poultry yard, according to reports, many of which seem hardly creditable.

Double-yolked eggs, as a rule, seldom hatch; but sometimes they do—in some cases bringing forth two perfectly formed chicks, and in others there are some curious formations.

A neighbor hatched from a double yolked egg a chick with four legs, one body, two necks and one head.

Another hatched a three-legged chick from the same kind of an egg.

Babcock tells of a double-youlked egg which hatched a three-legged duckling. He said this third leg was as the fifth wheel on a wagon, and grew out of the duck's back. In other respects this duck was like the others, healthy and vigorous.

Babcock also reports a chicken with two heads and four legs, and a grown fowl that had two heads and apparently two digestive systems, which, however, ended in a single vent.

The writer recalls a case where from the same setting of eggs a cockerel and pullet were hatched, each of which had only one leg. They were owned by an Italian. An agent for a museum, hearing of the monstrosities, offered $25 for the pair, but was promptly refused. Several nights afterwards the chickens were stolen.

An English writer tells of a chicken where from the end of the backbone protruded another bone about an inch in lenght. From this two extra legs and feet depended. The extra bone being jointed, the chicken moved up and down while walking.

It is not unusual for deformities to be transmitted to the offspring. The writer had two White Plymouth Rock cockerels engage in a battle through a wire netting fence. During the fight one of the birds cut a piece off his comb (V-shaped) by getting his head fastened in the wire mesh. This cockerel was subsequently used in a breeding pen, and among his get was a cockerel that had a piece of his comb cut out at exactly the same place, and in the same style, as that of the parent bird.

It is common to hear reports of large eggs, small eggs, double-yolked and even triple-yolked eggs, egg-within-an-egg, kidney-shaped eggs, etc. All such freaks are generally due to an overfat condtiion of the hen.

Sometimes there is a radical change made in molting. The writer had a White-faced Black Spanish hen that, while it originally was a black feathered bird, turned partly white after the first molt. The next year it became two-thirds white, and the fourth year a pure white, not a feather on its body showing a tinge of black. The fifth year it molted part black, and in the sixth year it showed still more black, but, unfortunately it died before it had another molt. Judging from the changes made each molting season, it would not have been much longer for it to have resumed its entire black coat.

The proportion of down-feathers on the legs of Asiatic chicks when hatched, indicate the amount of feathers they will have when matured.

* * *

If one places his ear close to the body of a fowl while on the roost at night, when all is quiet, he can plainly hear the grinding of the food in the gizzard.

* * *

A mongrel and a scrub fowl are not necessarily the same. The mongrel may be a large composit fowl of pure bloods—that is, may be made by a cross of pure bloods upon common stock. In either case it is removed from a scrub, which is a measly, small, common fowl, without a trace of pure blood in its veins.

MADISON SQUARE GARDEN

America's Leading Show

Office of Secretary, Eatontown, N. J.

To the Editor of
Everybodys Poultry Magazine:

Dear Sir:

May I ask you to publish the following brief notice in regard to matters in connection with our forthcoming exhibition.

Despite statements I have seen lately in the Press in regard to a change in the dates of our show, I beg to advise that the exhibition will be held (as announced during the last show) from December 31, 1915, to January 5, 1916, inclusive. We open as usual on Friday morning and close on Wednesday evening. These I believe are ideal dates, and from assurances already received I am convinced that we will have perhaps the largest entry in our history. The period of the show covers New Years Day and will be open on Sunday, as usual.

I shall be pleased to hear from Specialty Club Secretaries in regard to their meets as I wish to close all matters early.

May I call the attention of your readers to the fact that in last year's catalogue the Index of Exhibitors shows not only the name and correct postoffice address of each exhibitor, but also gives the variety of fowls or pigeons entered by him. The Index, therefore, forms a very valuable address list which I believe will be eagerly sought for, and as there is only a small number of catlogues left in the hands of Harry M. Stevens, publisher, I would advise all those who wish to secure one to write to Mr. Stevens at once, care of Madison Square Garden.

Yours very truly,
CHARLES D. CLEVELAND,
Secretary.

There is no possible way of detecting sex of eggs. Mapes very truthfully says that the best way to tell whether an egg contains a rooster or pullet, is to hatch the egg under a hen, and watch the chick for about a year—if it crows it is a rooster; if it lays eggs, it is a pullet.

In a market fowl, the breast is the main thing, but in order to obtain a desirable breast it is necessary to have a good body first. So far as actual quality is concerned, the color of the skin is of no importance. But when the market calls for a yellow skin it is important that only such be served. Poultrymen can neither afford to quarrel with the demand, nor try to reform it.

* * *

Ducks are practically immune from cholera. Their favorite diseases are spinal meningitis and paralysis.

* * *

Ducks kept on land, must have deep drinking vessels, so they can get their heads under water. Where shallow vessels or troughs are used they gum up about the eyes, become listless, sit about, lose their appetite and eventually die.

* * *

On farms having high, dry land, which has a light growth of grass, and where a new breeding gobbler has lately been introduced, the largest flocks and the most thrifty looking turkeys are found.

* * *

It is an old belief that geese or their droppings will kill grass or destroy a pasture. The writer has a flock of six geese on a quarter acre of pasture, and, notwithstanding that geese have been on it for several years, it is as strong and vigorous in growth as ever; in fact, it seems to be in better condition than it was before geese were turned on it.

* * *

In closely built houses, where there is poor ventilation, the air becomes contaminated by gasses arising from filth and the accumulation of drop-

pings. As the hens are exposed to these gases during the night, it is no wonder that the system becomes poisoned by them and disease results.

* * *

Scummy drinking vessels cause sickness. They should be scalded out every now and then. Filthy water drank daily is very irritating to the bowels. Water is the principal constituent of the flesh, bones, feathers, and eggs of fowls, and necessarily large quantities of it are consumed daily. Therefore it should be seen that the water supply is not only pure but fresh.

* * *

There is a poisonous fungus growth in the blood in nearly all the fatal diseases. Fowls never perspire, so that, many of these evils may be thrown off: On the contrary, they must resort to respiration. The result is that the great majority of poultry diseases are found in the head, throat and lungs, and, therefore, it is in these parts that we must look for the symptoms of disease.

* * *

When eggs are candled, and show a pale, greenish hue, and the yolk wobbles around in a weak, watery white, they are called "grass eggs." If cooked they have an unpleasant flavor. When a hen is made sick eating too freely of grass, she lays these kind of eggs.

* * *

It is claimed that in laying an egg the pullet parts with about 1-60th part, by weight, of the total solid nutriment of its own body.

* * *

When mating to produce table poultry, the cock should never be even moderately long-legged, unless the hen is unusually short-legged, for the cockerels from such a sire will be gawky and stilty in form when sent to market at an immature age. His breast should be broad, full and round, and his back braod.

* * *

The most notable growth of the duck is between the third and fourth week of its age, when it often doubles its weight.

* * *

"Shorts," according to Webster, is the "bran and coarse part of meal, in mixture." In some sections of the country bran is known as "shorts," and in other places middlings bears that term.

* * *

The average weight of goose eggs is about 5 1-2 ounces each.

* * *

In an egg of 1,000 grains, 600 belongs to the white, 300 to the yolk and 100 to the shell.

* * *

In 100 parts of the yolk, 52 per cent is water, 45 per cent is oil and fat, and one per cent each of albumoids, coloring and mineral water.

* * *

In 100 parts of the white of an egg, about 84 per cent is water 12 1-2 per cent is albumen, one per cent mineral and 2 1-2 per cent sugar, etc.

Newell and Gordinier, Dept. B, Troy, N. Y., are the manufacturers of the Kay-King-O'Leg Bands. They are endorsed by breeders and fanciers as the acme of perfection in leg band manufacture, made in nine colors, absolutely indestructible and light as a feather, made to fit any breed. Write them for sample bands after reading this issue.

LIGHT BRAHMA BANTAMS

In addition to the splendid work being done for Light Brahmas by the American Light Brahma Club, this growing organization is championing the beautiful little Bantams of this same variety.

President Joseph Elias, of Philadelphia, has appointed a committee to devise ways and means for increasing the interest and breeding of these bantams. This committee, with Wm. F. Reardon, of Worcester, Mass., as chairman, and J. Hart Welch, president of the American Bantam Association, and Harvey C. Wood, secretary of the A. L. B. Club, has just started work by securing pledges of $40.00 as the nucleus of a fund for special prizes. It is proposed to offer cash specials and cups at leading eastern and western shows this nex season to encourage the exhibiting of these bantams.

Smaller reproductions of the club special metal badges will be offered at many shows and it is proposed to award cash and cup specials in both the east and west about March 1st, 1916, on the basis of a member's winnings on these bantams, from September, 1915, up to that date. The advantage of increasing the number of Light Brahma Bantams at the shows throughout the country is recognized so that the committee is endeavoring to arrange some of the awards on the basis of the amount of entry fees paid from Sept. 1915 to March 1916, by the different contenders. For example, the exhibitor at the small fair or show will pay an entry fee of twenty-five or fifty cents and makes six entries for just what it costs another to make one entry at some big show, where thousands of people will see this specimen, are pretty well balanced in the opinion of the committee, so that in casting up the points each will be credited with three hundred as each has spent $3.00 entry fees. In the course of a season one breder may have entered several specimens at a number of comparatively insignificant shows so that they were seen by probably no more people than were the few specimens shown by another breder at possibly only one or two of the very most important exhibitions.

In any event, Light Brahma Bantam Breeders are going to find it worth their while to come out with good strings of good birds this coming season.

Since the officers and members of the American Light Brahma Club are willing to undertake so much for L. B. Bantams they feel that breeders of these miniature L. B.'s should join the club, so that all these ribbons, cups, and cash specials will be awarded only where the win has been made by a club member.

Secretry Geo. L. Young, of the American Bantam Association, has written Secretary wood that he knows of no other specialty club among the fowl breeders that is now actively engaged in pushing the breeding of the bantams of that variety.

Secretary Howell, of the Grand Central Palace (New York) Show, has put in his word of encouragement by offering four beautiful special ribbons on Light Brahma Bantams at their show in December, in addition to a valuable silver cup for best display. It is confidently expected that other show asociations will co-operate with the club when it is seen what is being undertaken for Light Brahma Bantams.

The American Light Brahma Club Year Book contains two interesting articles on L. B. Bantams. This book is sent free to members and for 25c to others. Membership in the club to October 1st, 1916, costs only $1.00. Send your aplication to Harvey C. Wood, Secretary, Bound Brook, New Jersey.

This view of this really charming pullet illustrate the perfection of her hackle and her three rows of tail coverts—both points much coveted by breeders of the variety. Add this to a white back and a black wing and you nearly have perfection. The pullet has all these and compares favorably with the best of the large Brahmas shown.

Poultry Doings for the Year.

Shade Is of Vital Importance During the Summer Months. Males Should Be Taken Away From the Females After the Breeding Season. General Comments. By Mr Frank Conway.

IN my last month notes I mentioned the importance of affording shade during the hot summer months for both the young and old birds, a point that should not be overlooked especially during this month and the following months, August and September. It has been my experience that where no protection is given to the chicks from the direct rays of the sun the young chicks seem to flag in their growth and do not feather out nearly so quickly as when given shade in some form making their surroundings cooler and assuring a more uniform growth, which is what every poultry raiser should aim for, not only this, but the color is much preserved no matter what variety you may be keeping. It only stands to reason that to allow no protection at all from the hot sun a certain amount of sap is absorbed from the young feathers, causing them to hang in growth or in other words "quill bound," leaving a break in the web of the feather which in time breaks off, this especially applies to the older stock, not only this, but one will invariably find if breeding the black varieties, that purple barring will be more in evidence instead of that green sheen so much desired and the buff varieties are more apt to produce white feathers, most of cially in the flight feathers, most of which is attributed to no small degree to the lack of care and attention during moulting.

Those who have hatched out all the chickens they require for this season should break up the breeding yards and take the males away from the females and the latter can be run in large flocks and allowed to roam if possible, in some shady orchard or wood, and the breeding yards allowed to rest by growing some rape previous to which a good sprinkling of air slaked lime has been applied to the ground. The males that are intended for fall and winter shows should be kept in a small coop. There is nothing so handy where one has several spare males as several cockerel coops, in fact, no poultry plant where birds for exhibition are bred can afford to be without them, not only can they be used for males, but make ideal coops for half grown chicks which can be moved about to fresh ground from time to time.

Here are the dimensions of a very practical coop I brought out several years ago and have become popular on several plants in England and can be made out of ordinary box lumber, so long as it is not too heavy. The coop is 6 ft. long, 3 ft. 6 in. wide; 3 ft., 6 in. high in front and 3 ft. high at the back. The roof of the house is made to protrude 16 inches over the front. Half of the front is boarded up and floored, having no partition and the other front half is left open. Then make and enclosure to fit in front of the coop measuring 6 ft. long, 3 ft. wide and boarded up to 3 ft. high all around, over which stretch 2-inch mesh wire with a hole cut in the top so you can feed and water the bird in the cups that are fastened inside the enclosure at a convenient height for the bird to feed out of and made moveable for easy cleaning. The whole enclosure is made box shape and detachable, so that it can be easily moved. The coop itself is placed so that the sun is at the back, with the idea that the 16 inches of roofing that protrude cast a shadow over the enclosure and the birds never get any sun whatever. These coops are moved about from time to time on to fresh grass and if there is only one to do the moving a simple way is to procure a round pole 3 or 4 inches in diameter and a foot longer than the width of the coop. This is placed under one end of the coop which acts as a roller and one good push at the opposite end will practically place the coop on fresh ground, avoiding much heavy lifting. These coops will be found of great service where natural shade is at a premium.

A mash feed that has been scalded and dried off to a crumbly state will be found very helpful during this time of the season, fed to the old stock twice to three times a week in the mornings, preferably, into which has been added a tablespoonful of flour of sulphur to every 12 birds. There is nothing finer to give the birds at moulting time than sulphur as it purifies the blood and keeps the birds in general good health and eliminate to a certain degree the tendency to quill bound feathers, not only this, but with white birds the color will be much improved. If you have some hens intended for show and wish to get an early moult nothing is better than to allow her to hatch out a few chicks, if she shows any inclination to set.

By doing this, she will have a more uniform moult and has the chance to pick up a variety of tit-bits which the chickens leave.

A good mash feed is made up of the following: 1 part of white corn meal, 2 parts of flaked oatmeal, 2 parts of whet bran, a small quantity of dried beef scraps; scald well and dry off with middlings until made into a crumbly state, which binds easily when making into a ball but falls to pieces when dropped on the ground. Add the sulphur above mentioned to this.

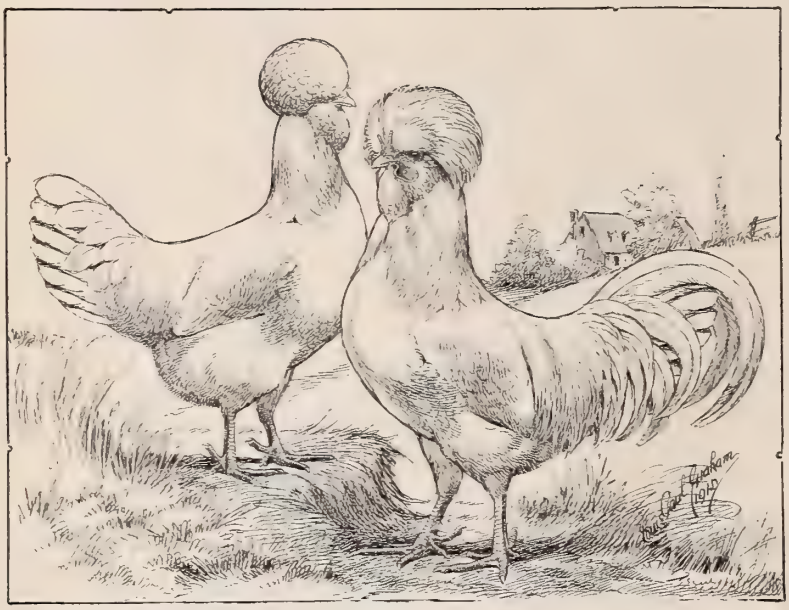
WAKE UP! HOUDAN BREEDERS

If You Don't, Your Mottled Favorites May Soon Be Second Choice--**By Louis Paul Graham.**

THE Houdan Breeders of America seem to be divided into two rival camps, one section favoring the large almost black type of fowls. The other, the old and rather obsolete, heavily mottled specimens. Between them there appears to be little effort made to get together for the general advancement of the breed, but each is intent on having their own pet ideas adopted in toto by the other side.

The poultry press has been filled with considerable writing on both sides for several years, and thus far honors appear to be about even. It appears to be about time for all the members of the Houdan club to get together, and settle once and for all, just about what is the amount of mottling on a Houdan that will suit all breeders. The American Standard of Perfection requires about one feather in five to be tipped or mottled. To the "Darkies" this is "impossible--too light"—and to the other side, this is much too dark and not at all like the original Houdan. This last is true, but the substitution of the spike comb for the huge and clumsy leaf comb. The increase in size (even though Creve Couer blood may have been used) and the darkening of the general color making more of a balance between white and black, have all been distinct improvements to the original Houdan and certainly have had the effect of making it look more like a thoroughbred than a barnyard fowl.

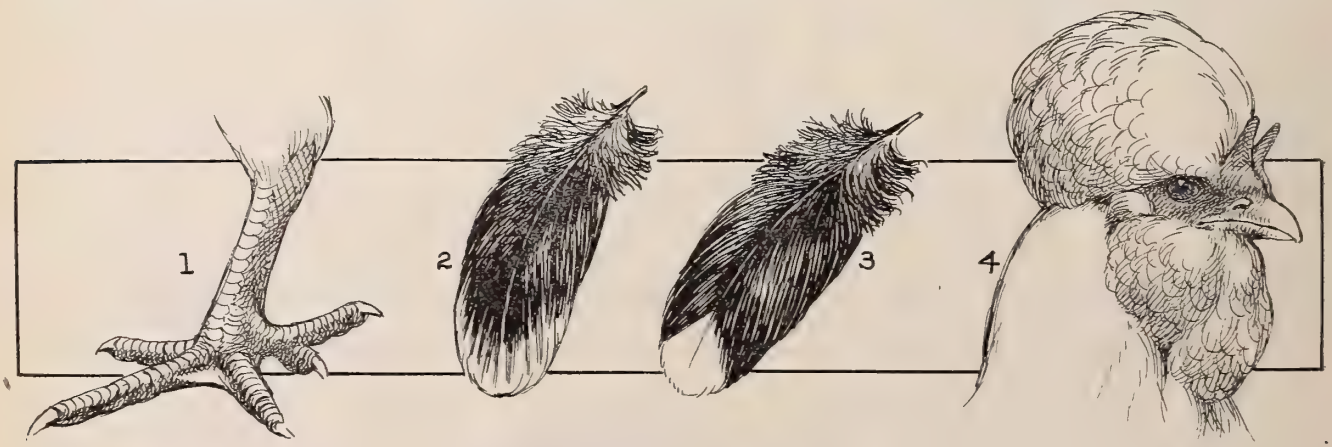


Outlines of Houdan male and female, representing the best types seen in our exhibitions.

The Houdan bred and exhibited in accordance with our standard description, is truly a beautiful fowl, even though the tipping may not be absolutely white, if it is evenly placed about in the proportion of one to five and each main tail feather and secondary flight tipped and free from solid white feathers in flights, tail or crest, it makes a mighty interesting problem to breed and certainly a handsome fowl to see. Houdans have genuine utility qualities which should recommend them to many who contemplate breeding a beautiful fowl and at the same time desire plenty of eggs and table poultry. It therefore behooves the breeders of this variety to get together in real earnest, settle their differences and commence a campaign which will exhibit to the public the genuine worth of this fowl.

In the meantime, judges who officiate on Houdan classes will do well to stick strictly to the Standard description in placing their awards and not allow themselves to be influenced by either of the warring factions.

The mottled Houdan is one of our oldest and most respected breeds. It is a native of France, where it is much esteemed as a producer of large white eggs and its poultry makes excellent meat--broiler size to maturity. Like all good things on the other side of the pond, Americans found them out and imported them and aside from a brief boom in their early history in this country, they have steadily declined in public favor despite their undeniable worth and today they are practically bred by the old "dyed-in-the-wool" fanciers who will never de-



HOUDAN CHARACTERISTICS

No 1 represents the the imperfect fifth toe which is often found on some of the very best colored specimens. It is considered by many to indicate a predominance of W. C. Black Polish blood in the specimens. The fifth toe of the Houdan should be entirely separate from the fourth and issue from the foot directly above the latter.

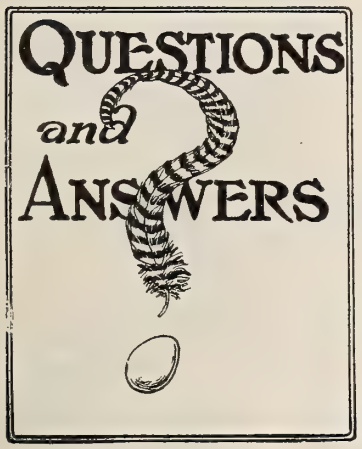
No. 2 represents an imperfectly Mottled feather. The type of tipping should be like No. 3—triangular—and this White tip should be free from black or gray streaking. True, there are precious few specimens exhibited with pure white tips, free from gray, but this nevertheless should be the ideal of every Houdan breeder.

No 4 shows the imperfect or insufficient crest, many of which are reared each year, even from the heaviest crested specimens. This seems to be a reversion to the type of crest, commonly found on Houdans in their home country—France, where their average laying qualities appear to be better than in America, at least it is so reported.

sert them. This decline can be blamed almost entirely on the dissentions between breeders over color and if Houdan breeders really are as much for their favorites as they profess, they will get together in a hurry and take progressive steps toward reinstating this grand fowl in its proper place.

Within a few years a certain enterprising and energetic breeder has developed a white Houdan. Many specimens have been exhibited and all have been above reproach as Houdans in type and characteristics and are certainly a pleasing and worthy addition to our list of thoroughbred fowls. At the Chicago Convention of the American Poultry Association, this variety was admitted to the Standard and it already enjoys considerable popularity.

If the Mottled Houdan breeders persist in agreeing to disagree they may soon be discomforted to find the White Houdan fast becoming the more popular of the two varieties.



QUESTIONS AND ANSWERS.

In this department we will answer questions, pertaining to poultry. It is for the free use of our subscribers. When special information in regard to diseases, etc. is desired, same will be funished by mail to avoid delay. Ask your questions, let us help you.

Q. Will you kindly give me your advice on caponizing. I will welcome any information you can extend me in this particular. Mrs. W. D. T.

A. We believe in caponizing, particularly where the number of cockerels is large. If you will address G. P. Piling & Son, Twenty-third and Arch streets, Philadelphia, Penna. (Note their ad. in Everybodys.) They sell instruments and will also supply a book with all instructions. After being caponized, the bird becomes more quiet and they are more readily fattened. The prices of dressed capons range very high. The highest prices usually prevail from January to May and the larger the bird, the more they bring a pound. The well grown capon will average from ten to twelve pounds at one year old.

Q. Do you know of any substitute for commercial beef scrap. It is almost impossible for me to secure a good grade of beef scrap and if you can recommend something that will take its place will be pleased to have you give this information through the columns of your valuable poultry publication. D. W. F.

A. The only substitute for Beef Scrap we know of to recommend is green cut bone. If it is possible for you to get green bone, it would be a good idea to have a grinder and to use this regularly. If it is impossible for you to get green bone, write to us again and we will recommend to you some high grade beef scrap that can be had.

Q. Wish you would advise a remedy for a hen of mine. She has a rattling noise in neck and a cold. I have tried different remedies. It seemes to stop sneezing, but has no effect on rattling. She lost in weight from eight to five pounds before I gave her medicine, but has regained her weight and is laying now for about one month. She looks healthy, but I don't like the rattling noise in her throat. H. S. B.

A. Your hen evidently has a case of chronic bronchitis. Where this becomes chronic it is rather hard to cure. Would advise you to address the King Remedy Company, 21 Elm Street, Rochester, N. Y. (Note their ad. in Everybodys.' Would advise you to hold the bird's head over the steam of a boiling kettle and give four or five drops ipecacanha wine every three hours.

A couple of teaspoonfuls of glycerine or sweet oil, warmed, should be given every night for a few days and the bird should be kept in a moderately warm and dry room.

Seymour, Conn.
Everybodys Poultry Magazine,
Hanover, Pa.
Gentlemen:

Q. Where several cock birds are wintered over for breeding what is the best way to keep them: together or separate, providing they are not allowed to run with the hens, who, if cocks birds are thrown in together and allowed to fight it out, will those that are whipped prove any the less value for breeding the following sprin? L. E. K.

A. Cockbirds if intended for next year's breeding had better be kept by themselves. After the birds begin to moult we often turn several together and note that they do very little scrapping at that time and seem to live as a happy family all together where there are no hens. If birds at this season and before they moult are put together they are very apt to fight long and hard and to injure themselves. We should then advis the best of care taken of cock birds, particularly after two years old and if they are wanted for breeding purposes.

JUDGE J. H. DREVENSTEDT
IN THE AMERICAN FANCIER OF JUNE 19TH, SAYS:

"June Everybodys Poultry Magazine was one of the early birds of the big poultry monthlies to reach our perch. Being the third issue under its present management and attractive new name, it is, if anything, even more interesting than initial and succeeding issues. Everybodys is living up to its name, being a poultry magazine well loaded with chicken lore and news gathered by a bunch of noted and able contributors. It is well printed and illustrated between its covers, the front cover being unique in design, the monthly changes of standard-bred variety illustrations showing Artist Louis P. Graham up at his best. We extend to Editor Henry P. Schwab and his able staff our congratulations on the excellent appearance and clean-cut policy of Everybodys Poultry Magazine.

* * *

"There is one article in Everybodys Poultry Magazine for June which will be read with interest by every Barred Rock breeder in this country, and that in the one contributed by H P. Schwab on the origin, characteristics, mating, breeding, value of shape and color of the Barred Plymouth Rock. Barred Rocks are Hank Schwab's hobby. He has bred them many years and has judged them at our leading eastern shows almost as long. No other breeder or judge has had a better opportunity to study the fine points of the highest type of Barred Rocks than the Ba'd Eagle of Irondequoit, N. Y. He has handled the Rock classes at the Madison Square Garden so often in the past decade that about all the choicest males and females, young and old, bred in his neck of woods, confronted him year after year at the historic old Garden Show. The experience gained there has been invaluable to Henry P. Schwab in giving to the public his views on what the Modern Barred Plymouth Rock should be in order to trot in fast company."

FOXHURST FARMS
Specal Sale
S. C. Black Orpngtons

The Foxhurst Farms, Lime Rock, Conn., are now offering some of their very best breeding stock for sale that those who are interested in select Black Orpingtons should take advantage of. GRAHAM'S CRACKERS

By LOUIS P. GRAHAM, Vineland, N. J.

THERE seems to be considerable demand for the poultry judge to remain in the show the next day after judging and explain his awards to the exhibitor.

The average tenor of the remarks appear to place the blame on the judge. One critic, in an apparent attempt to curry favor with small breeders, even goes so far as to say "As soon as he (the judge) gets his mazuma, he beats it."

Of course and why not? His work is finished as agreed and there is no intelligent reason for this man to stay on at his own expense in order to explain awards. Most judges are glad to do this in their spare time, between judging and leaving, but to require and demand this service without pay is "something else again.'

Associations hire your judges and pay them for this extra day and see how quick they'll stay.

* * *

It is scarcely creditable that the theft of a few half tones early in January, intended for use in the much waited for Standard should delay the publication of that book several months.

If these half tones were made the drawings, of course, were complete, (otherwise the half tones could not be made. With the finished drawings in hand a week or ten days would have been more than ample time in which to secure a new set of plates and proceed with the printing of the book.

At that rate it should have been published and distributed about ten days later than March 15th, the date set and advertised for its appearance in public.

It seems as though the thousands of fanciers and breeders who have been compelled to mate and breed without knowing what is required by the new Standard, have a perfectly good kick coming and are entitled to know why it has taken so long to get the book and who is at fault.

* * *

At the Atlantic City Convention of the American Poultry Association, a certain little blood and thunder editor made the statement that "the decline in poultry business was due to editor-judges," but failed to state just how editor-judges strangled the everlasting daylight out of the business. In fact, he can't say how, when or where, or prove a single assertion he has made at any time. Everyone recognized that this man was simply seeking self-advertising, that there was no truth in his assertion and dropped the subject. He has been buried two years.

Now this little B and T editor bobs up again with the same line of thought hoping to start something for the same reason as before—self-advertising.

The real reasons for the mushroom growths and sudden deaths of embryo poultrymen can be laid to the door of this B and T editor and a few others of his type. They seize on the novice who has just won a prize or two in a small show, fill him full of the old reliable "bull" swell him up with importance until he feels that, instead of being a rank novice with no immediate prospects of competing with the big breeders of the country for several years (or at least until he learns how, establishes a strain and makes a reputation), why he is just as big a man as the best—can meet them on their own grounds and beat them, and then signs up an advertising contract with the B and T editor for 120 inches or thereabouts. Then the other editors and advertising solicitors (excepting a limited few) seize on the "lamb" and shear him for just as many inches in each of their imitations of poultry papers. They tell him how advertising will make him great and well known, and what it will sell for him and when show season closes the lamb departs, to learn by several months of bitter experience that customers don't buy just because of his big advertisments. There must be reputation and performance back of his advertisements or there will be few customers and even those will feel that they have been swindled. Meanwhile the advertising bills mature and the chap who slapped you on the back last winter and predicted great things for you (when you were signing his contract) now figuratively grabs you by the throat and snarls, "pay me what thou owest."

Sometimes you can't pay and you bid a glad good-by to the poultry business. Others, by scraping money from some other source, pay up and quit too, and all say it is an expensive business—nothing in it.

Verily I say unto you, hundreds of good prospective poultrymen, competent to take their places with the best after several years careful experience, have been drowned in the first or second year by the millstone of "over-advertising" hung around their necks by the B and T editor and others of his type.

This will always be the crying shame of the poultry business, until all poultrymen unite to discourage and drive out of the poultry business all grafters of this type.

* * *

The list of judges for the Panama-Pacific as announced is certainly not the best selection that could have been made. Many causes have contributed toward the non-engagement of many of our most competent judges. The breeders of the east have reason to congratulate themselves over this condition as it still leaves most of the best judges available for service at the old reliable established and deserving local shows being held on the same dates. These shows

This cock was of remarkable quality in blue color and narrow straight barring. This, combined with good head, legs, and splendid Rock shape, made him an easy winner. In fact the quality of this fowl was equal to winning in much better company.—Louis Paul Graham.

Barred Plymouth Rocks.

L. Ressequie, Millers, N. Y.

Mr. H. Armstrong Roberts, of Beverley, N. J., says: "My flocks, old and young alike are in the pink of condition, which means heavy egg-yield, fertility and vitality. They are all fed a mash containing—

French's Poultry Mustard

Send for a 32 page booklet telling more about Mustard and it's relation to poultry an egg-production.

THE R. T. FRENCH CO., Dept. E., Rochester, N. Y

should be supported by all exhibitors regardless of the Panama-Pacific.

It is inferred that other judges have not been asked because of personal prejudices, regardless of their ability, and in other instances the lack of an A. P. A. license is given as an excuse.

* * *

Such is life! A few short months ago a certain breeder was pic-among the "who's who' and written up in glowing terms by one of our contemporaries. Now the same man is published in lurid terms as a fraud. It is some speculation as to which is the true account.

The first is obtainable for money and the last is ofttimes the revenge for stopping the flow of money. Truly this poultry business is becoming strictly commercal.

WHAT IS IN A NAME?

After several years careful breeding H. V. Tormohlen, Box 1, Portland, Ind, decided he was well on the way to combine the wonderful utility qualities of the old time brown Leghorn with the beautiful Brown Leghorn of the show room. The Brown Leghorns became famous 50 years ago as the greatest egg layers on earth and they are the ancestors of all the other different varieties. The Browns lost some of their utility qualities in being bred for the show room.

About ten years ago when Mr. Tormohlen felt he had been fairly successful in combining the utility qualities of old with the modern show room beauty he decided upon a strain name and since then his famous "Everlay" Strain has become well known in all the leading shows of the United States. Each year his winnings have been more extensive and the popularity of his wonderful layers of large white eggs has increased. As an example last season he won more firsts and seconds at Chicago, Cleveland and New York than all others combined, in fact winning nine firsts out of a possible 12 on single entries.

Imitation is the truest type of flattery so we have often heard, and it seems true in Mr. Tormohlen's case, for others have arisen to profit by his many years labor in perfecting his strain and have even appropriated the name for other varieties.

The United States government has recently recognized his exclusive claim to the word "Everlay," as applied to all poultry and eggs for breeding and hatching purposes by duly registering the same under number 104,364 in the trade mark division of the patent office. This should be due notice to the poultry public that there is one and only one "Everlay" Strain and that perfected by H. V. Tormohlen, Box 1, Portland, Ind.

SUNSWICK SPECIAL SALE BUFF ORPINGTONS

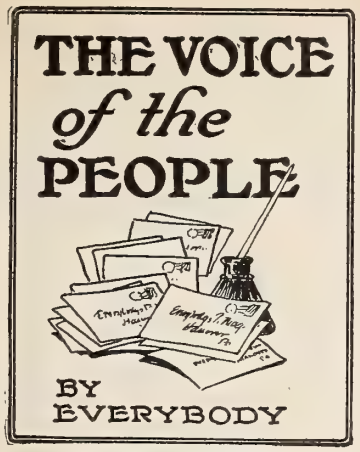
The Summer Sale List of the Sunswick Farms, So. Plainfield, N. J., received, in which Mr. Delafield offers for sale a special line of choice birds. This line of Buff Orpingtons has been bred, and has been a consistent winner so long that its record is Buff Orpington history. They have won at our largest shows including Madison Square Garden New York, Chicago, Boston, New York Palace Show, Williamsport, Philadelphia, Baltimore, Allentown, Etc., Etc.

Mr. Delafield informs us that he has an extra large and fine line of early hatched birds to offer. He can supply fine exhibition specimens for any show desired, while the breeder can have one reserved for him now by making part payment.

If you are in want of prime Buff Orpingtons that have the right breeding with quality to reproduce, send for this list and write them your wants. Address The Sunswick Poultry Farms Co., So. Plainfield, N. J. Everybody mentions "Everybodys" when writing advertisers.

AGENTS WANTED

We desire to have a reliable person to act as agent for "Everybodys" in every town and hamlet in the U. S. and Canada. Here is your chance. We pay CASH COMMISSIONS. Write for terms.



VOICE OF THE PEOPLE.

This department is for all matters of interest. Our readers are requested to send us such items of value and interest, also comments on questions of the day. All join in and make this a live proposition.

A YEAR WITHOUT A SUMMER

The year 1816 was known throughout the United States as the year without a summer. January of that year was so warm people would have let their furnaces go out had they possessed any, and February was only occasionally colder. March and April coaxed the buds and flowers out, and May was a winter month, with ice and snow. By the end of May everything perishable had been killed by the cold, and the young leaves had been stripped from the trees. June was as cold as May. Both snow and ice were common throughout the month all over the corn belt, and after having planted corn two or three times the farmers threw up their hands. Snow fell 10 inches deep in Vermont. The following winter was the hardest the people of the United States have ever known One had to have a stockade around one's smokehouse.

* * *

THE PERPETUAL WAR

In nature the beast of prey must be reckoned with when his domain overlaps that of man. The assertion is made by government authorities that predatory animals—bears, wolves, coyotes, mountain lions and wildcats cause a loss of $15,000,000 annually to owners of live stock in the United States. A law has been enacted appropriating $125,000 to be used in destroying these wild creatures. One wolf, it is said, will do $1,000 worth of damage in a year to the flocks and herds he can reach. Outside of man's realm the warfare never ceases, the lion and the lamb do not lie down together.

F. H. R.

* * *

ORIGIN OF "HURRAH"

"Hurrah" was originally a fighting exclamation and is derived from the Slavonic "Huraj"—"To Paradise!"—the belief that valiant fighters went straight to heaven if killed.

* * *

We said in a recent issue of this magazine that the filthy conditions under which much of the live stock of the country is kept were responsible for no small part of the $3,399-110 loss caused by the late outbreak of the foot and mouth disease. A farmer of large experience writes to a leading journal: "I have an old friend who for many years has bred and fed annually two or three carloads of hogs. He avoids filth. He disinfects liberally. He has no cholera. Certain conditions well adapted to hog cholera must exist before it can flourish. With proper feeding and sanitation there can be no outbreaks of hog cholera." The same is true of the foot and mouth disease. All kinds of animals, men as well as cattle, sheep and swine can be saved vast burdens of pain and loss by so simple a prophylactic as cleanliness.

Buffalo, N. Y.

In these columns we will, month by month, describe the most common and valued birds, giving in particular their feeding habits, etc., founded on tests made by experts. Let us all know and appreciate the birds at their full worth.

COMMON BIRDS OF THE FARM AND ORCHARD

(Farmers Bulletin 513)

This bulletin is intended to serve the very practical purpose of enabling our farmers and their boys and girls to identify the birds that frequent the farm and orchard. The material prosperity of State and Nationa depends largely on agriculture, and any agent that serves to increase the size of crops and insure their certainty is of direct interest and importance to the farmer. Birds constitute one of the most valuable of these agents, since they depend largely for their food on insects which are among the farmer's most dreaded foes.

Entomologists have estimated that insects yearly cause a loss of upwards of $700,000,000 to the agricultural interests of the United States. Were it not for our birds the loss would be very much greater, and indeed it is believed that without the aid of our feathered friends, successful agriculture would be impossible. A knowledge of the birds that protect his crop is, therefore, as important to the farmer as a knowledge of the insect pests that destroy them. Such knowledge is the more important because the relation of birds to man's interests is extremely complex. Thus, while it may be said that most of our birds are useful, there are only a few of them that are always and everywhere useful and that never do harm. Insectivirous birds, for instance, destroy, along with a vast number of harmful insects, some parasitic and predatory kinds. These latter are among Nature's most effective agents for keeping destructive insects in check. To the extent, then, that birds destroy useful parasitic insects, they are, harmful. But, taking the year round, the good they do by the destruction of insects injurious to man's interests far outweighs the little harm they do. It may be said, too, that of the birds usually classed as noxious, there are very few that do not possess redeeming traits. Thus the crow is mischievous in spring and sorely tries the farmer's patience and ingenuity to prevent him from pulling up the newly planted corn. Moreover, the crow destroys the eggs and young of useful insectivirous and game-birds; but on the other hand, he eats many insects, especially white grubs and cut-worms, and destroys many meadow mice, so that in much (although not all) of the region he inhabits the crow must be considered to be more useful than harmful. Most of the hawks and owls, even birds that received so bad a name that the farmer's boy and the sportsmen are ever on the alert to kill them—are very useful because they destroy vast numbers of insects and harmful rodents.

Birds occupy a unique position among the enemies of insects, since their powers of flight enable them at short notice to gather at points where there are abnormal insect outbreaks. An unusual abundance of grasshoppers, for instance, in a given locality soon attracts the brids from a wide area, and as a rule their visits cease only when there are no grasshoppers in the number of small rodents in a given neighborhood speedily attracts the attentin of hawks and owls, which, by reason of their voracious appetites, soon produce a marked dimunition of the swarming foe.

BLUEBIRD (Sialia Sialis)

Length about 6½ inches.

Range: Breds in the United States (west of Arizona, Colorado, Wyoming and Montana), southern Canada. Mexico, and Guatemala; winters in the southern half of the eastern

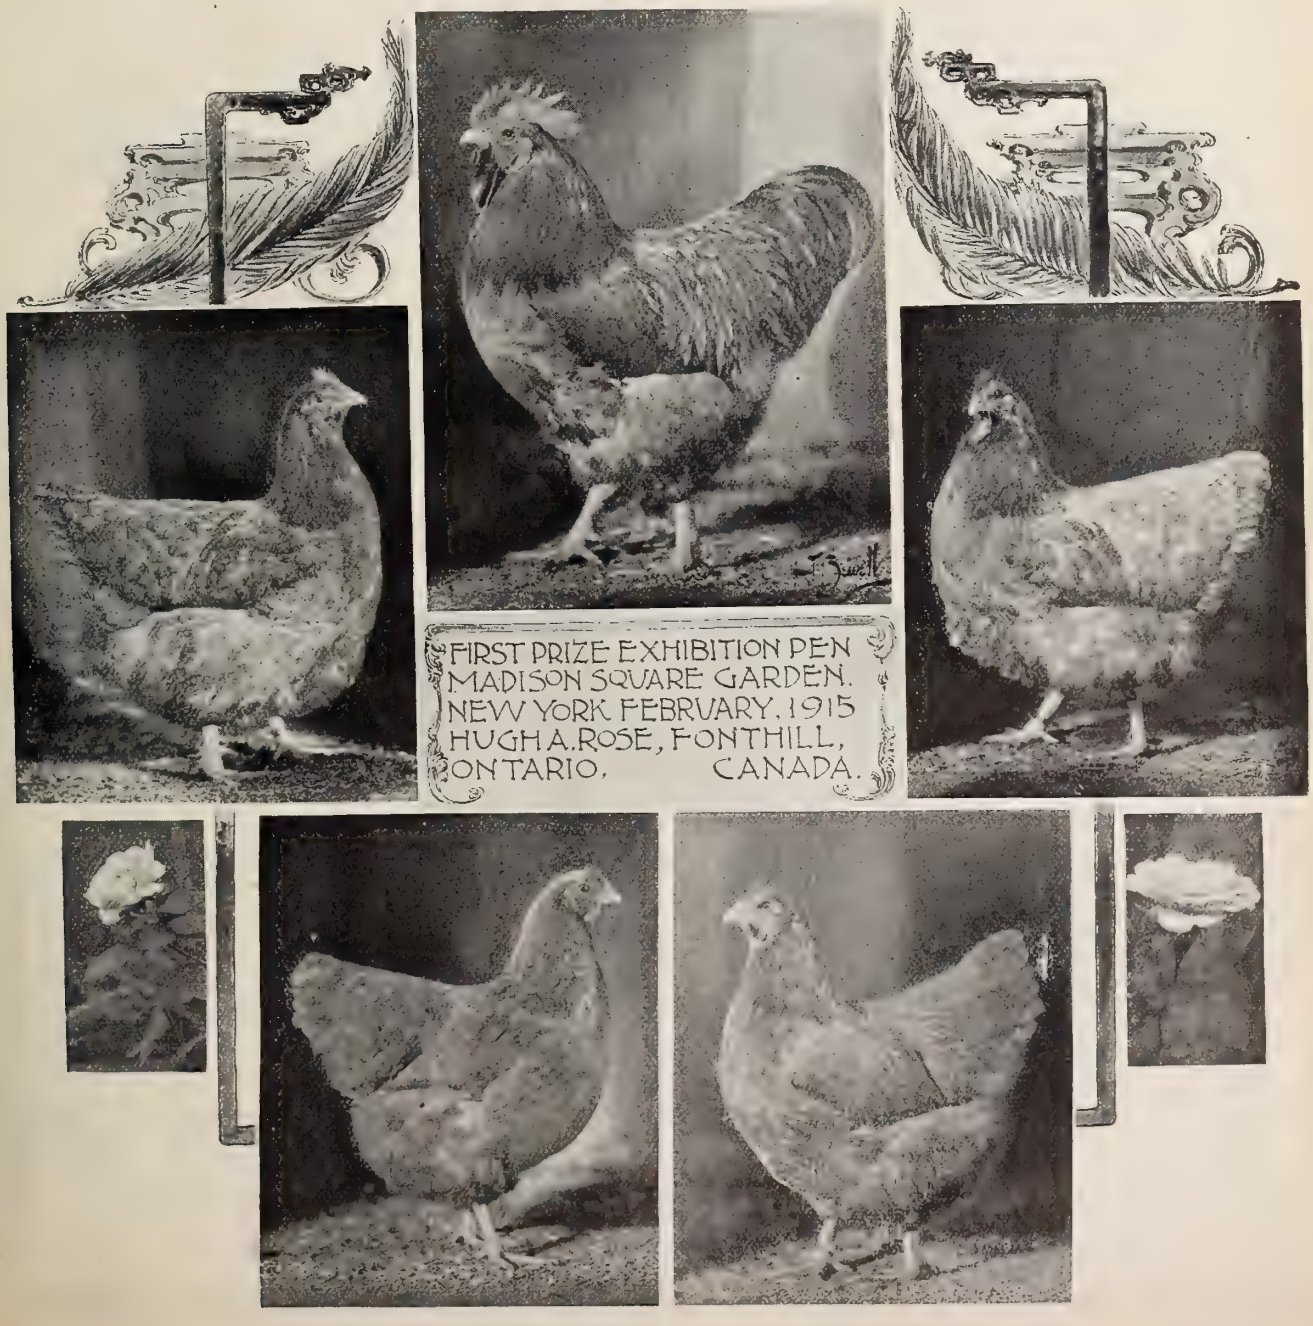
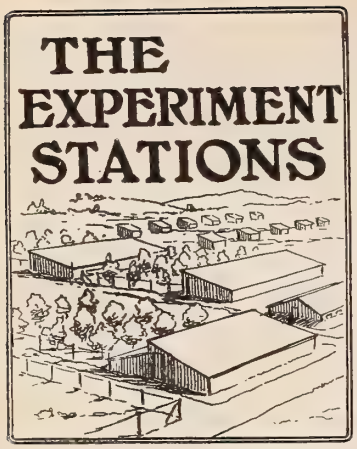
Habits and economic status: The bluebird is one of the most familiar tenants of the farm and dooryard. Everywhere it is hailed as the harbinger of spring, and wherever it chooses to reside it is sure of a warm welcome. This bird, like the robin, phoebe, house wren and swallows, is very domestic in its habits. Its favorite nesting sites are crannies in the farm buildings or boxes made for its use to natural cavities in old apple trees. For rent the bird pays ample by destroying insects, and it takes no toll from the farm crop. The bluebird's diet consists of 69 per cent of insects and 32 per cent vegetable matter. The largest item of insect food are grasshoppers first and beetles next, while caterpillars stand third. All of these are harmful except the beetle. The vegetable "food consists chiefly of fruit pulp, only an insignificant portion of which is of cultivated varieties. Among wild fruits elderberries are the favorite. From the above it will be seen that the bluebird does no esential harm, but on the contrary eats many harmful and annoying insects.

The bluebird has not been accused so far as known, of stealing fruit or preying upon crops. An examnation of 855 stomachs showed that 68 per cent of the food consists of insects and their allies, while the other 32 per cent is made up of vegetable substances, found mostly in stomachs taken in winter. Beetles constitute 21 per cent of the whole food, grasshoppers 22, caterpillars, 10 and various other insects 9, while a number of spiders and myriapods, about 6 per cent comprise the remainder of the animal diet. All of these are more or less harmful, except a few predacius beetles, which amount to 9 per cent. In view of the large consumption of grasshoppers and caterpillars we may at least condone this offense, if such it may be called. The destruction of grasshoppers is very noticeable in August and September, when these insects make up about 53 per cent of the diet.

It is evident that in the selection of its food the bluebird is governed more by abundance than by choice. Predacious beetles are eaten in spring, as they are among the first insects to appear; but in early summer caterpillars form an important part of the diet, and these are later replaced by grasshoppers. Beetles grasshoppers are more easily obtained.





THIRD ANNUAL CONVENTION OF MASSACHUSETTS POULTRYMEN.

On July 21st to 23rd the poultrymen of New England will meet at Amherst, Mass., in connection with the annual convention of the different poultry associations of the State of Massachusetts. This convention is fostered by the Department of Poultry Husbandry, of the Massachusetts Agricultural College and through the efforts of Prof. John C. Graham, the head of this department, a great gathering of poultrymen can be expected.

Prof. Graham has arranged a program which will be of wonderful interest to all poultrymen, and as will be seen has secured as speakers some of the most able authorities on poultry topics in the country.

The three days' convention will be fully taken up with this program which provides for both morning, af ternoon and evening lectures.

The program for each day is as follows:

WEDNESDAY.

Lecture: Bee Culture as a Side Line for Poultry Keepers; Dr. Burton N. Gates, Associate Professor of Beekeeping, M. A. C.

Lecture: The Revival of Turkey Raising in Massachusetts. Dr. Philip H. Hadley, Rhode Island State College, Kingston, Rhode Island.

Demonstration: (a) White Diarrhea Infection in Baby Chicks. Dr. George E. Gage, Associate Professor of Animal Pathology. (b) Visit to the Poultry Plant.

Lecture: Artifical Incubation. Harry M. Lamon, Senior Poultry Husbandman, U. S. Department of Agriculture, Washington, D. C.

Moving Pictures.

THURSDAY.

Lecture: The Solution of an Important Problem in Incubation. Dr. H. D. Goodale, Biologist, Department of Poultry Husbandry, M. A. C.

Institute Lecture: Given under the Auspices of the Massachusetts Poultry Association, Inc. co-operating with the Masschusetts State Board of Agriculture. Charles L. Wilder, President, Lancaster, Mass., presiding.

Lecture: Brooding and Growing Chicks; The Man, His Equipment and the Chicks. Professor James G. Halpin, head of Poultry Department, University of Wisconsin, Madison, Wis.

Lecture: In the Light of Present Knowledge and Conditions, What of the Future of Masschusetts as a Commercial Poultry State? Professor J. C. Graham, head of Poultry Department, M. A. C.

Address of Welcome. President K. L. Butterfield. Response, Dr. M. W. Sanborn, Holden, Mass.

This number is given under the auspices of the Massachusetts Poultry Society, Maurice F. Delano, President, Vineyard Haven, Mass., presiding.

Lecture: What Can the Poultrymen of Massachusetts do for the Advancement of Their Own Intrests? Grant M. Curtis, President of the Cyphers Incubator Company, Buffalo, N. Y.

Lecture: Profitable Squab Production in New England. John A. Kiernan, Proprietor, Hazelwood Squab Farm, East Providence, Rhode Island.

Lecture: The Demands of the New England Poultry and Egg Markets. F. S. Snyder, Boston, Mass.

Stereoptican Lecture: Personal Reminiscences of a Bird Man. Earl L. Ovington, Newton Centre, Mass.

FRIDAY, JULY 23.

Stereoptican Lecture: The Preparation of Poultry and Eggs for Market. Professor R. V. Mitchell, New Hampshire State College, Durham, New Hampshire.

Lecture: Experiments to Determine the Palatability of Poultry Mashes. Loyal F. Payne, Instructor of Poultry Husbandry, M. A. C.

Demonstrations at the Poultry Plant:

(a) Killing, Picking and Dressing.

(b) Caponizing.

Mr. C. J. Kelley, Foreman of College Poultry Yards, M. A. C.

Orchard Farm REDS

Reduced prices for hatching eggs during June and July.

A limited number of breeders and utility females for sale at fair prices.

ORCHARD FARM, - - Noroton Heights, Conn.

RED SUSSEX

Egg prices reduced this month. Sussex chickens have been hatched in the fall for years in England, to be ready for the fattening sheds the following spring. When given a place by themselves the birds grow rapidly. I usually have stock of all values for sale at reasonable prices. Some utility yearlings at this time. Late chickens of this breed do unusually well. Booklet free.

F. L. Platt, Swanton, Ohio

Egg-Bred Cockerels Now

direct from my Egg-Record Official Contest and Chicago Winners at war prices for quick sale. 100 utility females at $1.50. Trios at $6.50.

My absolute Guarantee of Quality given to all, write me to-day, please, for Mating List and wants. Address

Lester Tompkins, Box E. Concord, Mass.

REPORT OF THE STORRS EXPERIMENT STATION

The hens in the egg laying contest at Storrs yielded a total of 18,276 eggs for the month of May, or 1,532 eggs more than for month of April. This is not relatively quite as good as the yield for May a year ago, still it leaves the birds in the present competition 2,889 eggs ahead of last year. The following table furnishes a comparison for the first seven months between the present competition and its predecessor showing as it does the best pen in each of the breeds named.

Breed	1914	1915
White Wyandottes.....	1278	1202
Rhode Island Reds.....	994	1180
White Leghorns.....	1176	1073
Experimental pens.....	1191	1018
Plymouth Rocks.....	952	989
Average pen score all breeds	783	812

In reviewing the individual production it seems a bit unusual that not a single Leghorn is included in the dozen best individuals in the table below. This perhaps does not mean, however, that before the end of the year the lighter breeds will not be represented for it will be seen in another paragraph that the Leghorns are now coming very strongly. They won all the ribbons for the month of May.

The ten best individuals to date are as follows:

Barred Rock, No. 3 B'kf'd Ctre, Con. . . . . .154 eggs
Wh. Wyandotte 132 Catforth Eng. . . . . .148 "
R. I. Red, 261 St. Albans Vt. . . . . .147 "
R. I. Red, 410 Durham Conn 145 "
Barred Rock, 23 Mt. Carmel, Conn. . . . . .144 "
R. I. Red, 344 Temple, N, H. . . . . .144 "
R. I. Red, 173, Winsted, Conn. . . . . .143 "
Wh. Wyandotte, 142 Hoghton, Eng. . . . . .143 "
Bf. Wyandotte, 221 Holden, Mass. . . . . .142 "
Wh. Wyandotte, 153 Columba Conn. . . . . .141 "
R. I. Red, 420 Brdgeton, R. I. . . . . .141 "

Blue ribbon on first prize was won by Tom Barron's pen of Englsh Leghorns that laid 250 eggs during the month. A Pennsylvania pen of Leghorns, owned by Braeside Poultry Farm of Stroudsburg, got the second prize ribbon with a production of 245 eggs, while third place goes to a Connecticut pen owned by Windsweep Farm from Redding Ridge that laid 241 eggs for the month.

EXPERIMENTAL PENS—The experimental pens taken all together laid an even 1,800 eggs, or an average of 18 eggs per bird, whereas the average for the entire plant was nearly 18¼ eggs per hen. The table below gives the total yield of both the milk and no milk pens. During the month the sour milk pen of Brahmas considerably outlaid its check pen; in consequence the milk pens all taken together are now 487 eggs ahead of those that do not get milk, whereas they were only 273 eggs ahead a month ago.

Breed	Pen	No Milk	Milk
Barred Rocks...	5 & 6	643	974
Wh Wyandottes	19 & 20	777	921
R. Island Reds.	37 & 38	1018	854
Light Brahmas..	45 & 46	612	646
White Leghorns	59 &60	896	1018
Total		3946	4433

The ten leading pens to date are as follows:

15 Ed Cam, Hoghton, near Preston, England, White Wyandottes 1202
27 Hillview Poultry Farm, St. Albans, Vt., Rhode Island Reds 1180
14 Tom Barron, Catforth, nr. Preston, England, White Wyandottes 1162
73 A. P. Robinson, Calverton, N. Y., White Leghorns.... 1073
68 Tom Barron, Catforth, England, White Leghorns..... 1070
66 F. M. Peasley, Cheshire, Conn., White Leghorns.... 1067
37†Storrs Station (Experimental pen) Rhode Island Reds. 1018
60†Storrs Station (Sour milk pen) White Leghorns..... 1018
62 Windsweep Farm, Redding Ridge, Conn., White Leghorns 1017
33 Pinecrest Orchards, Groton, Mass., Rhode Island Reds.. 1013
35 Colonial Farm, Temple, N. H., Rhode Island Reds..... 1000
1 Merritt M. Clark, Brookfield Center, Conn., Barred Rocks 989

† Not in competition.

Wm. F. Kirkpatrick.

Homestead Campine Farm, Box H-2, Wayland, Mass., regular advertiser in Everybodys have established for themselves a reputation known to every Campine lover. These farms breed the Silvers in all their glory, and in the fullness of vigor, reared under ideal conditions and perfected by their owner, Mr. C. A. Phipps, who is doing much towards placing the Campines among our most profitable breeds, a place where they rightfully belong as all know who have watched their progress. This farm reports that they are now booking orders for Fall and Winter delivery, besides offering some special inducements for immediate delivery.

SCHOOL FOR POULTRY JUDGING

The School for Poultry Judging will be held in connection with the Indiana State fair at Indianapolis, Ind., September 7th to 12th next, with Mr. W. C. Pierce, Principal, in charge.. Any information desired in regard to the classes, etc., can be had by addressing Mr. W. C. Pierce, Hope, Indiana.

* * *

Mr. John S. Martin, Port Dover, Canada, is now mailing his annual Summer Sale List, in which is given a minute description of all stock offered for sale. Each year Mr. Martin has held a Summer Sale of stock, but never before has he listed so many fine specimens as are offered in this sale and at prices which are within the reach of all. Here, indeed, is an opportunity to secure some exceptional Regals, both in utility and exhibition specimens, which will be of inestimable value to any lover of White Wyandotte in their breeding and exhibiting during the coming season. Among the several special offers are a number of males sired by Sensation Regal VIII (1st Boston Cock) Crusador and other famous Regal males. Also Mr. Martin offers in this special sale, the 2nd Pen Cockerel at the New York State Fair, 1st Pen Cockerel, Allentown, and other 1915 winning males and questing this Special Sale List and we believe you will agree with us that the offers there listed are of extraordinary value. Mention Everybodys in writing J. T. H.

* * *

Sunswick Poultry Farm, South Plainfield, N. J., known the world over as the place where high quality S. C. Buff Orpingtons are bred, have issued a Summer Bargain Sale list, which will be mailed for the asking. This is indeed a unique list in that it describes minutely every bird listed, giving those interested all information required. Mr. Rufus, Delafield, owner of "Sunswick," always has something original up his sleeve, and the beauty of this list will appeal to all. Write him if interested, mentioning Everybodys.

J. T. H.

* * *

F. W. Dawson and Son, Williamsport, Pa., specialty dealers in poultry feeds, have established a reputation solely on the merits of the quality of feeds they are sending out. Their growing mash and chick intermediate is recognized by many of our leading poultrymen as near perfection in poultry feeds. No high priced catalogue to add to the cost of these feeds, but Messrs. Dawson will gladly write you fully describing their methods, etc.

J. T. H.

Young's Strain S. C. W. LEGHORNS

I Have No Other Breeds

Acknowledged throughout the World as being the standard for all the Leghorns and the leading strain of heavy layers. They have been bred in line since 1853, for heavy egg production alone, and the show birds have simply been chosen from the layers. They are the only original line bred strain of Leghorns in America today.

Why not come to headquarters and get the best?

Hundreds of yearling hens and cock birds for sale. Eggs at half price remainder of season. Mating list free. Address

San Francisco Meeting
By H. H. Collier

I LIKE Louis P. Graham. I never met him often, but I liked him just the same, but I don't like this pen of Louis Graham.

"The selection of San Francisco was mainly sentimental. Many voted for it under the assumption that it was "due" to the West. Few considered that the time selected is the same as the dates of the Panama Pacific Poultry Show, which is in direct contradiction of that provision of the constitution which provides especially that annual meetings of the A. P. A. shall not be held in conjunction with poultry shows."

Artists are supposed to be sentimental. If it were not for sentiment, Louis P. Graham would be splitting logs, acting counter jumper or in some other vocation rather than art. Louis P. Graham in his art appeals to the sentiment of poultrydom and sentiment sells his pictures. Every drawing or painting appeals to sentiment. Now, so much for that.

Louis P. Graham has not read his constitution thoroughly or he would know that a special provision was made in that constitution to take care of the meeting at San Francisco.

Again our friend Mr. Graham (I will not say Louis, for that would show sentiment), finds fault with the fact that he will spend a little money in bringing the officers to San Francisco. That is true and it is money wisely spent. It gives the officers an idea of how large a country over which they act for the poultrymen of the great American Poultry Association. From New York to Atlantic City is no long trip yet I saw men and women who acted as if they had been on a real journey, after making that trip. Mr. Graham should get that thought well into his mind. Buffalo is no longer the farthest point west and Chicago is not on the border land of nowhere. San Francisco is more than a "Sabbath Day's" journey from Vineland, New Jersey, but if Mr. Graham will just make this trip, I know that he will see a few things that are worth while and that he, as an artist, will be the first one to show his sentiment. He can come and see Mount Tacoma Raineer. He could see Pikes Peak, Mount Shasta would be one thing worth going the trip to see and then again there are the Olympic Mountains that border on the State of Washington and the Cascade that divide it. Mountains of course have little to do with the sordid things of the world, but their legends are full of sentiment and I know even a man so prosaic as our artist friend would try to make himself, would be wild, to use the girlish expression, over the things that will unfold themselves to him should he make the trip.

To get sentimental, Louis, we want you. We want you to make this trip. We want to send you back home saying for once in your life that you got more than your money's worth. We not only want you, but Sewell, Stahmer, Schilling and all of these who try and picture poultry in a sentimental way. I have noted your pictures. They all carry with them sentiment and I know that you are not near so sordid as you would try to make the world think. I know you would look after the dollars and cents to a certain extent, but I know if you saw a picture, that fact that the paints and canvas cost money would not be a detriment and that if you could grasp the situation and I know that you can, you would paint the scene even if you were out of pocket in so doing.

Now forget dollars for a few minutes. Give your whole time from this on to boosting San Francisco. Come forth with some of those good birds you are breeding. Teach us Pacific Coast breeders just what a good bird consists of. Help to build up your country and do not bound the American Poultry Association by any limit. If it becomes necessary, I will vote to hold a convention in Honolulu if I thought it would build up the industry of that territory. Come to San Francisco. Come by the Northern route. Come and stop at Spokane, Seattle, Walla Walla, Olympia and Tacoma, Washington, on your way out. Just come and see this city. A city that was a forest less than thirty years ago. Come and see our big trees, our bigger lumber mills, our beautiful waterways, natural parks and the things that men have done in so short a time. Come and see the poultry that we have bred from the "seed" that we bought in the "East." We, unlike you, must see the east, for we think our education lacking unless we have been in all the states of this great American continent. We, many of us, have seen Alaska, and some of us have seen far away China, Japan and a lot have emigrated from Europe in order to come and live on Puget Sound and the Pacific Coast. Sentiment brought many of us, but the fact that many of us thought we could better our condition made us stop off on the Puget Sound Basin.

Come to a country where you can be within three hours of a natural glazier as you can at Tacoma. Come where you can ride in an auto from daylight to nightfall from tidewater to an elevation of nearly fifteen thousand feet. Show me a place around Vineland where you can have so much for your money.

With a whole lot of sentiment and a whole lot of sordid feelings, I invite you to come West and do not forget that if you want to make a profit (this is where sordid comes in) bring with you some good fowls. Some that will beat the ones we have on the Pacific Coast and we will show you that our sordid feelings and our sentiment goes double. We love the beautiful and there are just sordid enough to pay gold for it, if we can not get what we want in any other way.

You can reduce the percentage of mortality to a minimum if you start your chicks on

WHITE RUNNER DUCKS

RUNNER farming is fast coming to be a big and important branch of the poultry industry.

The great trouble in years past has been a lack of sufficient knowledge of the business to make it a profitable investment.

It is reasonably safe to predict that when the people come to know the real Runner more thoroughly and the delayed interest in Runner keeping begins to move it will come with something of a rush, and those who are ready for it with real Runners will find business good.

By real Runners, I mean birds that have a "soda water bottle shape" upright carriage, that walk instead of waddling like Pekins or other breeds of ducks. Their heads should be small and well formed, with eyes set near the top of the head. Their bill a clear yellow or lemon color and the shanks and feet bright orange color.

Unlike the slow, waddling duck, it is swift, active and alert, the formation of the body being conducive to the highest prolificacy and its elevation and balance allowing perfect freedom of movement enabling the birds to run and move at a great pace.

It is the liberty of action which gives the "Running" type such an advantage and places it supreme over all others. With its keen hunting instinct and unrivaled speed it can forage thoroughly in a given time, a much greater area and far beyond the limit possible to any other domesticated duck or fowl.

A flock of real Runners present a beautiful appearance.

The first thing for successful Runner growing is carefully selected stock for parent birds, selection of the best for years have produced the most improved and profitable breeds of stock. The future stock depends very much upon the parent birds or their ancestry. Repeated breeding from inferior birds makes inferiority hereditary.

After having faithfully tried the Fawn and White and Penciled and the White, I prefer the White Runners for several reasons, but they all have their good points.

They have proven hardier than the Fawns and Penciled, more gentle and will always come home at night, and more easliy handled, and with proper care are ready for market several days sooner than the other varieties.

When dressed for market White Runners make a better apearance as there are no colored pin feathers to show, and they have a flavor all their own that would suit any epicure, and as egg producers have no equal and I beleve they are less liable to disease of any kind. If ducks are young (late hatched) they require more food as they are still growing and are immature; if ducks are old they should have more green feed, where it can be grown and less carbonaceous food in later part of season.

Breeding fowls should not be overfat as the offspring of such fowls are less vigorous.

Too much corn will produce overfat ducks unless they have abundant exercise in insect-hunting, and plenty of green food.

Laying season for May hatched ducks usually begins the first part of October.

It is natural for Runners to hide their nest if given free range. Petting will do much toward keeping them near the house. If birds are kept yarded and nests provided very few, if any, eggs will be found on the ground or in the litter in the house.

Ducks lay early in the morning and eggs for hatching should be gathered as soon as possible and kept in a cool dark room, and if not used at once they should be turned occasionally to prevent adhering to the shell. My advice to beginners is to buy the best they can get, either eggs or stock from a good reliable breeders.

In conclusion I should like to say to those who are already breeding this variety, tighten up your belts and go to it stronger than ever. Get out this year with a show string and show the people what really good White Runners look like. Begin your preparation for this showing right now and stay right on the job until the judge comes down the aisle.

To those who do not breed this variety I will say now is the time to commence. If you are making a reasonable success with some other breed or variety try out the White Runners and I believe you will attain greater success. Should it happen that your poultry experience hasn't proved profitable, don't fail to give this variety a fair trial. It will in many cases turn the worst failure into an assured success. Some poultrymen who have had the most dismal failures have discarded their own breeds and keep nothing but White Runners and are now building up a successful business with a most successful career. You can do likewise.

NOTE—Mr. E. G. Curtis, Atsion, N. J., is leading breeder and exhibitor of White Runner Ducks whose birds have won at our best shows. We consider him an authority on the Duck question, safe to follow. H. P. S.

NIEMAN'S POULTRY FARM

H. A. Nieman & Co., Ransomville, N. Y.

will be held November 2 to 6th inclusive, will be the official A. P. A. show of the state and the Gold Medal awarded each year by the A. P. A. will be contested for by exhibitors at Chattanooga, which should be the means of doubling the number of entries for 1915 over the 1914 show.

Chattanooga has always been recognized as having one of the best Poultry exhibits in the country and this record coupled with the honor of the opportunity of awarding the A. P. A. Gold Medal is self evident that Chattanooga is moving forward each year into National prominence.

The officers of the association are: O. B. Andrews, Pres.; D. S. Henry, 1st Vice Pres.; T. M. Marrett, 2nd Vice Pres.; F. C. Rose, Sec'y Treas.; Wde H. Farrar, Ass't Sec'y.

Breeders both large and small are urged to arrange their plans for the coming show season so they can exhibit at Chattanooga in November, 1915.

The show will be a comparison show, open to the world. Catalogue and premium lists will be ready for mailing by September 15th, requests for same should be mailed the Secretary, P. O. Box, 103b Station A., Chattanooga, Tenn.

AGENTS WANTED

We desire to have a reliable person to act as agent for "Everybodys" in every town and hamlet in the U. S. and Canada. Here is your chance. We pay CASH COMMISSION. Write for terms.

"EVERYBODYS POPULARITY"

I want to congratulate you on issuing the best poultry paper I have seen this month. Your paper s more of a book than it is a monthly journal. I am especially fond of that front cover—the best new thing I have seen. How are you going to run such a magazine and get out on the road? Are you going to do three men's work?

Yours very truly,
FRANK L. PLATT, Swanton, O.

* * *

I like Everybodys Poultry Magazine. That magazine sounds a little hifaluting, but as the negro would say, "We all get proud once in a while." I like "Everybodys," because it is full of sentiment. Schwab, Cleveland, Lewis, Graham, Mrs. Rice, Martin, Wolseiffer and other sentimental fellows, have made pure bred poultry the household talk of the world.

Hoping that your sentiment will be crowned with the success you deserve, I remain,

Yours very truly,
HARRY H. COLLIER, Tacoma, Wash.

* * *

I have received and read three copies of your Everybodys Poultry Magazine. If you can keep the pace you will certainly draw a desirable subscription list.

Yours very truly,
T. F. McGREW, Scranton, Pa.

* * *

Have just had a chance to go through "Everybodys." I want to congratulate you on the splendid big number that you have put out. It shows a lot of hard work on the part of you and your associates and you have done well in getting the machinery assembled so well. I know that it requires a great deal of work to do what you have succeeded in doing and believe that you cannot feel other than gratified at having accomplished so much.

With all good wishes for you and everybody connected with "Everybodys," I am,

Very truly yours,
W. C. DENNY, Buffalo, N. Y.

* * *

We give below copy for change of ad. for May issue of your magazine. We were very much pleased with the first issue of your magazine but, at the same time expected it, as we considered the men at the head of the venture very capable, and the men that are to furnish articles as good as to be had, and with this combination we do not see why "Everybodys" should not prosper and be a leader in the poultry literature.

Wishing you the greatest success, we are,

Yours truly,
BALCH AND BROWN, Manchester Conn.

* * *

The first number of Everybodys Poultry Magazine was received and read with great interest. It is indeed a high class journel and as there is always room at the top, have every reason to believe that your journal will meet with the success it so justly deserves.

Sincerely yours,
S. T. CAMPBELL, Mansfield, Ohio.

* * *

I wish to congratulate you on your magazine. "Everybodys" is indeed just what its name says. I wish you every possible success in the future and will give it a boost whenever possible. Yours,
E. G. CURTIS, Atsion, N. J.

* * *

I wish to congratulate you upon the splendid showing made in your first issue, which is a credit to all in any way connected with your paper. Very truly yours,
M. R. JACOBUS, Ridgefield, N. J.

* * *

I have my copy of the April number and it is certainly great. The whole appearance of the paper is good and I know you can keep it up to this standard.

Yours sincerely,
JOHN S. MARTIN, Port Dover, Ont.

* * *

Congratulations on your first paper. It certainly is fine.

Very truly yours,
FOXHURST FARM,
per R. N. Barnum,
Time Rock, Conn.

* * *

I hope you make a big success of "Everybodys;" the two copies I have seen are dandies. Inclosed find an advertisement from me, just to show you that my heart is in the right place. With best wishes, I am,

Yours truly,
WM. A. HENDRICKSON, Milton, Mass.

* * *

Your effort meets with my approval. It is a clean cut, interesting copy from start to finish and I sincerely congratulate you and your co-workers.

My hope for you is the full satisfaction of all that you hope for yourself. I shall be an interested reader and a true friend as long as we are in the game. I know some of the trials you will have in making good, but remembr, this is your work and don't let go until you have left your mark on a successful pournal. Sincerely yours,
L. D. HOWELL, Minrola, N. Y.

* * *

I think that the general idea of quality of your magazine up to the present time is in a superior atmosphere and it appears to me to be a particularly well published journal and I hope you will reap success in every way.

Very truly yours,
HOMESTEAD CAMPINE FARMS,
C. A. Phipps, Wayland, Mass.

* * *

Permit me to tell you of the pleasure and instruction I have received in reading several articles in April "Everybodys." I have just returned from the Northwest and have not as yet had an opportunity to read the May issue.

Trusting you will be entirely successful in your new field, I am,

Very truly yours,
FRANK E. HERING, South Bend, Ind.

* * *

May your good paper always be as good as the first copy and with hopes that you make out of it the success which you desire,

Yours very truly,
ALEX N. WARNER, Titusville, Pa.

* * *

Beg to advise you that as everybody seems to be advertising in "Everybodys" and since we would rather be somebody than nobody when our contracts expire this coming fall we wil take this matter up with you.

Very truly yours,
H. B. HARK,
Sheffield Farms, Glendale, O.

* * *

Hearty congratulations on the appearance of your first issue. You have put out a Poultry Magazine equal to any published today and with your push and perseverance it bound to be the best.

H. D. RILEY, Strafford, Pa.

* * *

"Everybodys" is at hand and it is all that can be desired. Keep it up. There is great possibilities, Yours vary truly,
WM. ANDERSON, Saratoga Springs, N. Y.

* * *

We admitted "Everybodys" and all in it. Your articles are exceptionally good. Every success to you. Very truly,

FAILURE AND SUCCESS

(By Mrs. Hattie Hull)

I WAS raised on a farm and was a lover of poultry, and I believe one must love the work they are engaged in to make a success. When I was a little girl I was always ready to assist mother in the care of her poultry, but in those days incubators were not heard tell of, so we had many discouraging experiences. I well remember of a Sunday when the family would go to church, mother would stay at home to watch the old setting hens. Very different nowadays; the entire family can go and feel that all is going well if you have an incubator setting. I believe the worst experience we ever had mother sent off and got six settings of eggs, paying a fancy price for them, and to be more sure of good results we set the six hens in a little room to themselves. All went fairly well, only an egg broken once in a while; of course, that all goes in when we set hens, until just the day before they were to hatch when they got in a scrap among themselves, and when we went in the room what a sickening sight met our eyes. The hens were nearly scared to death and dead chickens, broken eggs and feathers were all over the nests and floor. Only three chickens were hatched out of the six settings and two of the hens had to be sent to the hospital for treatment. No such trouble as that with an incubator.

Well, that was thirty years ago. After I married and tried to raise poultry for myself I had a great loss from lice; more trouble with that than anything else. I have really had my little chickens covered with lice before they were taken out of the nest, but six years ago I learned the secret to do away with them, and that was by using an Old Trusty Incubator. I got my incubator second hand. One of my neighbors had two Old Trustys, 150 egg, redwood covered, and the other was 200 egg, metal covered, and as she was moving away she wanted me to buy one of them. As she offered me the old one cheaper I took it. I thought it would do to try my luck on. I set it the first time in March, just taking the eggs as they were gathered for market. I didn't test the eggs out so don't know how many were infertile, but from 150 eggs I hatched 116 chickens.

From that hatch alone I paid for the eggs I set, for the oil used, and the incubator and brooder with the roosters which I sold, and had a nice flock of pullets left. I have set it from two to three times every year since and have always had a good hatch. This year I started the incubator on the 28th of February and from 137 fertile eggs got 124 chickens, all Buff Rocks, and they are sure dandies. It has been very bad weather on the little chicks ever since they were hatched, as it has been cold and scarcely no sunshine, but have lost very few of them. Of course, my incubator looks rather old fashioned now, as it was patented in 1903, but it does the work just the same.

So one may see that the Old Trusty is by no means a short lived machine, and they are so little trouble that it don't even require one that can read to run them, for the instructions are so simple that if onee heard can never be forgotten. By the way, I want to add that I loaned my incubator to two of my neighbors and they had such good hatches that it was the means of both of them buying a Trusty.

There are so many reasons that an incubator is far better than hens. We can set them when we please and our hatch is free of lice, and while our machine is setting our hens are laying, and many others that I could mention. In conclusion, let me say that I live in a small town so am not fixed for the poultry business as I would like to be, but have been very well pleased with my success, and my husband says if I can do what I have with no more conveniences than I have had, surely I could do better in the country where there is free range for chickens, we are almost in the notion of going to the country another year and try poultry raising on a little larger scale.

Copyrighted 1915, by Everybodys Poultry Magazine Publishing Company, Hanover, Pa.

1896 **WHITE WYANDOTTES---Mountain Strain** 1915

WINNERS AT NEW YORK FOR 12 SUCCESSIVE YEARS

The strain that gave the type for the 1915 Standard years in advance. The type which combines beauty and utility in the highest degree. Matured young stock for August and September shows. No competition too keen.

All breeders tested and certified free from white diarrhea bythe State Agricultural College.

WEST MOUNTAIN POULTRY YARDS, F. B. Williams, Prop. **Box B** **NAUGATUCK, CONN.**

Single Comb Rhode Island Reds

TESTED, TRIED AND TRUE WINNERS

At the great Baltimore 1914 show of 19 birds entered, 17 were placed and won special for best display. Also winners at Philadelphia and Hagerstown. 1915 matings cannot help but produce a large percentage of prize winners. Eggs, $2, $3 and $5 per setting. Large lots a matter of correspondence. Stock for sale at reasonable prices. Fertility and satisfaction guaranteed.

GEO. W. WHITE, -:- **HAMILTON, MD.**

ATTENTION

Cornish Champions and Breeders For Sale at Sacrifice Figures

To Make Room For Young Stock

My birds were leading winners at the last "American Cornish Club Shows" also N. Y. State Fair, Phila., Balto., Williamsport, Pa. (Penna. Club Show), Richmond, Va. (Va. Club Show), Hagerstown, Va., State Fair, Norfolk, etc., etc. Look up my winnings the past three seasons and be convinced that "Jaqualin Farm" produces the best.

Customers are winning North, South, East and West with birds of my strain.

JAQUALIN FARMS

BOX 751 WARRENTON, VA.

Courtland H. Smith, (Pres. American Cornish Club) Proprietor

Banks' Egg Record and Account Book

The simplest and most convenient system ever devised for keeping an accurate record of eggs laid; record of hatches, income and expense account, etc. This book is conceded to be the best on the market. Now is your time to get one to keep your season's record complete. You always know where you are at. The truth of the matter is you can't get along without one.

Size of book 7½ x11, printed on the best paper that will not blot, with beautiful cover ; enough pages for one year's work.

Shorewood Peerless Vegetable and Flower Garden

Ten Choice Vegetables

Beet, Carrot, Cabbage, Cucumber, Lettuce, Onion, Radish, Parsnip, Tomato, Turnip.

Six Standard Flower Seeds

Aster, Balsam, Cosmos, Nasturtium, Phlox, Sweet Pea.

16 Large Packets 26c

In this collection we use the John Baer Tomato. It sold last season for $1.00 per Pkt. This collection is worth $2.00—you buy it for 26c and you get full cultural directions for vegetable and flower growing, worth in itself more than we ask for the seeds. **Very special.** A copy of "Good Poultry" (10c), our quarterly magazine; also a copy of "Intensive Farming," a valuable book for poultrymen, vegetable and flower growers, fruit growers, etc., all included in this wonderful offer.

If you want an extra Pkt. of John Baer Tomato, add 25c to this collection price. If you want an extra Pkt. of any other vegetable or flower seed named in this grand offer, add 5c per Pkt.—one-half regular price. This is the greatest offer we have ever made to the farmer's wife or the back yard gardener. Everything just as good as can be. If not entirely satisfactory, money refunded upon return of collection at our expense, without argument. This offer is made to introduce Shorewood Seeds to you. Good as long as stock holds out. Write tonight.

BUILD IT YOURSELF
FROM OUR SIMPLE
BLUE PRINT PLANS

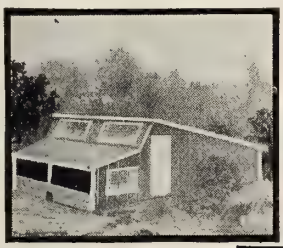
The "DIAPHRAGM"

Automatic Fresh-Air Suction Poultry House is one of the greatest discoveries ever made in the construction of poultry houses. Embodying all the best features of other houses, it also offers something entirely new in having a roosting compartment into which fresh air is forced automatically by the fowls themselves. No matter how many fowls are on the roosts the air will at all times be absolutely pure, thus preventing disease. It is a well known fact that nearly all the different diseases develop during the cold and damp nights, while the fowls are sitting still on the roosts, because sitting directly above the dung they breathe the germ-laden air over and over again, especially where there is a drop curtain in front of roosts. One of the best features which we claim for our house is that **double the number of fowls can be kept in a house equipped with a "DIAPHRAGM"** than are usually kept in a house of equal size, for the greater the number of fowls on the roost, the greater will be volume of fresh air rushing in and expelling the foul odors.

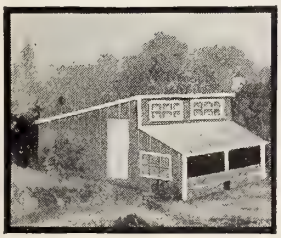
Designed by Louis A. Stahmer

Equip Your Old Poultry House with a "DIAPHRAGM" —It Costs But Litlle to Build

Complete specifications accompany each plan. All measurements are in plain figures, no technical architectural terms used. If you can handle hammer and saw you can build any one of these open air poultry houses from our plans.



Dr. Woods' Open-Air House with Diaphragm Roosting Compartment



THE DIAPHRAGM HOUSE

Plan No. 2 gives complete specifications and meeasurements to build this 8 ft. by 16 ft. model No. 1 or 8 ft. by 12 ft. model No. 2 house. The most scientifically built poultry house.

DIAPHRAGM HOUSE
Model No. 2

WOODS' OPEN-AIR HOUSE

with diaphragm roosting compartments. Plan No. 3 gives complete information to build this most popular house. Thousands of them in use all over the country. Size: 8 ft. by 16 ft.

Anybody Can Build from Our Simple Blue Print Plans

PLAN No. 1 will enable you to build an 8′ by 20′ diaphragm house or one section of a continuous house. It also shows drawings for model No. 2, 8′ by 13½′ building.

PLAN No. 2 shows the drawings for an 8′ by 16′ diaphragm house or one section of a continuous house. It also shows drawing for an 8′ by 12′ model No. 2 house.

PLAN No. 3 gives complete information to build an 8′ by 16′ Woods' open air house with diaphragm roosting compartment or for one section of a continuous house.

All these houses have been endorsed by America's foremost fanciers and have given universal satisfaction under all conditions. These plans are for sale at our office and we will send any one of the above complete plans and specifications for $1.00 or with subscription to the

WHITE RUNNERS. PRIZE WINNERS. Two Dollars each. Bruce Sentz, York Springs, Pa. (83)

EGGS FOR HATCHING

MORE BREEDERS HAVE FOUND THE way to poultry success by buying hatching eggs than in any other way, it is the short and reliable way to better poultry. Everybodys shows the way to success.

EGGS FOR HATCHING—ARE SOLD BY the thousands each year. You too can dispose of many if you will but tell prospective purchasers that you have them to sell. One of these little ads will do the trick.

HATCHING EGGS—BARRED ROCKS, both matings R. C. Reds, White Wyandottes. Best show stock, $3 per 13; best utility stock, $1.50 per 13, from profitable layers. J. Zacharias, Verona, Pa. 98

FAVEROLLES

AMERICAN WHITE FAVEROLLE CLUB —Mr. Geo. Hole, Sec'y., Cornwall, N. Y.

AMERICAN NATIONAL SALMON FAVerolle Club—Mr. W. W. Hall, Sec'y., No. 1067 Westminster Street, Providence, R. I.

LINK ENDORSED THE FAVEROLLES, He also was one of the first to send in an ad to Everybodys. Follow Link for a winner.

WHITE FAVEROLLES—WE HAVE THE largest flock in America of these wonderful meat and egg producers. More blue ribbon winners than any other American breeder. Young and old stock for sale. Dictograph Poultry Farm, West Nyack, N. Y. (85)

GEESE

GEESE SHOULD HAVE FRIENDS AND promoters enough for a good strong club. Let someone issue a call for a meeting at one of the big shows and let's have a Goose Club by all means.

THE SHORT ROAD TO SUCCESS IS through the advertising field. Try Everybodys first for assured results and complete satisfaction.

GUINEAS

GUINEAS ARE ONE OF THE BEST things on the farm. Everybodys is one of the best things to have in every home.

HAMBURGS

AMERICAN S. S. HAMBURG CLUB— Mr. W. S. Binkley, Sec'y., Clay Center, Kans.

HAMBURGS, THEIR HISTORY AND Breeding is told in books we sell. Let us know your wants and quote you prices on Poultry or Farm Books, Magazines, etc. we can save you money. Surely include Everybodys in your list.

HAMBURGS—POULTRY'S DAINTIEST Creation. The demand exceeds the supply. Acquaint the buyers with your stock through the medium of Everybodys business getting classified ads.

HOUDANS

AMERICAN HOUDAN CLUB—MR. JOHN Gough, Sec'y., New Haven, Conn.

CAN THE HOUDAN WITH ITS FIVE toes scratch over more litter than any of the four toed varieties. Everybodys covers the field of all varieties. Houdans will always be well represented in its reading columns.

JAVA

AMERICAN JAVA ASSOCIATION—MR. S. W. Morton, Sec'y., Albany, N. Y.

BLACK JAVAS

THE NATIONAL JAVA CLUB—MR. Herbert J. Link, Sec'y., LaPort, Ind.

MONEY IN POULTRY DEPENDS GREATLY UPON YOUR ABILITY TO SELL RIGHT AND PROMPTLY. EVERYBODYS IS AT YOUR SERVICE. WE WILL AID YOU AS BEST WE CAN. FEEL FREE TO WRITE US AT ANY TIME AND UPON ANY SUBJECT. YOUR WANTS WILL HAVE OUR BEST CONSIDERATION ALWAYS.

CONSTANTLY ASCENDING IN THE Scale of public appreciation is the position secured by Everybodys classified advertisements. They bring results.

LEGHORNS

AMERICAN LEGHORN CLUB—MR. N. L. Kisling, Sec'y., Bel Air, Md.

LEGHORNS—THEIR CHAMPIONS PROclaim them the greatest of egg machines and well they may, but unsold eggs rot. One of these little ads will surely unload for you.

Vol. XX. HANOVER, PA., AUGUST, 1915 No. 8

CULLING THE YEARLINGS

The Value of Rigid Selection Should Never Be Under-Estimated.--By Prof. H. R. Lewis.

THE possibility of improving egg production through continuous selection, and the possibility of improving poultry with reference to all desirable characteristics by this means is great. All branches of live stock have been improved and developed largely through the intelligent exercise of the breeder's power of selection. No other line of breeding work offers greater possibilities from this source than poultry keeping. When breeding from an entire flock of birds, with no regard to selection, the off-springs will be no better than their parents. One is impressed and gratified by the improvement which can be secured by selecting and breeding from a few of the best individuals rather than from the entire mass. This method of selective breeding results in two definite improvements.

1. Increasingly higher egg production will be secured from certain individuals, and by continuously selecting these individuals which produce heavily, it is possible to attain higher and higher averages. 2. Continued improvement in egg production can be brought about through the elimination of individuals producing a small number of eggs, and the substitution in their places of birds laying larger amounts. Selection is not only fundamental in increasing egg production, but it is just as important in its effect on color pattern, body shape, and in the characteristics which denote vigor. To the poultry keeper working for any purpose, the breeding of better birds each year should be one of the most important lines of work planned. It is of equal importance with proper housing and feeding, for one without the other availeth little. From the standpoint of profit, the cutting down of expenses, by selecting the more profitable hens, and disposing of the unprofitable ones, a considerable saving can be secured in the feed bill. More birds can be kept, which are capable of producing profitably. Summer and early fall is doubtless the best season for practicing this definite selection. It is the best time of the year, because the poultryman has more time at his disposal, and can therefore, give the work closer attention.

It is the season of the year which follows closely after the birds have exerted the most severe strain upon their vigor and stamina. The late winter and spring production followed immediately by the hot weather of summer, decrease the vitality in all birds, and weaker ones show very quickly the effect of this strain. August and September is the time when these weak birds, which are not suitable for breeding or for laying, can be early detected and by an examination of their physical conditions. This season is an especially desirable time for selection and culling, because it is just prior to a season of low production, and a good time to get rid of undesirable birds, which if kept, would be held over at a loss. At this time of the year there are two definite selections to be made. 1. The culling out of the yearlings, keeping the best for breeding next year, and secondly the culling of the pullets, as they come off the range.

SELECTING CHOICE BREEDERS

The rearing of a good number of chicks next spring will be determined in large part by the care and attention which is given the breeding stock. The hatching and raising of chicks is the most difficult process of poultry management. There is nothing that will insure a good hatch more than vigor and stamina in the parents. When making selection of the yearling hens, the best practice is to go through the entire flock, picking out relatively small proportions of those which at a glance, show by their type, size and vigor that they are physically superior to the other individuals. When making this selection, characteristics for vigor and stamina, later discussed, should be considered carefully. When selecting these few, choice breeders, if a white egg breed, be sure that they lay a white chalky egg, thus tending to unify future flocks in this respect. It is a fact that the use of some birds, which lay tinted eggs, will result in a larger number of such eggs next season. These breeders which are especially selected, should be kept under range conditions, and not forced for production.

Perfect health and surplus of vitality next spring is the purpose. In other words, egg production for market should be discouraged during the fall and winter, and the birds should be induced to take plenty of exercise, thus becoming hardy and healthy by living an out-door life.

CHOOSING THE PROFITABLE LAYERS

After picking out a few of the better birds for a choice breeding flock, the yearlings which have just completed their first year's production, should be gone over carefully with a view of saving from one third to one half of them as layers during their second season. It is usually a good practice to maintain a poultry flock, one-third of which are yearling, or two-year-old hens, and the balance pullets. That is, on the farm wintering 1,500 birds, 1,000 would be pullets and 500 yearlings. This would enable the culling and disposing of one-half of the pullets at the end of their first laying season, which would necessitate the producing of 1,000 additional pullets to main-

Rose Comb Rhode Island Reds have made unusual advancement in color and shape and their gain in popular favor is noteworthy. Here is shown a beautiful study by Artist Schilling of a pen and flock of the well known Bushman-Pierce Strain, of Hope, Ind. This line includes both Single and Rose Comb Reds. We have seen them exhibited at several shows and noted their extraordinary form and sound, brilliant color.—H. P. S.

tain the desired average. If trap nests have been employed, the question of selecting the best layers and the most desirable birds is not difficult, because all such birds, which have made good records can be passed. Many possessing serious defects or any characteristics which shall tend to lower future performance, could be disposed of. On the other hand, very few poultry farms can afford to trap nest all their pullets. In these cases the selection must be made on external indications of vigor and stamina. Investigations and practice with poultry show very clearly that there is a very close relation between inherent vigor and the ability to produce eggs. It is certainly true that the lack of vigor and vitality in an individual, even though it posseses a physiological organization for egg production, will result in few eggs being laid, owing to the lack of their ability to maintain themselves in a healthy condition, and to utilize sufficient nourishment. When culling the yearlings, the following factors should be considered:

A sturdy S. C. White Leghorn male possessing wonderful possibilities as a breeder. Note especially the short deep head, stout beak and prominent eye. The full breast and long back, together with the rather low hanging tail make him a progenitor of progeny which are not only possessed of much vigor and stamina, but which conform very closely to standard shape as well. This male has been the sire of many high producing daughters and represents a type which is desirable to mate to a few specially selected females for breeding.

INHERENT VIGOR, ABDOMINAL CAPACITY, SIZE AND HEALTH.

Inherent vigor, abdominal capacity, size and health, and in addition to these, if the birds are to be used at all for breeding, the question of color and plumage, and body conformation required for that breed, should be given due consideration. When selecting for vigor, it has been found by careful observation that the following characteristics are desired. The vigorous bird is active, bright, and an extensive forager. They search vigorously for feed, not giving up until the last kernel is found. They are off the perch early in the morning, and among the last to return at night. In reference to body conformation, they have a relatively short thick neck, short stout beak, deep broad head, moderately long legs, with heavy bones, and a body of a vigorous bird is always rather deep and wide, and moderately long. The low vitality bird has the reverse of these characters, especially the slender body, long legs with stilted appearance, a long neck and a thin, narrow head. The strong bird at any age should have a bright eye, prominent and well colored plumage, with bright comb and wattles.

Birds which show pronounced signs of vigor at an early age, have usually inherited this characteristic, if their environmental conditions have been properly provided. Older birds, in which the lack of vigor has gradually developed, may have had this condition caused by a number of possible conditions. An increased egg production due to forced feeding will frequently be accompanied by its proportionate lack of vigor. Too close inbreeding without due regard for vitality, is another common cause of depleted vitality. The use of pullets instead of hens will result in smaller individuals, and a lowering of the inherent stamina of future generations. The feeding of concentrated foods, with a view of increased production will cause many birds to go off their feed, resulting in the loss of many superior characteristics, which they might possess. Excessive crowding of the breeding stock will lower vitality. Lack of exercise in the management of many flocks of birds will cause an over-fat condition, which will be followed by a subsequent lowering of the inherent vigor. The poultryman can guard against most of these possible causes of loss of vigor, and thus insure a greater abundance of this most desirable quality. When culling the yearlings this question should come first, for without it no amount of other characteristics will be of any avail.

ABDOMINAL CAPACITY IMPORTANT

A bird with a moderately large body, aspecially wide and deep, shows that she has capacity for the proper development of reproductive organs. Without room for development, any bird can not consume and assimilate the large quantity of food material, which it is necessary to untilize in the production of eggs. An average hen laying around twelve dozen eggs a year, will consume between thirty and forty times her own weight of food material, in order to produce eggs, weighing about nine

A yearling White Leghorn hen showing a type which should be selected in the fall and kept over for breeding purposes. This hen laid 210 eggs during her first year's production with no effort at forcing. Her strong yet delicate head, well developed body and sturdy shank are the primary characteristics which should guide one in making such a special selection.

Half-tone made from unre-touched photographs of the Second Prize Exhibition Pen of Barred Plymouth Rocks at Coliseum Chicago Show, December 11th to 16th, 1914. Bred and owned by D. F. Palmer & Son, Yorkville, Ill. (Ed. Note—Messrs. D. F. Palmer & Son have been breeding winning Barred Rocks for upwards of 20 years and their line is favorably known in all sections of this country. Mr. Palmer has been prominent in club work and is an enthusiastic fancier and breeder, whom we are pleased to recommend.

times her own body weight. This means that she must have a wonderful organization for digestion and assimilation. There is doubtless no animal on the farm which consumes more food in proportion to her own live weight, than the hen. The ovaries and oviduct lie in the abdominal part of the body, and during the heavy laying will be much enlarged. Hence this body characteristic is an indication of room for proper development of the vital organs.

GOOD SIZED BIRDS ARE BEST

It should be the aim, when culling the yearlings, to eliminate under-sized birds, as well as excessively large ones. The birds of moderate size are generally superior.

A Rhode Island Red Hen possessing at the end of her yearling year the body characteristics and signs of vigor which this hen, No. 932, shows, can well be kept over for breeding or laying one or possibly two more seasons. A few hens of this type specially selected and carefully mated will do more in one year towards improving the quality of the flock than will years of hit or miss breeding.

Such birds laying large eggs, have the capacity for greater egg production, and in addition to this, after they have passed their usefulness for egg production, they will bring greater revenue when sold for market purposes.

SICK OR DISEASED BIRDS SHOULD BE DISPOSED OF

It should be made a rigid rule that no birds, which have been sick, or which have ever been subject to roup, chicken pox, or canker, should be kept over for the second year. Such birds, even though partially recovered from the infection rarely make profitable birds, and in addition to this there is always the danger of their carrying the infection, and spreading it next winter. Birds which are ever seen to show signs of sickness should be conspicuously banded with a red band, and then when it comes time for selection, such birds can be immediately disposed of, thus avoiding the danger of their spreading the trouble. Birds which have ever shown signs of diarrhea or enterites, or which have been partly affected with scaly leg mites, are also found to be a menace to the flock in the future. Birds which have always been healthy, possess a natural quality of vigor and life, which makes them desirable for propagating purposes. Birds which lack this quality, more easily contract diseases, and hence should be disposed of systematically.

SELECT FOR STANDARD SHAPE AND COLOR

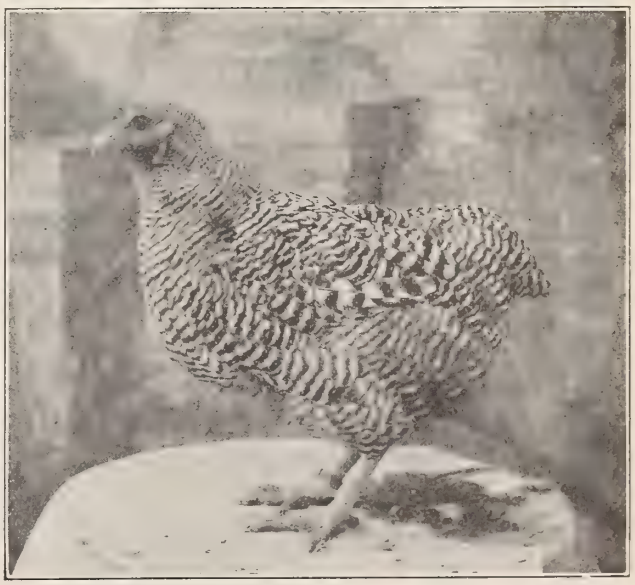
While the utility qualities of vigor, egg production, and health are paramount, yet the poultryman would not be performing his duty to himself and to the poultry industry if he did not pay due attention to the characters of plumage pattern and body conformation. Pure breeds are superior to the mongrel, because there is a greater possibility for disposing of the eggs and stock for hatching and breeding purposes. While it is not necessary to go to the extreme, and save only birds which possess certain plumage, regardless of their productive ability, yet it is desirable to combine in the same individual high egg production, together with the plumage pattern required for that particular breed, and a body shape which is not antagonistic to the standard requirements with that breed or variety. The so-called utility bird which we have heard so much about lately, if in its make-up standard qualities of type and color are neglected, has no future. The term utility has frequently been misused, it having been applied to any flock of birds regardless of their production, if they were of such type and color that they would not pass as good specimens of the breed, which they were supposed to represent. A poultryman purchasing utility birds, so-called, should insist upon a record of their performance accompanying their sale, otherwise he is apt to be greatly disappointed in the result attendant upon their use. It is perfectly possible to secure an exceptionally large egg production from birds which are nearly perfect in regard to their color and shape. In fact it is just as easy to breed egg laying qualities into birds of this type, and if an effort is continually made along this line, the squirrel tailed specimen and those with the other common defects can be eliminated, and their places filled by birds of standard conformation.

CULLING OUT THE UNDESIRABLE PULLETS

The fall is the season of the year when all poultry keepers will bring in their pullets, and place them in winter quarters. As a general rule, it is best to discard at least ten per cent. of pullets brought in. There are always a few which will be slow in development, undersized and some physically deformed. This is an indication in itself that such birds will not make profitable producers, but will act as star boarders during the winter. Pullets with short narrow beaks, shallow breasts and those with long necks and weak knees should be disposed of at this time. This systematic culling of pullets each year will result in geater egg production, and a much more profitable production. The plumage of the pullet should be strong in color, naturally glossy, showing health and strength. Their color should be consistent with the breed requirements, and its general appearance should denote activity, life and vigor. Systematic selection especially in the breeding flock, can best result in definite improvement by following closely the matter herein described.

METHOD OF BREEDING FOR EGG PRODUCTION

Trap nests are necessary for the definite development of the egg-laying strain. A few of the finest pullets should be selected for trap nesting. Only a few of the best should be used, as trap nesting is painstaking, and



Barred Rock Hen No. 3963, as she appeared at the end of her 2nd year's production. This picture, taken late in September, shows her to be a late moulter, which characteristic is usually common with heavy laying hens. Her long body and vigorous head points together with a good plumage pattern put her in a class of desirable producers.

to be of any value must be accurate. In picking out these birds select only those of good type and color and of perfect development. This flock should be kept under normal laying conditions, and the trap nests visited fre-

quently and regularly. The egg production in winter of these pullets if trap nests are operated from September to April, will be a good indication of their total yearly production. It has been found by Dr. Pearl, of Maine, that the winter egg production of individual hens can be taken as a criterion of yearly production. The heavy producing birds in this flock can then be separated the following summer, and put on an extended range and cared for the following year as breeding flock. To them should be mated a male bird, which is known to come from a female which has produced a large number of eggs. Cockerels which have been hatched from some of these high producing hens during the second year, if bred back to their mother for one generation will result in intensifying this high producing ability materially. A few years of this inbreeding, if healthy, vigorous birds are used, will do much to increase fecundity, not only in a few of the high records, but on the other hand will result in great improvement in the average production of pullets reared. The keeping of small trap nested breeding pens of this kind involves a little additional labor, but its results in increased production and profit are always unmeasureable.

Selection should be practiced by every poultryman, because it paves the way for a more economical and profitable production, which is the foundation of all breeding, and is by far the cheapest method of improvement. The culling out and disposing of inferior birds, and the breeding from only a few of the best, are the two fundamental factors in the application of the powers of selection to the management of the large or small poultry flock.

THE POSSIBILITIES IN POULTRY BREEDING

The Opinion of Some Prominent Breeders Regarding the Future of the Poultry Business. We Want More Articles Along This Line.--Editor.

By U. R. Fishel, Hope, Ind.

AFTER thirty odd years of experience in the poultry business it seems to the writer that there is nothing impossible in the poultry business unless it is failure. The fancy or commercial poultry business has withstood the panics and general business depressions better far better than any other branch of business, especially any branch of live stock business. It has been said that the season just passed has been a very bad one for the poultry business, with all this the price of market poultry and eggs has never been higher and the demand for the very best in all breeds and varieties has been as great as ever.

The prospects for the future has never been as bright as at the present time. The poultry business for the next ten years is going to be the best ever known and the demand for thoroughbred fowls is going to be so great the breeders of the popular varieties will be unable to supply the demand.

Never in my thirty odd years experience in the poultry business has the time been so good to take up the poultry business as at the present time. Those that start in the poultry business now will reap the harvest of 1916 to 1915. I could write pages on what could be accomplished in the poultry business, but why do it? Every one knows there is no investment that will bring the large returns that a hen will. Consider an investment of $2 in a hen. It costs to keep her a year about $1.50, making a cost of $3.50. She will produce for year 15 dozen eggs, for which you can name the lowest price $4.50. Sell the hen for $1.40 for market and you have a net profit of $2.40 on an investment of $3.50, almost fifty per cent. return on your investment in 12 months. The poultry business as a commercial business surpasses any line of investment. From the fancy poultryman's standpoint this same hen would have made about three times the amount of money.

The possibilities of the poultry business is beyond conception. Several years ago when I sold ten thousand dollars worth of White Plymouth Rocks a year I thought it a wonderful thing. Now if I do not sell from forty to sixty thousand dollars worth a year I wonder what is wrong. The future has great things in store for the poultry business.

By W. R. Curtiss Co., Ransomville, N. Y.:

Your letter received and contents noted. The possibilities in our line of business were never greater than at the present time, nothwithstanding the high price of feed and the lack of corresponding increase in the price of the product, when we call to mind the crude appliances that were in use a few years ago. We can safely say that there is no branch of agriculture that has made the rapid improvements here in this line, that the poultry business has been able to achieve.

We can say that there is as much chance for improvement in the future, as there has been in the past, and the demand for high class stock and eggs and the possibility of producing this class of goods at a reduced cost, makes this business very attractive at this time.

By Eugene Smith, Aurora, Ill.:

I am in receipt of your letter of the 11th inst., regarding the outlook of the fancy poultry business.

So far as my egg sales are concerned this year, I would say that I have sold 75 per cent. more than I did last year. It appears to me that business in the fancy bred line is going to improve from now on and that there is going to be a big demand for quality birds this coming season.

I believe "the possibilities in poultry breeding" are greater now than at any time in the history of the fancy.

By R. N. Barnum, Foxhurst Farm, Lime Rock, Conn.:

I believe "the possibilities in poultry breeding" are greater than they have ever been and certainly far greater than they have been in the past three years. Our business here I presume has been as good as we can expect or could expect under the existing business conditions.

In the case of our Black Orpingtons we believe that they have never been thoroughly appreciated by the public in general from a utility standpoint. They have been conceded by almost everyone to be the most beautiful show bird in existence, and as a fancy rank with any feathered bird. We have experimented for the past 12 years here with all of the leading varieties, and have no less than a dozen today. Our experience has taught us that if properly handled the Black Orpingtons will lay more eggs during the natural season for laying, or from 5½ months old up to the middle of May than any bird that we have every known, barring none. They will not lay as many eggs as some other birds during the entire year, but they will average better than most of the heavy breeds, as they will produce this number of eggs as cheaply as any other. More Orpingtons are ruined by too much care and too much food than any other cause. They can be housed and yarded with the cheapest equipment, as they stand any amount of cold and can be kept easily in a yard with a three foot fence.

There are no better mothers. They are the easiest bird to break up setting and last but not least, the flavor of their meat we believe is surpassed only by the wild partridge. This is not only our own opinion, but that of hundreds of customers and friends.

Some day we hope to see them ranking with the Plymouth Rocks and Rhode Island Reds in popularity, and feel sure that this time is not far distant. Our inquiries are greater today than they have ever been. Our saues about average. We believe this to indicate that as soon as business in general is better and as soon as the people have been a little more enlightened on the merits of the Black Orpington, there will be a natural boom for them. By this we mean that they will sell on their merits without the advertising of $10,000 hens, etc.

By Matt W. Baldwin, Sioux City, Iowa:

The future of the chicken business can only be judged by the past and such lessons as are learned are quickly forgotten, therefore, it behooves us all to live in the present and prepare for the future, and preparing for the

(Continued on Page 358)

POSSIBILITIES OF THE BARRED PLYMOUTH ROCKS

***The Popularity of the Barred Plymouth Rocks Is Founded Upon Their General Worth As a Most Practical Bird.*---By D. F. Palmer.**

THE success of practically every branch of the Poultry Business depends on the thoroughness of the work put on it, both in the office and in the field. Many failures in the Poultry Business, no matter how expensive the plant and equipment, may be traced to an utter lack of practical experience and common sense. The phenomenal success of many of our larger poultry farms may be traceable directly to the high efficiency of their managing and executive staff. The troubles of many poultry farms going down in commercial defeat, start from an inadequate and inefficient management or from the failure to raise the proper breed of poultry to gain the results to be desired.

From the preceding it will be seen that the work of the manager or superintendent and the proper selection of the breed has a vital bearing on every phase of the truly successful poultry farm.

There was a time, years ago, when every farmer owned a flock of chickens, but not one of these farmers gave any thought to the quality of their flocks. In later years a few of the farmers in every community began to make small exhibits at their local fairs, held annually in the fall of the year. These exhibits were the means of developing a sort of rivalry in the communities among the different farmers, and as the years passed by it was noticed the number of exhibitors became greater, the quality became better, until the people throughout the country have become educated to the fact that the raising of poultry is a business all by itself. In the past fifteen or twenty years the raising of poultry has developed to such magnitude that today the world's poultry business amounts to nearly a billion dollars annually. Practically every city of any size throughout the United States holds poultry exhibitions annually and at the largest cities, viz: New York City, Boston, Pittsburgh, Philadelphia, Chicago, Kansas City, St. Louis and others, hold exhibitions every year where every breed of poultry known is on exhibition and representing every state in the United States.

THE CROAKER

Once on the aidge of a pleasant pool,
Under the bank where 'twas dark and cool,
Where bushes over the water hung,
And rushes nodded and grasses swung,
Jest where the crick flowed outer the bog,
There lived a grumpy and mean ole frog,
Who'd set all day in the mud and soak
And just do nothin' but croak and croak.
Till a blackbird hollered, "I say, yer know,
What is the matter down there below?
Are you in trouble, er pain, er what?"
The frog sez, "Mine is a orful lot;
Nothin' but mud and dirt and slime
Fer me ter look at jest all the time.
It's a dirty world!" so the old fool spoke.
"Croakity-croakity-croakity-croak!"

"But yer lookin DOWN!" the blackbird said;
Look at the blossoms overhead,
Look at the lovely summer skies,
Look at the bees and butterflies;
Look UP, old feller. Why bless yer soul,
Yer lookin' down in a must'rat hole!"
But still with a gurglin' sob and choke
The blame ole critter would only croak.
And a wise old turtle, who boarded near,
Sez to the blackbird, "Friend, see here:
Don't shed no tears over him, fer he
Is low-down, jest 'cause he likes ter be;
He's one er them kind er chumps that's glad
Ter be so mis-rable-like and sad;
I'll tell yer somethin' that ain't no joke,
Don't waste yer sorrer on folks that croak."

It is a well known fact that there is invariably a more popular breed in every show room, and we believe without any doubt whatever, that one of the most popular breeds to be found in the show room and on the farm is the Barred Plymouth Rocks. It is on this favorite breed that this article is being written and it is our purpose in writing same to tell something of the Possibilities of the Barred Plymouth Rocks.

There are so many different features to be considered that we believe the possibilities of the Barred Plymouth Rocks is by far greater than in any other variety known to the poultry world. There was a time when a man engaged in the raising of exhibition poultry paid no attention whatever to the untility (meat and eggs) side, and on the other hand a man engaged in the raising of poultry simply for marketing purposes did not care whether his chickens were thoroughbred or just mongrels. However, times have changed and today the largest poultry plants give particular attention to the breeding of all their fowls and by proper mating they have been able to produce larger birds and heavier egg production.

To the fancier, the Barred Plymouth Rocks offer the greatest opportunity for his skill for a number of reasons:

1st. He can suit his taste as to making a specialty of the different matings, whether it be to produce exhibition pullets or exhibition cockerels. With the solid color breeds such as the white varities or the reds, the only thing to breed for is shape and color. With the Barred Rocks so many points must be considered that the field for expert managing to produce quality birds is what appeals to the true poultry fancier.

2nd. In the comparison of number of entries in the various poultry shows, the Barred Plymouth Rocks invariably out-number the entries of the other varieties.

3rd. There are so many who breed and raise the Barred Plymouth Rocks that it is never a hard matter to dispose of all stock and eggs for sale.

To the man who wants to raise poultry for market and egg production the Barred Plymouth Rocks offer the greatest opportunity. A careful study of the reports from the different egg laying contests held throughout the United States shows that the Barred Plymouth Rocks compare most favorably with the other breeds and in many contests have carried off all the honors for egg production. These egg laying contests have been one of the reasons which has caused the breeders to develop larger bodies, higher egg production and higher per cent. in fertility.

The Barred Plymouth Rocks offer every opportunity to the commercial poultry man. They mature very near as fast as the other varieties, including the lighter breeds. June hatch chicks developing to maturity by fall and for exhibition purposes they are in prime condition for the late December and January shows. They take on flesh rapidly, easily weighing ten pounds and over. They are not near so susceptible to the poultry diseases and stand the cold winter weather as well as the hot blistering sun in the summer months much better than the lighter breeds. When dressed for market their rich yellow skin presents a very nice clean appearance and it is a well known fact that in many markets the Barred Plymouth Rocks bring more per pound than other varieties.

The Rhode Island Reds, one of the strongest competitors to the Barred Plymouth Rocks, is being boomed by the breeders of that variety. However, after an exhaustive research, we believe that the Reds do not seem to be as hardy as the Barred Rocks in cold weaher. They also cause the fancier and untility man no end of trouble by their persistence to set. The Barred Rocks, while of a setting variety, do not offer to set near as much as the Reds and other heavy varieties. Our experience in our own yards has been that less than 20 per cent. of the females in all of our breeding yards have offered to set during the past breeding season which closed the first of this month (July).

The National Barred Rock Club was formed years ago to promote the interests of the Barred Plymouth Rocks.

Its progress has been very rapid and this club now enjoys we believe a larger membership than any other club for any one variety. The club offers excellent prizes at the exhibitions and works in conjunction with the different state organizations. Various articles appear from time to time in the Club Journal which are of exceptional value to the breeder of this noble breed.

New varieties may spring up and enjoy a wonderful growth for a time, but the Barred Plymouth Rocks will continue to be the largest exhibit at the poultry shows and the most popular breed on the farm.

(ED. NOTE—For more years than I can tell Mr. D. F. Palmer, Yorkville, Ill., has been breeding and exhibiting Barred Plymouth Rocks. We have always considered him a "leader" among the breeders and fanciers of this variety and his record of winnings is a long one, well deserved. He has proven himself a loyal champion, a true fancier and a real credit to the great poultry industry. Mr. Palmer now has his son associated with him under the firm name of D. F. Palmer & Son. Note illustration of some of their birds in this issue.—H. P. S.)

THE DEARTH OF PLENTY OF GOOD COCKS

***The Great Secret of Bringing Males Over From One Season To the Other Is In Keeping Them Free From Lice*--By H. V. Tormohlen.**

AS WE look over the various classes at the shows each winter, one thing that has been forced to our attention for a number of years is the small number of cocks, and hens, too, for that matter, compared with the pullets and cockerels? Time and again I have looked with keen interest to find a cockerel that was an exceptionally fine bird back in the show room as a cock, and have been disappointed when the breeder would say, "He didn't moult out right," or "he went to the bad," or some such phrase, indicating that the bird was no longer the bird he was as a cockerel.

In many cases domestic fowls have been known to live 10 to 15 years. Then why should a bird in the hands of a breeder serve his usefulness in the space of a year and be no longer fit for service in the pens or show room? I have watched the matter carefully for a number of years and have decided it is a plain case of carelessness on the part of the breeder in the great majority of cases. True, in many cases the cockerel that was such a promising specimen does go to pieces and absolutely does not have the quality that he had as a cockerel. But I am talking about the outstanding good cockerels that should make good cocks for two to five years, if cared for properly. Then many birds loose their comb by an accidental cold night overtaking the breeder before the winter is over. This too, should be really credited to carelessness.

The great secret in bringing males over from one season to another I believe is in keeping them free of lice. Some advocate keeping the males away from the females. This has little to back it, as far as the following the natural laws of nature are concerned. I do not like this plan in its entirety, but prefer to have one to three females with a choice male. He will do much better, go through the moult in good shape and not go to pieces in the show room if put in a pen of females, or later, in the breeding pen the next season, because of his long confinement away from the opposite sex.

However it may be good advice to many to keep their males separate for the summer and moulting season, for if they go to this trouble to tend to the bird they will quite likely keep him free of lice and mites.

All males are lazy about keeping themselves properly plumed and free of lice and the females of many varieties are of the same disposition, especially as they get older. So the great secret in bringing a choice male through the moult properly is to keep him free of lice, for you can never depend a minute on him doing it himself. You can feed him most anything, so he gets plenty of feed, and if he is kept free from lice he will come through the moult in grand style and as good or better cock than cockerel. My standby in keeping body lice off of birds is an application twice a year, at least, of blue ointment, a quantity size of pea, rubbed about the base of the feathers one inch below the vent, where body lice congregate most frequently. Then a little rubbed above the vent in the same manner. I also use powder occasionally, but it does not matter what you use so much so you keep the male free of lice. Of course nothing must be used that will soil the feathers. I never believe in dipping fowls, although some still advocate it.

My policy has always been to weed out the inferior quality in the flock unmercifully, but when I get a good bird, hold on to it as long as it is in good physical condition. Along this line might state that I have a hen that laid a number of eggs this season again that was hatched in the spring of 1907. She won first prize as hen at Indianapolis when 7 years old. A fellow fancier, J. C. Williams, of California, showed a bird in Chicago in 1913 that he stated was then nine years old. She did not win, but nevertheless still showed strong vitality and quality. I have made no pet of the hen above referred to, that I own, but she has never been greatly abused with lack of attention or lousy with body lice. At five years of age she nearly died with canker of the jaw, but I pulled her through, and to show that a hen can recover from a severe illness and still be a good breeder, could produce the breeder who owns one of her pullets, which I sold last fall at a good figure, which won first prize at a leading state show. Sold several of her sisters as well for a good figure.

So you can see I am not strong on the plan of cutting the head off of a chicken the minute they droop a little. A fowl, if it has been properly cared for, has a wonderful lot of vitality and can pull through a severe case of illness, while I have seen apparently strong birds die within a day or two, and upon examination find that they were literally alive with lice.

Keep the birds intended for show in a nice cool, shady place, and upon green grass if possible. With a little extra feed, a little extra attention and you will be agreeably surprised and amply repaid for your trouble in the number of high class fowls you have for show this coming winter.

A WHITE LEGHORN CITY OF INDUSTRY

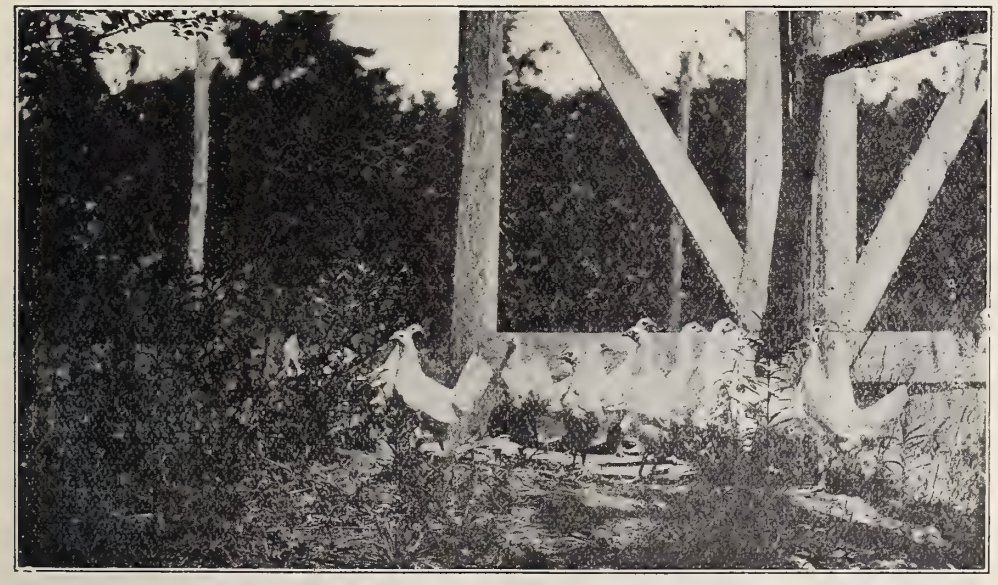
An Interesting Visit To a Progressive Poultry Farm To See How Things Are Done.

By Willard C. Thompson.

AN AUTOMOBILE TRIP down along the Atlantic Coast of the central part of New Jersey takes one by some of the most interesting farming country in the state, if not in the East. The reason why this particular section appeals to those interested in agricultural pursuits lies mainly in the fact that there is to be found systems of farming that are extremely intensive in nature. Fruit, vegetables and particularly acres and acres of the finest potatoes grown in the country, and poultry demand the greater share of the attention of the people living in these seaboard counties. For miles along the coast and extending for miles inland the sandy soils predominate, soils that are especially adapted to the raising of such crops and to the successful handling of large numbers of chickens. The climate is mild and moist, being near the great Atlantic. The roads are among the most wonderful in the country, along which every day pass thousands of motor cars, carrying the people of the coasts' resorts from place to place, as well as many interested tourists. All these things have had their part in developing this country along the lines of intensive production, making the most possible from a few acres.

MANY POULTRY FARMS

Much of this country through which we rode along in June is more or less covered with oak and pine under-



S. C. W. Leghorn Pullets cornered before the Kodak.

growth, so that the general appearance of the landscape is that of a wooded region, without, however, the thick forests of old trees. These stretches of semi-forested acres furnish ideal conditions for the rearing of poultry under almost entirely natural conditions.

As we motored along the country roads between such places as Lakewood and Toms River, we passed many farms on which we saw large flocks of pure white chickens running in the orchards, gathered in flocks under shade trees on the ranges, or about the long laying houses that brand a farm at once as a poultry farm. One place seemed to have an especially large flock of what appeared to be growing pullets on the range, so we turned in at the gate to make a visit to this farm, which has been turning out wonderful utility Leghorns, as well as good Standard-bred stock, for the last few years. As we made a trip about the plant accompanied by the owner, the importance of careful and systematic management of the many details which go to make up a place of that kind was impressed upon us. This farm is typical of many in that locality. They differ much as the personalities of the managers differ. After all, the personal or human element has a great deal of influence in the controlling the affairs of a poultry plant.

IDEAL RANGES FOR GROWING STOCK

There are some fifteen acres of sandy loam land in this farm, the greatest part of which is given over to use as ranges for the growing stock during the summer months and the runs for the mature birds in the laying and breeding pens. Almost the entire amount of feed requirements for the birds on the plant is purchased from other farms and grain dealers, thus requiring little acreage to be taken from these ranges for growing crops. This system of management is but another indication of the intensity of farming practices characteristic of the place. To return directly to the ranges, which were roughly divided into two parts, the larger for the accommodation of the pullets and the other, much smaller, for the cockerels which had been saved for breeding purposes. The pullet range was the center of interest at the time we were there, for there were over five thousand fine, vigorous, healthy birds scattered about over the field.

Two long lines of colony houses afforded shelter for these pullets at night, and protection from enemies of one kind and another. The striking feature about the colony houses was the immense number of them. Each house was about four by six feet in size and was the home of not more than thirty or thirty-five pullets, the greater part of them housing but twenty-five birds. No house was overcrowded, and this was one of the secrets of the success which this man has been having in the rearing of strong, vigorous pullets.. If growing birds are forced to stay at night in crowded, ill-ventilated colony houses, there to breathe in time after time air that is laden with poisonous gases and robbed of its load of oxygen, it will be but a matter of time before they will commence to show the effects in a very decided way by gradually growing weaker, refusing to eat, drooping the wings and dropping off one by one. No such sickly looking birds were on that range. In several of the colony houses were some younger pullets which had been recently moved onto the range and were still confined in a small yard directly in front of the houses. Every house was painted white, adding much to the appearance of the long line of houses, as well as to life of the houses themselves. Paint is an indispensable thing on any farm. Buildings will have twice their original length of service if they are well painted and kept up. Weather conditions do not have a chance to rot the timber in them. On the inside of every house it was noticed that there were no rough, unplaned boards to catch and hold dirt and filth. Good lumber had been used and driven close together so as to form an even, smooth surface on the inner walls. The floors of the houses were thinly littered, enough for summer time, and were in good condition. There were no accumulations of filth

and manure which would fill the houses with bad odors. In each colony house the best of environment was afforded the birds that perched in them at night. Roominess and cleanliness are two characteristics that every colony house must have, if pullets such as raised on the farm visited are to be brought through their period of development without set-back or stunted period. I have described somewhat in detail the colony house arrangement as we saw it on that poultry farm, because it is true that many, many poultry raisers and men who think they know all the secrets of the business too, sometimes, do not appreciate the importance of the colony houses to the rapid, continuous growth of chicks during the summer months.

The abundant and plenteous shade which was everywhere a characteristic of the range was one of the important factors in the steady growth of the Leghorn pullets that were scattered here and there under small oaks or clumps of scraggly pine trees. Shade is an essential element in the summer management of growing stock of all kinds, and especially of fowls. The direct rays of the summer sun cause many deaths every year in the poultry yards. The birds cannot withstand the scorching rays any better than can man, and oftentimes not as well, for their bodies are much smaller than ours. They need protection during the heat of the day. A satisfactory range must have some source of such protection, or shade. Natural shade is to be preferred, because it is in first place ideal shade, and in the second place requires no extra labor in the furnishing. When locating a poultry range the possibility of obtaining natural shade should be seriously taken into consideration. Growing stock appreciate it. On this farm it was unnecessary to provide any artificial source of shade, as the natural undegrowth furnished the most perfect shade possible to obtain. But on some farms visited in the same trip it was found necessary to plant corn, which with its wide leaves furnished agreeable shade, or sunflowers, which with their large leaves and tremendous flowers formed a massive shade, or even to erect tents by stretching burlap bags over branches of trees. Under these shaded places were seen many holes in the sandy soil which had been hollowed out by the birds in dusting themselves, thus keeping their bodies rid of lice and other body vermin.

At probably half a dozen different parts of the pullet range were water troughs which were kept filled with running water, pure, fresh and cold, a wonderful gift to the birds that stood around them enjoying good, cool drinks on hot days. The range had been piped with half-inch pipe from a water main, and in these various watering places water faucets had been attached and were allowed to emit a small stream of water all the time, keeping the supply always fresh and insuring against empty troughs on hottest days. Pullets, and in fact all growing birds, need a tremendous supply of water in order that their food can be properly digested, and their bodies, which are largely made up of water during the growing season, be built up normally and steadily. The size of the stream from these faucets depended largely upon the number of birds that were accustomed to drinking at the trough. It had been learned by close observation on the part of the man that was caring for the range about what size of stream kept the troughs always filled, without running over to any amount worth bothering about. Ordinary wooden troughs had been made for the use of these range birds. The greater part of them were about eighteen inches from the ground on a small slatted bench, provided with a roof to shade the water from the sun. The troughs were about thirty inches in length and accommodated a good many birds at a time. On any poultry farm or general farm where chickens are kept careful attention must be given to the water supply during the summer days particularly, even though it is an extremely important part of the chores throughout the year.

Near the watering troughs were to be found several out-of-door dry-mash hoppers, so constructed that the rains could not get into them to spoil the mash. About these in every place on that range that we went were at least a dozen birds, picking at the mash, which was making their growth possible. The mash itself was a regular growing mash, containing considerable bran and meat scrap, both high in protein, that element of food material which makes the muscles and bones, and is so important an ingredient of all growing and egg-producing mashes. These birds had free access to these mash hoppers throughout the day and were receiving in addition a mixture of wheat and corn, fed morning and evening in front of the colony houses. In this way the pullets had been trained to come to the colony houses in the open at feeding time. The feeder could then look them over carefully and by starting this practice as soon as the birds were placed on the ranges, they were taught to roost in the colony houses at night instead of in the trees. The practice of looking over the birds on the range every day is a most important one. It gives the manager a chance to see just what kind of growth is being made, to detect sick birds and determine what has caused any such trouble at once, and to gauge his feeding methods by their actions when fed, cutting down on the grains when they show a tendency to pick it up slowly and to increase it when they appear particularly ravenous. When the owner gives his shrill, piercing whistle, which could be heard all over the range, hundreds of snow-white birds came out from the bushes which had been hiding them. Even though they were Leghorns, they came quite close to us. They trusted the feeder, and knew that when he called it meant meal time for them. I cannot imagine a prettier sight than those clouds of white birds coming from all directions. It certainly was one that would please the eye of a poultry lover. Those birds were out on that range enjoying the best of natural environmental conditions. It seemed an easy thing to do, but there are many who are trying the poultry game every year that can not show such flocks Why is it?

Shade and Green Food are Absolute Essentials for Rapid, Continuous, Healthy Growth of Range Chickens.

As we neared the farther gate leading from the range and looked back of us at the hundreds of pullets then going back into the bushes again, it seemed to be impressed upon us that in order to have such results much forethought and careful management must have been planned by the man in charge. He had arranged colony houses, water faucets and troughs, food hoppers and nests in such manner as to economize to the greatest

possible extent in time and labor, and still afford proper conditions for the pullets. It required an understanding of the surroundings that growing birds need, and the meeting of those conditions as far as it was possible to do under his location. He had cut down the labor item on his farm to a minimum. One man can handle many birds, if things are made convenient and he understands bird natures. It means a greater efficiency in the man himself.

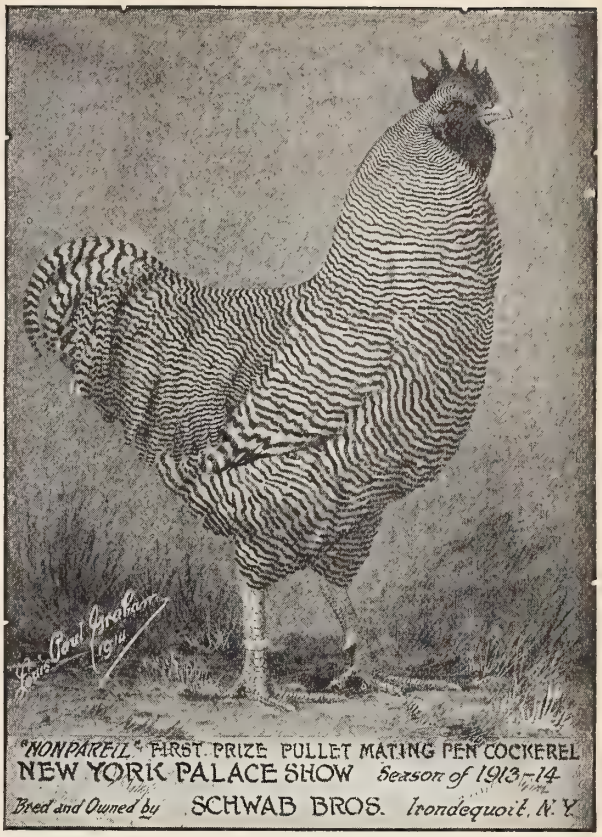
AND THE COCKERELS, TOO

Earlier in the spring the greater part of the Leghorn cockerels had been sold from the farm as broilers, weighing right around one and one-half pounds. This had taken place when the youngsters had been ready to move from the brooder houses to the ranges, the pullets being placed on the range which I have just attempted to describe and the cockerels either sold as broilers or saved to be either sold or kept as breeders another season. The better individuals among the young male birds had been saved as possible breeders. Those with bright, bay-colored eyes, well-pointed and carried combs, alert, active carriage, rather low-set tails and lengthy backs, were put by themselves in smaller ranges on the other side of the road. They were divided up into smaller flocks, not more than forty or fifty being kept together. Usually the age had been the factor in dividing the flocks, about the above named number being selected from each brood taken from the brooder houses These cockerels, the greater part of them, were about two and one-half months of age and were well on the road to maturity. It was amusing to watch some of them in their first attempts to assert their importance by crowing, some succeeding and others ending the attempt in coarse crackling cackles. The males thus selected were allowed to range over the small fields around their respective colony houses until about the middle of the summer. Then it is planned to cull them again, this time leaving only such individuals as the owner considers worth putting into his own breeding pens. Many, in fact the large percentage of them, are sold to smaller poultry raisers that are producing Leghorns, and want new cockerels from a well-known strain. This is one way in which this man, as well as many other poultrymen in New Jersey as well as elsewhere, is building up a reputation for good stock that produces results. He sells only such birds as he thinks fit to enter his own pens. Careful and constant selection is required to build up the quality of any poultry stock. The culled stock should be sold as market stuff, not as breeding stock, for in that practice the name of the farm will not be synonymous with high grade in stock and products.

THE FOUNDATION STOCK

Back of all the fine pullets on the ranges and the cockerels that crowed so lustily in their pens, are the breeding birds that we saw in the yards outside the long houses in which they had wintered and now were being carried through the summer. We walked through the long laying breeding house nearest the road and saw many of the old, matured fowls that had produced hatching eggs during the spring, busily scratching for their cracked corn and wheat. They were true Leghorns, but unlike many Leghorns that we often see, were long bodied and deep bodied These characteristics indicated a development of those parts of the birds' bodies which had to do with the production of eggs, namely, the digestive and reproductive organs. The combs were large and gracefully lopped over to one side of the head. The hens were wide awake, active and vigorous, exhibiting in every move the strength and vitality which had been noticed as a prominent characteristic of the youngsters on the ranges. Like produces like. The male birds which had been mated with these hens during the hatching season had been removed. The choicest individuals among them had been placed in the cockerel house in separate pens to spend the summer. The others had been put onto the market as soon as the hatching season was over. In those pens sterile eggs will be produced for sale to the coast resorts with their large summer population of New Yorkers, principally, who demand white shelled eggs, and are willing to pay for good quality at its worth. In the next line of laying houses were the laying stock which had been producing sterile eggs all the year around, never having been mated with male birds. The highest quality of market table eggs are those produced under just such conditions as these. Heat does not start germination in sterile eggs, as they have never been fertilized.

The owner informed us that along in the later summer months he would go over the entire laying and breeding stock of several hundred and even thousands of birds, selecting out those oldest birds that had passed their second year of egg production, and those individuals among the younger birds that lacked those characteristics that indicate high performance at the egg pail, such as depth and length of body, large development of comb, brilliant red color of head parts, etc It was his plan to cull the flocks down to almost half their original number, filling the empty places with the pullets which we had seen on the range. In this way he manages to keep the laying pens filled with a majority of pullets, which are bound to produce heavily in their first year, and the breeding pens filled with birds that have gone through one or two years of egg production. He wants in the laying pens individuals that will produce a maximum number of sterile eggs for the market. He wants in the other pens hens that are fully matured, of known high egg production, to produce hatching eggs for the next spring's hatching season. These birds will not be forced for high winter egg production, as will the layers. It is merely a matter of managing laying and breeding stock so as to obtain highest results in desired ways.



AND LOOKING AT EVERYTHING TOGETHER

It was nearly six o'clock when we had finished talking about how he was planning to cull out the layers, so that we could take but a passing glance at the incubator cellar and brooder houses. Both were well equipped and perfectly clean. As they are the places where the pullets and cockerels get their start, it is absolutely essential that everything about them should be clean and sanitary. It was especially noticeable in the brooder house that sunlight was recognized as a powerful friend of the poultry raiser. Nature's best and most effective disinfectant and germ destroyer was allowed and invited into the brooder house through a series of overhead windows, for the house was composed of two rows of brooders on either side of a central aisle, along which we walked as we hurriedly looked over the empty house.

As the automobile took us up through a portion of that celebrated Monmouth county, the agricultural products of which have made it a famous part of New Jersey, we saw many other poultry plants similar to that which we had just left, but hardly as large and many of them not as thrifty and practical as that one had been found to be What we saw there brought out many lessons that a poultry raiser should learn. Poultry was given a fair show to win out there, and it has done so.

THE HOUDAN FOWLS

The Breeder's Opportunity. Houdan Origin and Characteristics. Advice to the Beginner. Standard Requirements.--**By John A. Gough.**

ONE of the American leaders in the newspaper line recently made this statement:

"Soon, let us hope, war will stop, and then will begin the greatest advertising campaign that the world has ever seen."

"What a magnifiicent thing it would be for this country if the government could clearly understand what national advertising means and if the United States could begin NOW the great campaign of National development throughout the world that will then be begun with terrific energy by these other nations."

In this line of thought, one cannot help but observe that the same fact is also true, of the affairs of the American poultry industry and it really is a question of whether the American poultryman in general is going to be in a position to take advantage of the opportunities that will arrive at the conclusion of the conflict and reconstruction commences.

In New York City there recently arrived the members of the "Chinese Industrial Commission," their errand being one to promote trade between China and the United States. His Excellency, Ambassador Kai Fu Shah in speaking of American interests in Foreign Commercial Centers, stated that in his personal opinion there was room for great improvement, as American producers in general neglect to study the wants of foreign trade. As we seem more inclined to take a chance on their liking what we choose to give them, rather than giving due consideration to their personal desires and offering them what they unquestionably want, and in making comparisons on this issue drew attention to the fact that the United States only enjoyed 8 per cent. of Chinese trade, while up to the commencement of the war the British Empire has been getting 51 per cent. To quote from the Ambassador's speech, he stated:

"You may think we need a great many pairs of shoes in China. We do, but if you want to sell us those shoes, you should offer us the kind of shoes we want, and not what you think we want."

This is precisely the particular feature, that the American Poultry Fancier should give every consideration if he wishes to secure any of the trade that will be offered at the conclusion of the war.

There is not a portion of the world wherein Poultry Culture had reached such magnitude as it has in France and Belgium.

The French national dish is the domestic fowl, and greater quantities were used in France for food consumption than in any other country by almost 100 per cent.

In a recent Editorial of Everybodys Poultry Magazine the attention of our readers was called to the fact that the poultry industry, in both Belgium and Northern France was not only destroyed, but was practically wiped out entirely.

The trade in these two portions of Europe was of such proportions that it seems absolutely inconceivable, but from most reliable sources we can safely affirm the truth of the statement.

At the same time the reduction in propagation of poultry is not confined to simply these two countries, but has affected the whole of Europe, only in a lesser degree.

Now will the American fancier try to secure this trade or is he going to neglect it.

There is a fallacy very much believed in "That Opportunity knocks but once." This is not a fact by any manner of means. Opportunity is forever knocking, but we are deaf and do not seem to hear. Yet opportunity is surely going to knock for the American poultryman very soon, so loudly that even those that are absolutely deaf will be able to hear the noise, and then, dear readers, it will be up to you. "You will hear her, but will you be able to comply with her demands?" She will ask for the goods, will you be able to deliver them? When France demands that her great Poultry Industry be reconstructed and her stock replenished will you have the variety of fowl that the French Fancier will demand?

Are you going to make your preparations according to what they will desire or are you going to try and give them "what you think they ought to want?" If not of the latter type, then the "Wise Man" will begin to study the demands of the French Poulterer, and he will discover that the breed that is the French National Fowl is Monsieur Le Coq La Houdans.

The Houdan is the Gallic fowl par excellence and may, be better described as the Dorking of "La Belle France," and this breed, friend reader, is the one that the French Fancier will not only desire, but will also demand.

It is really difficult to secure precise particulars as to the origin of the breed, as its origin is lost in oblivion, and up to the present little of real authentic information has been available, and to our personal opinion, we are not altogether sure that the efforts that have been made to secure such information, have not (in America at least) resulted in detrimental experiments in their breeding that had been much better if not indulged in.

The true "Houdan" shape, we might state for the benefit of the uninitiated, is precisely the same as that of the Old English Dorking. This breed being one of the best known, both in England and America, as matter of forty or fifty years ago, resulted in the argument being advanced that the "Houdan" must be of a combination of this breed and some variety of crested fowl.

In the light of poultry affairs today, one cannot understand how that any such idea could prevail, unless there must have been the authentic reason for doing so.

Yet when one considers the attitude assumed by the poultry writer and historian of fifty years ago, there is nothing at all strange in such ideas.

Previous to the late forties there was little or nothing that had been written on the subject and works devoted to such a thing as the "Domestic Fowl" were deemed toally unnecessary. In consequence the little that can be obtained of any date previous to this time, will only be found in works on "National History" and in "Travelers' Tales."

These latter account for some of the strange conceptions advanced as to the origin of the Domestic Fowl in general.

Taking the English and American writers of these earlier times they assumed that the more common varieties must be the practical original breeds.

"The survival of the fittest" being the entire conception of the natural law and that all foreign breeds must be offshoots from these particular breeds.

Without the slightest consideration for the fact that perhaps Asia should be given credit for the "origin" of the domestic fowls, with little consideration for any portion of Europe at all.

When these matters are given full consideration there is not the slightest reason why the "Houdan" should not have been originated at a period earlier than that of the "Dorking." However, the Houdan is supposed to have been introduced in England in the late forties or early fifties and as before stated, from its remarkable resemblance in shape to that of the "Dorking" it was believed by many to be the propagation of that breed and some one of the early "Dutch" Poland Fowl, later when it was discovered that France also possessed a breed known as the "Crevecoeur."

Then this breed was given the preference by many in opposition to the Poland breeds.

The writer of this article has made a long and exhaustive study of the origin of the Domestic Fowl, and must state that in our personal opinion, that the "Houdan" is not the progeny of any cross, of any breeds of fowls, known in Europe or America for more than a century, but that it is nothing more or less than the consummation of selective breeding, for the purpose of utility.

To any fancier or breeder of experience the truth is perfectly comprehensible, when I state that to secure the "Acme of Perfection" in utility purpose, "i. e.," the best table qualifications with greatest egg production. No matter what the aim of the producer or the type, if this is the aim and purpose persisted in such breed will eventually revert to the well known "Dorking" shape when it arrives at its consummation.

First, as the "Dorking" has always stood for the util-

ity fowl, "perfect" in England, just exactly the same has the "Houdan" in France.

As I have already stated these misconceived ideas prevailing relative to the origin of the "Houdan," have proved exceedingly detrimental to the breed both in Great Britain and America for insomuch that many fanciers desiring to improve their flocks by the quickest means available, have erroneously reverted to Mongreligation instead of breeding for purity of blood absolutely.

Personally, at the same moment, we are doubtful if there are any "Houdans" in existence whose blood lines are so pure as certain flocks found in America today.

Without doubt the writings of Mr. S. W. Thomas, president of the Houdan Club of England in 1890, in which he affirmed that he was quite sure that the "Houdan" was the result of a cross between the Crevecoeur with the "Sultan' or some other breed of that type and possibly the 'Dorking" added later to develop shape, caused many to introduce an infusion of these bloods into their flocks, that would never have dreamed of doing so otherwise.

Another trite statement made by Mr. Thomas at this time should be given due and full consideration by any one in any manner interested in the Houdan fowl. He states:

"Of the various crosses with the Houdans that I have tried, by far the greater proportion of chicks come quite or nearly black."

Mr. Louis Wright, in 1885, gives no practical experience for evidence in support of his opinion, but affirmed simply that the resemblance in shape to the "Dorking" evidently proved that this crossed with a "White Poland" would produce the Houdan.

Now how such foolish and what one might class as idiotic impressions as the foregoing instances, should be allowed by expert fanciers and breeders to prevail publicly unchallenged, is beyond our personal comprehension.

For such being the case, any one desiring to produce an exclusive and exceptional strain of "Houdans," all that would be necessary would be to make such crossed and with only a mediocre degree of intelligence in breeding the most wonderful specimens would have easily been produced.

Now, as a matter of fact, the introduction of the "Dorking" blood into any "Houdan" flock will bring with it a most unsightly and objectionable creaminess and brassiness in color of the plumage that will continue throughout innumerable generations, in fact, it will absolutely spoil the flock.

Again, the introduction of "Crevecoeur" blood will result in black or almost entirely black progeny, and many four-toed chicks for many subsequent generations, and not only this but the blocky utility shape will deteriorate and the smooth, slick contour of the "Crevecoeur" or "Poland" will prevail.

To the beginner in the "Houdan" fancy I would advise that they secure a copy of the American Standard of Perfection before purchasing stock or eggs and read most carefully the instructions therein relative to this breed, giving the greatest consideration to the note inserted at the head of "Houdan" description and reading as follows:

"There is a certain regularity in the color of plumage of this breed that, too often, is overlooked. The glossy, black feathers should be tipped regularly with white in the proportion of about one tipped feather to five black ones, a splashy white is not desirable."

The last clause seems to have been interpreted by the majority of persons judging "Houdans" to mean that in the choice of a specimen of the breed in the show room, having a white tip more than one-third down, such specimens should be discarded, and the prize given to a pure black bird, which should in reality be disqualified for in absolutely reality the genuine "Houdan" will always have more "white" in its plumage than will the Mongrel.

The chief objection to the infusion of foreign blood into any Houdan flock is the fact that it will always result in a very much inferior type of egg producer than the pure blooded fowl will be found to be.

In breeding the "Houdan" be sure to purchase the fowl having the white tipped plumage, as this is the chief characteristic of the breed as mongreligation of the "Houdan" will have to be indulged in most extensively before it will be revealed in crest, shape or number of toes.

"Never accept a fowl minus the fifth toe," neither let one deficient in muffs be palmed off on to you. They both are sure effects of mongreligation." In choosing your stock pick out the fowl shaped like a "Dorking," square built and of bulky appearance, a good solid body firmly carried on stout, rather thick legs and feet with a bright sparkling red eye, the head being smart and alert, a good solid beak of brown color, a good "V" shaped comb, wattles of medium length and a good well feathered beard. The ears should be white, preferably that the whiskers should be full and heavy enough to hide them from sight, the heavier and more luxuriant the better.

The crest should be compact and full rising, well up from the base of the comb, fitting well to the crown of the head. The neck well curved and arched, abundantly feathered and carried very upright, of fair length, a good broad back sloping slightly toward the tail, the wings well developed and carried closely to the body. A good wide saddle well feathered. Breast should be broad, very full and fleshy, carried well and blockily forward. The legs short and stout, also the toes, five in number, on each foot. These should be pinkish white, although the Standard allows for mottled with black. The nails should be dark horn or black. The tail should be carried fairly upright, of good size and furnished with long sweeping sickle feathers.

The carriage of a good "Houdan" is very upright and full of life and animation. The "Houdan" cannot be excelled by any breed in table qualifications and as an egg producer is not equalled by any of the utility varieties of fowls.

For these reasons no one at all interested in poultry can make any mistake by taking up the propagation of this breed. One of the greatest experts on advertising once said, "When you wish to secure the real results and meaning of the advantage of advertising you must "get the name of your product as thoroughly in the public brain that the product and the name you advertise become synonymous."

For instance, If you say, "Winchester," in the United States, it means firearms and ammunition; "Tiffany," it means jewelry; or "Delmonico," it means food.

Likewise, if you say "Houdan," it means the perfect utility fowls. The writer will be glad to furnish information on the "Houdan," also issues the most cordial invitation to any person interested to join "The American Houdan Club."

When the nations of Europe decide to turn from murdering each other and turn back to business once more they will start a united and desperate fight to get back the business they have lost. The American poultryman that is intelligent enough to see far enough ahead will not wait until that time arrives, but will start in to raise enough stock to meet the demands and the really progressive poultry breeder will start in raising "Houdans,' and will also DO IT NOW.

(Ed. Note—Mr. John A. Gough, New Haven, Conn., is secretary and treasurer of the American Houdan Club. A breeder, judge and writer of national reputation. H. P. S.

WHEN ANSWERING ADS—
Always mention "Everybodys."

THE CORNISH FOWL

Everybody knows, or should know, the value of the Cornish Fowl for table use. The claims made for them have been amply proven, as a table fowl they have no superior. While all fowls have merit the Cornish is par-excellence. Naturally plump in construction, with full breast, yellow skinned, with fineness of grain and delicious flavor. If you have any doubts just write John W. Ward, Jr., Pennington, N. J., who will gallantly back up these sentiments.

H. P. S.

LARGE SIZED FOWLS DUE TO RIGHT MATING

***Important Detail To Raiser For Market and of Value In Show Room. Often Matter of Chance. Specimens Fully Up To Standard Known To Produce Undersized Progeny.*--By J. Harry Wolfsieffer.**

SIZE, though not the most important attribute in the composition of the domestic fowl, is, nevertheless, a detail of considerable importance, when the production of the most salable quality of stock is aimed at. In the first place, size is of great advantage in the "dead meat" market.

In the show world, likewise, has size (all other things being equal), dominated the situation to such an extent that a bird's value is often doubled, and in some instances, trebled, as a result of the possession of this particular quality. Small birds of good type, sound color and slightly below standard weight, may for argument's sake, be readily salable at good figures, and the heavier birds of equal type will sell at advanced figures.

In obtaining size in a given flock there is, as in almost every undertaking, a right and wrong way to proceed. The question of producing creditable size is a very large one, yet to the breeder endowed with average intelligence it is by no means an insurmountable one. In the first place, it is necessary to possess some slight knowledge of the factors bearing on this subject, and to be able to handle them on accurate and methodical lines. It will always prove a difficult task to impress size on the progeny of any flock whose pedigree is not carefully tabulated and recorded in a manner that speedily permits of the progenitors of every individual member of the flock being instantly located. Expert authorities all agree in denouncing the policy of resorting to the use of small specimens of either sex for reproductive purposes. The advice under this heading is prefectly sound and logical in the main, but unfortunately for the bestowers of this advice, no infallible system of forecasting events has yet been discovered, and the results obtained from union of undersized specimens in many instances has gone far to discount the value of the opinions expressed by them.

Size depends almost wholly on the question of prepotency, and where this item is lacking in the breeding program, it is safe to assert that no material gain in size will be observed, large-framed birds will only produce progeny of similar characteristic when this massiveness of frame is a distinct feature of their breeding for several generations. In other words, when they are especially prepotent in the matter of size, on the other hand, certain specimens that are fully up to standard requirements in regard to size will be found to produce offspring deficient in this respect, simply because this particular quality is not a distinctive feature of their breeding, but merely represents a chance in size over and above that of their parents and more remote ancestors. This is especially noticeable in male birds, many who beget progeny that fail to attain the size of their sire. No matter how well fed or cared for, it will invariably be found that these particular sires are themselves the product of birds of dwarfed stature, but by reasons of an exceptional measure of vitality have been enabled to attain a degree of growth that they are totally incapable of imparting to their progeny. The contention that like begets like, is fairly sound and unassailable up to a certain point, but the reverse is often noticed in pure-bred poultry-raising. Large birds can only reproduce themselves if this particular characteristic is a well-established detail in their composition, though medium to undersized birds may produce a limited number of chicks that will outdistance them in point of size. The rank and file of the offspring of such matings will be found to show no increase in size over that of the parents, but rather fall behind them in this feature in the majority of cases.

Though prepotency will be found to be a strong—in fact almost the dominating factor in obtaining satisfactory size and weight in the poultry crop, other details enter calculations in this connection and by reason of their importance are deserving of all the attention that can be given them. The tendency to produce large birds, even with the proper matings, may prove to be a disappointment when hatchings are conducted during the latter months in the year, when proper development is retarded and excessive heat prevents the proper amount of exercise to insure proper growth. Breeding from late-hatched chicks year after year is a fruitful cause of deterioration, not only in regard to size, but in the loss of stamina. Following these lines the poultry keeper would soon exhaust the best energies and constitutional powers of the flock and be saddled with a collection of birds that would fail to give satisfaction in either show room honors or the egg basket. When starting to attain size the first step consists in securing large fowls of either sex as foundation stock. See that these are the progeny of birds at least of equal size, and arrange to hatch young stock from them in the early spring.

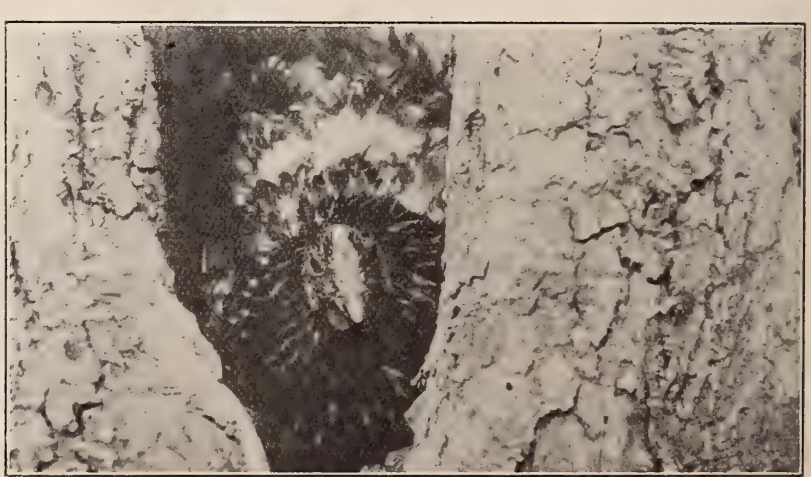
QUEER PLACE FOR HEN TO BUILD HER NEST

By Felix J. Koch

It's a saying—old as the hills, of course,—that there's never any telling how a cat will jump,—but the average barn-yard can usually paraphrase this with a homely bit of philosophy that there's never any telling which way or where a hen will build her nest.

As a rule,—the domestic hen is a creature of the earth,—the height of whose arboreal ambitions will be the top of the ladder to her chicken-house home, but, now and then, says the bookseller's boy, there's exceptions even here to the rule.

Up in New England,—not so long since,—an ordinary hen discovered an easy way to a point in a hollow apple-tree,—and there laid her eggs and all but reared her brood, in peace,



before discovered by the farmers.

Not far from here another hen found passage to the very top of a huge hay-stack; made a nest and laid a neat little collection of eggs in the picture, before her whereabouts had been discovered by the people in charge of the farm.

DOUBLE MATING AND THE BROWN LEGHORNS

***Further Enlightenment In Regard to the Double Mating Practice and History of Brown Leghorns. A Reply To the Article of Frank L. Platt In July Number.*--By H. V. Tormohlen.**

THE July number of Everybodys Poultry Magazine was on my desk several days before I had time to look over it carefully. I have just read the article by my friend, F. L. Platt, on "Double Mating Produces Standard Color," in which he refers to the Brown Leghorn as a shining example of the practice. I am afraid Mr. Platt has been misled to a certain extent at least, when in trying to show how arbitrary the double-mating idea has been with Brown Leghorns especially, he seeks to prove that not only have the male and female lines been bred far apart in the last 25 years but have, in the male line, had an admixture of foreign blood, i. e. Black Leghorn.

Mr. Platt refers to an article in R. P. J. which appeared some ten years ago over the pen of W. Theo. Wittman, in which he gives a history of his experience in introducing Black Leghorn blood to make the stripe in the male line more pronounced.

A little later in writing an article for R. P. J. on the various problems confronting Brown Leghorn breeders and the matter of proper mating, I referred also to the Wittman article. I had studied for several years the mating of Brown Leghorns and had some ideas of my own I had never seen in print. I therefore took the time to send copies of the article I wrote to five or more of the leading Brown breeders of the day before submitting same to R. P. J. The letters I got in reply are in my files today, as well as a vast amount of other Brown Leghorn lore gathered from year to year in correspondence with the various breeders.

In a letter under date of May 8, 1911, Prof. A. C. Smith, then manager of Grove Hill Poultry Yards, Waltham, Mass., now in charge of the poultry department at the Agricultural College in Minn., took me to task about the inference that all male Brown Leghorn blood today has the Black Leghorn hen blood infusion. His letter is very interesting to Brown Leghorn breeders, at least, and I quote it:

"Yours at hand. I did not read the article, (the Wittman article) you refer to, though I saw it. Wittman won largely on males for a few years at shows around his locality. The stock was originally from eggs produced here. He is said to have introduced a Black Leghorn hen. He stopped showing the male line about the time he produced a pair of the Morris pullet-line birds. The last I remember of his showing was at Philadelphia, where he showed against us, but we won the principal prizes on males and Barkestale on females. We purchased the Barkestale females and mixed with our own blood and formed the basis for our present female line.

"I cannot see how the Black Leghorn hen had anything to do with us, if that is what you mean in your article, (referring to my article). We had just as strong striping in saddle long before the Black hen was ever thought of and we never introduced any foreign blood to get it.

"I purchased a pair personally from Mr. Tate, of Tate & Baldwin, Chicopee, Mass., and the cockerel had as much striping as I have ever seen since. This was about 1885. That cockerel was the basis of our cockerel line today, as I sold my entire flock to Mr. Bright long before I was employed here. This Tate bird had, as I said, as strong striping as one would want to see. He was also a large bird and weighed six pounds or so as a cockerel.

"The pair of birds that Morris gave Wittman produced the next year, as I remember it, the first and second pullet at Philadelphia, shown by another party; first and second pullets at Boston, and the first pullet at New York. All of this stock was grey in color to my eye and the legs were very poor. Fact is, all the legs of the original Morris stock should be turned out under the clause, 'Legs other than yellow.' However, I never made any protest, waiting for the grey craze to die out, which it did soon.

"Yours very truly,
"A. C. SMITH, Supt."

In a previous letter referring to the same question Mr. Smith said:

"* * * The only breeder that I know of that introduced a Black Leghorn hen (if he did introduce a Black Leghorn hen) gave up breeding the male line three or four years afterwards, and we certainly never used a Black Leghorn hen. The breeder who is said to have introduced a Black Leghorn hen bred our male line prior to this Black Leghorn hen. We get some very strong hackles and saddles in our male line from females that do not have strongly striped necks.

Yours very truly,
"A. C. SMITH, Supt."

From the above, then, it is easy to see that the Black Leghorn hen blood idea has or had very little to do with our present male line males in Brown Leghorns, if anything at all. A light infusion of this blood may be in the veins of some strains, (and years ago when I was purchasing stock from a certain breeder he said his line was a Wittman cross) yet it had very little, and as Mr. Smith has testified in the above and as Brown Leghorn breeders of the old school will back him up, it was not necessary, nor did they resort to this cross to get the elegant stripe in the males.

My article following the Platt article in July issue on "Double Mating vs. Single Mating," seems to be a direct answer to Mr. Platt's article, although we did not know of each other's article. Mr. Platt condemns the double-mating idea in vigorous style, but does not tell how to overcome it. I did not have Mr. Platt in mind when I referred to the Red Sussex and challenged the breeders of this new variety to make a standard which would not make it easier for the leading breeders to produce the birds that win at our leading shows within five years time by the double-mating plan rather than the single. However, since the articles are side by side and Mr. Platt has referred to my favorite, the Brown Leghorns as a shining example of the evil of double-mating, I will refer to Mr. Platt in particular and ask him to formulate a single mating standard for his new chosen favorites, the Red Sussex, whereby it will be impossible to produce better birds by the double-mating plan than the single-mating plan. Mr. Platt has been a leading winner the past season and all agree, will be a fair representative of the breeders of the variety.

I cannot go at length into the mating matter again in this article, but from the experiences of the leading breeders of nearly every standard variety of poultry, the double-mating evil, if such it may be called, (but I do not consider it an evil) inevitably follows the single-mating standard by which the variety was first produced and entered in the standard under. The reasons were set out in my article.

Brown Leghorn breeders are satisfied with the double-mating standard as it now is because even an amateur cannot be misled very long into believing he can produce both exhibition males and females from the same mating, so pronounced are the differences in the two lines, while with Barred Rocks and all other varieties practicing the double-mating plan, more or less, many breeders are misled into believing that the best birds are actually produced from the same mating. The only difference is that it takes amateur breeders of other varieties several years to get onto how the high class specimens are produced at our leading shows while with Brown Leghorns the two lines are so distinct that an amateur can tell the difference in the chicks from the two lines when first hatched even with one eye shut. He is not misled a minute.

The present Brown Leghorn standard was the outgrowth of the desire of the majority of the breeders for the beautiful in the male as well as the female and the result is we have a male and a female which is considered by breeders of all varieties the highest type of perfection in the breeders' art of producing the fowl beautiful.

Let Mr. Platt hold his own against the evils of the double-mating system in his Red Sussex for the short period of five years and then see if he can come with clean hands to bewail the loss the Brown Leghorn has suffered (?) as a result of the double-mating system. Browns are more popular than ever, both as a fancy and as a utility fowl. Visit the show room or drive through the country 100 miles and note the many flocks of Browns.

EDITORIAL

EVERYBODYS POULTRY MAGAZINE

Issued the First of Each Month
Published By
EVERYBODYS POULTRY MAGAZINE PUB. CO. Inc., HANOVER, PA.

Entered as second-class matter at Hanover, Pa., April 6, 1915.

When Writing Advertisers Always Mention "Everybodys"

OUR GUARANTEE.

We guarantee every subscriber against loss due to fraudulent misrepresentation in any display advertisement appearing in Everybody's Poultry Magazine providing the subscriber when ordering th fowls or merchandise states that the advertisement was seen in Everybodys Poultry Magazine and places the order during the month or months in which the ad is inserted in our columns and notifies us of the fraudulent misrepresentation of the advertiser, giving full particulars, as soon as it comes.

SUBSCRIPTION PRICE.

Fifty cents the year. Three years for $1 in U. S. and Mexico. Canada 25 cents per year extra. Foreign countries 50 cents extra.

A Renewal Blank will be inserted when sub. expires.

ADVERTISING RATES ON APPLICATION.
SAMPLE COPIES sent free to all interested. Subscription agents wanted.

Manuscript and copy for change of advertisement must be in our hands promptly by the 10th of the Month preceeding date of issue. New business can be accepted to the 20th but no special position can be assured.

To get a true line on the poultry conditions as they are today, along with the prospects for the future, we lately addressed about two hundred letters to breeders throughout the country asking them to write their views for our readers on the subject of—"The Possibilities of Poultry Breeding." We did not do this through fear, but for the reason to satisfy ourselves that the conditions and prospects as we have seen them do really exist. This like other years we have spent a great deal of time with the poultrymen of several states, and wherever we have been this year have found conditions and prospects far better than even our fondest hopes asked for.

Without exception, the letters received express the one thought and the one condition. "Good Times" are here, and that they have come to stay| Every writer is full of confidence, which is an admirable habit, and it is most evident that the breeders now have an abundance of confidence in the future of the poultry business.

This is just the condition we have seen at all the plants we have visited, there is a healthy resume of activity noticeable, and this confidence in the future is backed up by a very large growing stock of splendid quality in every variety.

The short sales of the past two years have resulted in at least one advantage to the breeders, in that they have been able to keep more of their real good birds for their own breeding, the result of this will be seen in both the numbers and the quality of the young. I dare say that I have seen more and better young this year, than at any time in the past, this applies to most all varieties and peculiarly to White and Silver Wyandottes, Barred Rocks, Leghorns, Brahmas, Houdans, Sussex, Campines, etc.

The "Utility Question" thanks to it, has been conductive to bring out at least one effort in favor of high-grade Standard-bred poultry for it has tempted the breeders to keep records and to trap-nest, showing an increased interest in the practical values of their beauties, these records along with those made by the same quality of stock at the Experimental Stations has resulted in the greatest possible "Boost" that Standard-bred poultry has ever had. The result is a happy verdict, not only proving beyond question that the finest quality bred birds are also the best general practical stock obtainable, but these trials have also brough back confidence to the hearts of every doubting breeder, that will henceforth remain unshaken.

We can ask no more of a hen, then, that she in her standard shape and pretty dress give ample returns in eggs for her cost and keep with interest included. But she has done far more than this, more than was expected or thought possible of her. Individually and in flocks, she has hit the high marks of production, besides qualifying herself capable and a reliable re-producer of the same qualities.

Yes, thanks to the Standard-bred hen, the poultry business is today sounder and safer than ever, that prospects were never better, or the hen more popular than right now.

H. P. S.

It is policy to exhibit your birds when and wherever you can, but don't-over-do-it, make it a point to show your stock as often as possible according to conditions and the results you wish to obtain. No show should be either too large or too small for you to consider, if your stock is right, then make the best and largest show within reach, at least show them for birds are not always at their best in feather and in condition.

While there is always a chance that some breeder has some better stock, take nothing for granted and make them prove it in real competition. Whether you win or loose the exhibition of your stock will

be to your advantage. The opportunityof seeing your stock side by side with that of the other exhibtors, should be of special advantage to every exhibitor, there birds can be compared under equal conditions which enables you to learn both the strong and weak points of your line. If you win, even if only locally it will be your start as a real fancier and breeder and your local reputation will be the foundation for your future efforts, while if you fail to win, you will be better prepared to come back next time with knowledge gained, with more assurance and with better birds that are better fitted.

While we do expect near perfect condition in exhibition birds, it is very seldom found and the honors most usually go to quality birds that are in as good condition as can be expected of them. When you enter, avoid one mistake commonly made —enter as many as you can, don't figure on how few you can show, but on how many, for the good ones you leave at home may be your best, and perhaps would have won for you had you had them there, while you take the chance of winning, go the limit and show all you believe worthy. It is always best to show two or more birds in each class for with every bird entered you double your chance to win. You best make one show right, than several only half right.

In exhibiting special attention should be given to detail for it is generally the small things that count and win the honors, so look well to condition and the many little things and the larger ones will be cared for through them. Condition simply means to have your stock fed-up and at their best in health, shape and feather, they should appear strong, active and gentle, they should be natural and free from fear by proper coop training.

In selecting consider well both shape and color and markings equally, the one alone ,no matter how good will not win for you, but the well-balanced specimen, the one that averages best in several sections is the one to win. Shape and color are now considered equal in value, but where a close race is run, shape is most likely to win. Head points are an important factor in exhibition stock, they usually make first appearance either good or bad, so look well to this section in selection, but never cut or alter a comb for the Judge will easily notice this and pass right on, take your chance with the combs as they grew.

In preparing birds for the show room much depends upon feed and handling a good variety of wholesome foods, with a few extras added are advisable. Much depends upon whether they are old or young birds, still with either a little meat is recommended, also some rich foods such as Oil-meal, Sun-flower seeds, etc., will add lustre to plumage.

But show your stock and as best you can, the result will be satisfactory and all to your advantage.

H. P. S.

Success is the result that we all strive for, or at least with ambition should, no matter what our line, it is the goal of honest effort, and demands of every one of us the best there is in our make-up, it demands the use of brain or of muscle, or of both. If we shoould reach success in the poultry business, we must study, learn, work and try, then keep trying. Success is possible to all, but to attain it we must fit ourselves for it and be worthy of it in every way for final success is well worth all that it costs in both time and labor and if this could be more fully appreciated, there would be more that would keep trying for it.

To be successful in this or any line requires the complete knowledge of all conditions pertaining to it, it requires you to build from the ground up, for the great and lasting results can only be attained by the master of all detail and all conditions. The poultrymen of today have the lessons of a glorious past to refer to with its possibilities well proven, he has the advantage to now learn from the costly experience of others, who by their labor, time and money fathomed the detail ahead of them.

The poultryman of today has fallen heir to a greatly improved line of substantial varieties that insure results up to his capabilities, with these advantages at his command, there is a systematic (as it were) opportunity for poultry production and for profit, it is up to him to measure up to his opportunities, up to him to make good. Success demands a master of conditions, a willing student and a willing worker.

Yes, success demands much of us all, but it is worth all it demands in any walk of life, and in any undertaking. Be ever vigilant, be ready to grasp your opportunity, work, and try to enter the first line of your chosen endeavor, and when you reach, throw a line and extend a helping hand to others.

H. P. S.

We ask this question more to please you, than to satisfy ourselves for we have hundreds of letters from breeders in every section commending "Everybodys Poultry Magazine." Still we are not fully satisfied with this, we wish to hear from every one of our breeders and readers so that we may know beyond doubt whether or not our efforts are meeting with universal approval.

While we hope that "Everybodys" finds a welcome wherever it goes, we like to have you tell us of this, also this would best show your interest in our work. The letters received have impressed us more than ever of the importance of poultry as a national asset and a national business, for the many without fear of overproduction, they show to us that interest is at its highest and that conditions are satisfying while all point with pride to the general confidence displayed in every nook and corner of this great country.

Poultry interests are spread over every square foot of this country, to a more or less extent, and there is not an editor, breeder or reader, who hasn't still something entirely new to learn. We can learn best by practice and by experiments and from one-another for there is no know-it-all in the poultry business for the game is too big and great with too many opportunities for any one to comprehend.

These are some of the reasons why we wish to know how we have pleased you, for we wish to live and to learn by your experience as well as by ours. With your confidence and help we will travel along, see the best we can find and hand it to everybody in "Everybodys." The more you will interest your-

self in "Everybodys" the more you will help to make this one the "Popular" magazine for all interests. We invite you all as correspondents, we want you with us earnestly for there is no limit to our ambition to have "Everybodys" greater and better and of real value to every home where poultry is being kept, or should be kept.

H. P. S.

Advertising is a commodity, a thing purchaseable, the same as merchandise or bonds, stocks, etc., and which always pays a good return on the investment, when properly made.

Advertising which is solicited and accepted with such an understanding always fulfills it's real and full mission. The seller, the purchaser and the medium which brings the two together by means of advertising, will all be better served by a clearly defined, inflexible standard of honesty.

The man who advertises dishonestly has his conscience to reckon with in addition to his loss of customers (as the truth will out). The man who is misled by dishonest advertising doubts the breeder and merchandiser, and joins hands with those who have suffered the same as he, condemning the whole business on the strength of one or more who have failed to respond to honest dealings required.

The Poultry Publication which is unwillingly made the medium for such an advertisement is discredited at times, through no fault of its own, but rather a lack on the part of the buyer to promptly notify the publishers of any dishonest action on the part of the advertiser. Much could be remedied, if when answering correspondence, the buyer would mention the publication in which he found the advertisement, thus acquainting the advertiser that he, the buyer, made his choice from a reputable magazine, and expected honest treatment.

Missouri has an honest advertising law which has just gone into effect and naturally a great many people everywhere will be curious to see how it works out. The idea, however, is not new. The better class of advertisers and publications have established standards which they have adhered to for years, on the good old principle that "honesty is the best policy"

J. T. H.

This is an old, old question, still one worth repeating often. Where poultry is kept, the growing of fruit is advisable and recommended, we like others have touched upon this question before and no doubt will again for the reason that the one goes hand-in-hand with the other and that the two crops can be produced on the same space at the one time, with advantage to each.

The growing of choice fruit and berries is a interesting study in itself, not quite as broad or interesting perhaps as is the proper growing of poultry, still as it is really an essential, as it affords shade and other conditions that are necessary, it is worthy of thorough consideration at all times. The tree or bush in the poultry yard bearing a crop of its own doubles the use and value of the land to the owner. The fowls will scratch and dig, cultivating and turning the soil, destroying the bugs, fertilize the land, all of which pertains to an increased crop of quality fruit.

It costs no more to raise good fruit, then it does to grow the inferior kind, fruit grown in the poultry yard usually is of the A. No. 1, quality. The best looking Barred Rocks as a flock that we have ever seen grown, had the run of a berry-patch, they roamed all day, passing low under the thorny branches, coming out as sleek and clean as if ironed-out with their plumage always clean and brilliant.

Any kind or variety of fruit that will grow in your climate, will thrive in your poultry yard. Apples, always a standard fruit and crop are number one in consideration, and particularly now as they have the early bearing varieties which are in great demand. The Wealthy and the Wolf-River are among the best, they are large red apples that bear at four years old when properly cultivated. There are trees here that in five years bore two bushels of fine fruit. Pears also a standard fruit with unlimited demand while peaches in soil adapted to them, with their early bearing qualities along with the demand, can also be considered as one of the best paying propositions.

Select the fruit and varieties best adapted to your section and soil and arrange to set both this fall and next spring. Berries that will do best with you should not be overlooked. Plan now for that which you hope for in fruit and berries, you will enjoy the home-grown products more than ever, and you will also enjoy the increased returns.

H. P. S.

Quite recently a well known poultryman one holding a responsible office, made the statement that "utility" and "fancy" could not be successfully combined—that the man breeding for eggs alone regardless of type or feather would be more successful in his line than the "dual" breeder: that is, the man producing with exhibition and utility fowls from the same flock and the same fowls. He also stated that this man would lose in the showroom to the ultra fancier breeding for exhibition alone regardless of egg production.

This seems to reflect the radical viewpoint of the subject held in common by commercial poultrymen and theorists based on lack of knowledge and experience.

This man should know better. When he was breeding exhibition fowls he was one of the worst offenders in disregarding egg production and breeding for feather alone. It was perfectly natural that those who are radical in one way will be equally radical in the opposite thought once they have experienced a change of heart. Both types are "Bigoted". They can see and understand nothing beyond the one set of thoughts relating to that side of the industry which they at the time are promoting.

Neither type of bigot is worth anything to the poultry business. Those who have pushed poultry breeding onward and upward, and who in the future will make every progressive step, are the steady, reasonable thinking "middle of the road" breeders who believe and are providing year by year that the work

"utility" means not egg production alone nor meat alone but a combination practical production of both together with the form and feathering described for the breed by our American Standard of Perfection.

Men of this class are steadily winning more honors in both lines year by year and it is only a question of time (and a very short time) when the radical, bigoted, one cylinder man who can see and understand that our place of poultry breeding, whether it be "utility" alone or "fancy" alone will be entirely eliminated by the progressive intelligent "be autility" breeders.

L. P. G.

THE VERDICT

The consensus of opinion of the reading public, of the poultrymen in general is favorable to "Everybodys." They tell us that is refreshing and delicious, complete in news, attractive in style, prompt in issue, rich, wholesome and practical in text and most efficient.

This All Has Been Our Aim

From the first to issue a magazine as broad and as liberal as it is possible to be, one of real worth to all poultry interests, rest assured that we highly appreciate the reception accorded to "Everybodys."

Our Future Plans

Are not fully matured, we will soon give them to you, there are plenty of good things in store for "Our Folks," plenty of them every month. The monthly articles written by

Prof. Harry R. Lewis

will all be articles of special feature, full of merit, practical and reliable. You all know

Charles D. Cleveland

A leader in all work pertaining to poultry. His experience as a judge and breeder and as manager of the Greatest Show on Earth, the Madison Square Garden New York Show, qualify him to supply articles of greatest worth to expert and the beginner alike. There is but one

Louis P. Graham

and he, besides being our art director, will supply monthly an illustrated article on the different varieties and breeds of Standard bred poultry, showing them in their correct outline, also illustrating their defects. Then there are "others" to interest you, including Mr. J. Harry Wolsieffer, Mrs. Irving F. Rice, Estelle E. Collier, H. V. Tormohlen, Frank F. Conway, J. C. Punderford, etc.

DON'T MISS

an issue; you can't afford to. Recommend "Everybodys" to your friends, talk it to those you meet, interest yourself in this work, for a greater industry and a greater general success. Now won't you help?

AN ESSAY ON EGGS

"An egg," explains an admirable essayist down in Kansas, "is composed of four parts—the shell, the yolk, the white and the price. The shell is very fragile, like one of the ten commandments, can be broken without an effort. The price is the biggest part of the egg and its greatest protection. The price alone has saved millions of young eggs from being boiled and eaten. Eggs are very delicate and spoil very quickly. When an egg spoils it puts its whole heart into the performance. One can tell a spoiled egg as far as it can be seen, and with one's eyes shut at that, if the wind is in the right direction. There was a time when everyone ate fresh eggs in summer and went without in winter. Nowadays, however, business methods have led men to save all the fresh eggs in summer and store them until winter, when they have acquired a rich russet flavor.

MR. D. F. PALMER

Mr. D. F. Palmer, Yorkville, Ill., is the senior member of the firm of D. F. Palmer & Son, breeders of Barred Plymouth Rocks. Mr. Palmer has proven himself a most successful breeder and writer, and we are particularly pleased to refer to him as one of the reliable "Stand-Bys" of the fancy.

MANHOOD

Life's best prizes are won, not by adroitness or sharpness, not by skill or strength, but by that grandest thing known on earth—manhood. Honorable, educated, active manhood is to rule the world.

Always there have been bad men, corrupted, degraded, but sharp and cunning, who have made great gains by great frauds, or crafty swindling, and have held some sort of position in the world in spite of their want of character, for there are parasites and money worshippers who honor and applaud the man of money without caring to know how he came by his possessions.

But These Are the Exceptions

The true man is the thing most prized by the world. True manhood is the wisest, sharpest, strongest, most clear sighted, far-sighted contestant in the battlefield of life. Manhood carries the sharpest sword, gains the truest success and wears the brightest crown. No one is, or can be, the best preacher, the best lawyer, the best physician, or the best business man, who is not truly, grandly, gloriously and unselfishly a man.

If you would climb to the highest places, carry off the richest prizes, get the most enjoyment out of life, and have the sublimest old age, you must conquer the base elements of nature, you must have every atom of the dross of dishonesty squeezed, hammered, burned out, if necessary.

You must come as sound as 24-karat gold, as true as best steel. You must prove yourself as reliable as nature, as incorruptible as sunlight, as pure and sweet in your personality as the breezes of heaven. You must scorn all meanness, loathe all false pretenses, be afraid of every kind of dishonesty and hate a lie as you would hate the devil himself. You must determine stoutly to be what you would appear.

There is a premium on men like that. The great world, disgusted with frauds and pretenders and shams of all kinds, will know such a man as soon as he appears. It will prize him, honor him, reward him, make him famous and render him immortal.

O. F. J.

TURKEY NATIONAL BIRD

Among the aboriginal inhabitants of America the turkey was a favorite fowl. It had its habitats over all the section where grew its favorite food, Indian Corn.

When Cortez, in 1519, first reached the realms of the Aztecs, Montezuma entertained him with royal splendor, and among the delicious viands set before the Spaniards was roasted turkey.

It was found that the Aztecs had domesticated the fowl to quite an extent and that it was also plentiful in its wild state. North of the Rio Grande the bird was equally well known, and the adventurous Coronado found it among the cliff-dwelling Indians, and other tribes he met on his expedition through what is now Texas, Arizona and New Mexico.

The wild turkey of America is, without doubt, the progenitor of all kinds of turkeys the world over. Ornithologists in general accept the view that all turkeys have descended from the three forms known today as the North American, the Mexican and the Honduras (Ocellate) varieties.

The fowl was taken over by the hand of man, first to Spain, then to

other Mediterranean countries, to Northern Europe, to the far East, until he is now well-nigh omnipresent.

AUGUST

A few of the prominent events and happenings during the month of August in the past are recorded below:

August—

1, 1799—Francis S. Key, comcomposer of "Star-Spangled Banner, born.
2, 1920—Protonuclein Special Powder introduced.
3, 1848—First Women's Rights Convention.
4, 1831—Chicago laid out.
5, 1857—The Atlantic cable commenced.
6, 1890—First execution by electricity New York.
7, 1789—War and Navy Departments organized.
8, 1829—First trip of a locomotive.
9, 1819—Wm. Morton, discoverer of ether as an anesthetic, born.
10, 1846—Smithsonian Institute established.
11, 1807—The "Clarement" sailed up the Hudson River.
12. 1830—First American steam railroad completed.
13, 1898—Manila surrenders.
14, 1892—Raging cholera epidemic in Hamburg.
15, 1771—Sir Walter Scott born.
16, 1893—Charcot (Charcot's disease) died.
17, 1786—Death of Frederick the Great.
18, 1857—Virginia Dare, first white, child born in Va.
19, 1812—Battle between Constitution and Guerriere.
20, 1858—First Atlantic Cable message.
21, 1453—First Olympic games at Elis, Greece, B. C.
22, 1851—Yacht "America" wins great race.
23, 1821—Mexico becomes independent.
24, 1814—Capitol at Washington burned.
26, 1783—Sam C. Reid, designer of U. S. Flag, born.
26, 1743—LaVoisier famous chemist, born.
27, 1783—First balloon ascension in Paris.
28, 1749—Goethe, famous poet, born.
29, 1877—Brigham Young, of the Mormon church, died.
30, 1866—Doctrine of Christian Science promulgated by Mrs. Eddy.
31, 1821—Helmholtz, inventor of ophthalmoscope, born.

A GREAT CORPORATION

New York City as a municipal corporation carries on a business of about $250,000,000 a year. This expenditure exceeds that of the national government, excluding outlay for the military and postoffice departments.

The city has about 90,000 employes in more than 150 independent departments and offices.

During the last eight years, New York has expended $1,750,000,000, of which $1,250,000,000 was raised by taxation, and $500,000,000 was borrowed.

"FAIR PLAY TO ALL"

West Springfield, Mass.,
July 5, 1915.

Everybodys Poultry Magazine Co.,
Hanover, Penna.

Gentlemen:—

It has just been my pleasure to read the July number of Everybodys.

You will note particularly the word "pleasure," for it very adequately expresses the sensation.

Incidentally, I read thirteen other poultry journals, but not always with a sense of pleasure, because of the fact that the various editors seem to feel that their readers are interested in their personal spites, differences, jealousies, or any other term by which you may please to call the mud-slinging they resort to month after month, and if your editorials in this number are to be accepted as a guarantee of your future policy, then you deserve the support of every thinking member of the poultry fraternity.

Now, I am a new one in "the game," in fact I am not yet really "in," as I am still drawing a salary from another line. What I don't know will fill the proverbial "book." Right here comes the point I desire to make. I subscribed to these periodicals for the purpose of accumulating and classifying all the information possible, or at least desirable, and I am quite certain that much more real information might be found in many of our magazines if the editors would devote less time and space to "knocking" their neighbors and give the people who make their circulation possible (where would the poultry paper be without circulation?) more of what they really want and have a right to expect.

No doubt this is a strong position for an amateur to take, but it takes an amateur sometimes to bring the profession to its senses. I have been disgusted with the situation, and can say that such practices, continually indulged in, would ruin the business—and the press connected with it—which I have followed for the last twenty-eight years.

It is needless to say that the papers approaching nearest to the ideal set in your editorial will get my renewals. I trust you may realize that ideal.

Yours truly,
F. H. BELDEN, JR.

A BEAUTIFUL COUNTRYSIDE

Go through the country and contrast the different countryside. One community will show every evidence of thrift, neatness, refinement, beauty in farmsteads. In other sections there is the reverse, fences, weedy, machinery dilapidated under trees, buildings often out of repair and frequently unpainted, lawns unkempt, no shrubs or flowers to beautify. The time has come for redirection of our ideas regarding community improvement. Not only individuals but communities must assist in enriching country life. County life enrichment consists not altogether in raising bigger crops and selling these bigger crops at bigger prices. Country life enrichment, meaning improving the ideals of the people. Much of this enrichment is the result, not of more money, but of more intelligent thinking, intelligent planning, intelligent doing. The farm kept free from weeds, its fences in repair, its buildings painted, its lawns neat and tasty and embellished with flowers and shrubs, is a more productive farm, and the people living on it better citizens, better beings. Our lives are ordered largely by our sentiments and emotions. If these are high, efficiency, happiness and culture result. If the plane of our lives is low, then ugliness, discomfort and low ideas, will prevail.

NEW YORK STATE FAIR

Syracuse, N. Y., Sept. 13th-18th

The seventy-fifth annual premium list of the New York State Fair has just been received and it is a list of unusual merit with so much of interest to the poultrymen, we give it this special mention.

Superintendent W. H. Manning, with his very able assistants, has issued a list that should insure an entry of 10,000 birds. The cash prizes are $3, $2 and $1, in the single classes and in pens, $5, $3 and $2. The real feature of the list is found in its special cash prizes, for in every class we find from $10 to $35 offered in from one to three prizes for displays. Then there are also several cups to be competed for.

With their great new poultry building, the best of cooping and with 21 of the best known judges engaged to place the awards, this surely should be one of the greatest and best. The enrties close August 25th, write to Secretary Stanton C. Shaver, Syracuse, N. Y., for the list today, enter your birds and attend this show. We also understand that a meeting of the New York State members of the A. P. A. will hold a meeting on Wednesday or Thursday in the show building.

THE PHILADELPHIA SHOW

December 14th to 18th, 1915

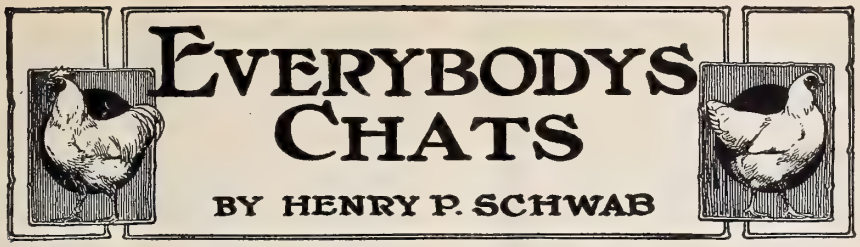
Philadelphia's 10th Anniversary show promises to excel all others of the past in size and in favor. This has always been one of the popular shows and a favorite with all. The best of judges will be employed and a rare list of specials will be offered. Write Mr. F. E. Gilbert, Sec'y, Hale Building, Philadelphia, for information.

We call the attention of our readers to the advertisement of the R. T. French Co., Dept. E, Rochester, N. Y., manufacturers of French Poultry Mustard.

Thousands of poultrymen recommend this preparation and with Mr. C. F. Rankin, owner of the Schenley Heights Poultry Farm, are only to glad to recommend it.

This company have prepared a very interesting booklet, giving Mr. Ralph Allen's experiments and other articles on mustard and its relation to poultry and increased egg production. This is free for the asking.

J. T. N.



Rejoice! ye fields, rejoice! and wave with gold,
When August round her precious gifts is flinging;
Lo! the crushed wain is slowly homeward rolled:
The sunburnt reapers jocund lays are singing.

* * *

The question of the day—How did you like the July issue of "Everybodys?"

There may have been a better or handsomer Poultry Paper issued, "BUT" where or when?

* * *

You surely won't blame us for geting a little enthusiastic over that issue, for it kept us pretty busy answering congratulations, from all sides.

* * *

Our July cover reflects particular credit upon our Artist Louis P. Graham. Mr. Graham has more good things in store for the readers of "Everybodys". Don't miss an issue. Tell your friends.

* * *

If you haven't entered "Everybodys Prize Contest" you had best do so now, this contest is open to all alike. By a little extra effort you can not only earn good pay but also have a chance to win one of our "Grand Prizes" . Surely they are worth trying for. Start NOW.

* * *

We have just been informed that Mr. M. F. Delano, the owner of Owens Farms is the Daddy of a Son. We wish you "Good Luck" Del with the hope that "Maurice F. Jr., will faithfully follow in the footsteps of his Dad.

* * *

The stock that you intend to exhibit this fall and winter requires attention Now.

* * *

We still have a few hens to hatch. June, July and August are the months to raise Barred Rocks of color.

* * *

The breeders we have visited this season have more chicks than ever, they are prepared for the demand to come, and come it will.

* * *

Quality will again have the call, mark this, it was never before seen to greater advantage. This will also be a White Wyandotte year, mark this also.

* * *

The experience gained this year should be a lesson for the future, they are yours to profit by.

Look to the value received before you do to costs. Breeders who have done this have proven that right methods of advertising, buying and selling and systematizing enable them to do business at a profit.

* * *

Courtesy will secure eternal good will.

* * *

Honest advertising thunders the truth about you and your stock.

* * *

Your ad in "Everybodys" will give you results, if there are results to be had. Try it.

* * *

Let every one be judged by what they are and do, and not by guesswork or suspicion.

* * *

Look out for the fellow who hollers —"Stop Thief" he will bear watching, nuf-said.

* * *

Joy hides behind the eyes
Of sorrow in her darkest hours,
As underneath the snow there lies
The promise of a thousand flowers.

* * *

"Pa, a man wife's is his better half, isn't she?"

"We are told so, my son."

"Then if a man marries twice there isn't anything left of him, is there?"

* * *

Am glad to know that so many agree with our opinions of "Luck." One sends us this—Luck whines; labor whistles. Luck believes in chance; labor believes in elbow grease.

* * *

We note with interest that several of the Poultry papers are fixing up at this time. Wonder why?

* * *

Bear in mind the New York State Fair. This is one of the prominent events of the season. Their poultry building is the grandest in this country, their premiums are most liberal and a rare lot of special prizes are also offered. Note ad in this issue.

* * *

The Allentown Fair is also a feature show, one worthy of every consideration. They also have a beautiful building with the poultry department in charge of Mr. Theo. Wittman. Note the ad in this issue.

* * *

The Tri-State Fair held at Trenton, N. J. also is one of the big fairs of the east. The poultry department here is an unusual feature. You don't want to miss this. Supt Rogers is a "Flea" and promises a session there during the Fair.

* * *

According to the New York experts, every fourth passenger in a street car is a germ carrier. The remedy would seem to be simple; exclude every fourth passenger.

* * *

Our new "Department of the Great West" should be one of interest to our readers particularly at this time with the A. P. A. meeting to be held in the west, and also on account of the Universal Poultry Show at San Francisco. Mrs Estelle E. Collier promises us live news and notes of interest. Keep posted by reading "Everybodys."

* * *

Every subscriber can aid in making "Everybodys" better and of greater value to the industry. Won't you all help? Please.

* * *

An officer was showing an old lady over the battleship. "This," said he, pointing to an inscribed plate on the deck, "is where our gallant captain fell."

"No wonder," replied the old lady, "I nearly slipped on it myself."

* * *

Note that we have contracted to issue 45,000 or more copies monthly, we want to make those "More." There are at least 100,000 interested breeders who should suscribe for "Everybodys" right now, it will be to their advantage. When you talk chicken, also talk "Everybodys."

* * *

President E. B. Thompson of the A. P. A. is urging that a special effort be made to secure more members for the A. P. A. Let us hope that his

REGAL SUMMER SALE

In order to make room for my large flock of rapidly growing chicks I am offering for sale 500 selected breeders at remarkably low prices. Send for free sale list giving description and prices; also 20-page catalogue. Eggs from prize matings, $2.50 per 15, $4.50 per 30, $6.00 per 45, $12.00 per 100.

Regal Cockerels and Pullets

This season I have over 1,000 early chicks, the best I ever owned. If you want to make a winning in your State Fair let me quote you prices.

JOHN S. MARTIN : : Box D : : PORT DOVER, Canada

RILEY'S BARRED PLYMOUTH ROCKS

I have some bargains in yearling Hens and Cocks, either mating, of my choicest breeders the past season.
Also some wonderful youngsters ready to win your early show.

HENRY D. RILEY

Box C. Strafford, Chester County, Pa.

call will be heeded and that every member will make it a point to secure one or more members before the November meeting. President Thompson's administration has made history, and now as it draws to a close let's help to make it one of record membership also.

* * *

A national crisis may serve us well if it wipes out party lines, creeds and hyphens.

* * *

Loyalty promoted harmony. The ultimate success of all of us depends upon our loyalty.

* * *

You need "Everybodys" if you need a poultry magazine.

* * *

Officer (to scared soldier)—What do you mean by running away? Didn't you hear the general's orders to "do or die?"

Scared Soldier—"Do or die"? I thought he said "Do a guy!"

* * *

Of course your neighbor has his faults, but you should have enough self control not to mention them.

* * *

It is pleasing to note the increased interest in Bantams. Start the little fellows with bantams, let them have their pets to care for, it helps to make home more real with some cares of their own.

* * *

Boost and the world boosts with you,
Knock and your on the shelf;
For the world gets sick of the one who'll kick,
And wishes he'd kick himself.
Boost and the world boosts with you
Boost when it starts to rain.
If you happen to fall, don't lie there and bawl,
But get up and boost again.

* * *

News report says—A Pennsylvania grave digger committed suicide because business was bad. He should have moved to Europe.

* * *

Wild ducks are said to be flying north, but there are a lot of them that stay right in this section the year round.

* * *

In this issue we have an article written by Mr. John A. Gough, that you should read. The Houdan is coming into its own and we hope to see it again as one of the most popular varieties. It has merit sure.

* * *

Mother—"Why didn't you take your bath?"

Tommy—"I thought there might be some mines in the water."

* * *

No matter how full of wickedness the world is, you can now get nice slices of watermelon at all eating places.

* * *

A woman asked our German druggist for some talcum powder. "Do you want it scented?" he asked. "No," she replied, "I'll take it right along with me."

Wonder if our readers would be interested in a Horticultural Department? We are now considering this proposition.

* * *

This month we expect the first copy of the Canadian Poultry Journal to be issued at Hamilton, Ont., by Mr. Robert H. Essex. We will have a Clubbing arrangement for you to consider soon.

Members of the Poultry Associations should take advantage of our friends as subscribers, and you surely will want one of these beautiful cups to offer at your show. Now get busy and secure one of these cups, do this for your association as well as for the increased interest it will create in better poultry in your section. Either directly or indirectly this will benefit all.

Judges At the Universal Poultry Shows

They Come From Twenty Two States and Proviences and Represent All Sections of the United States and Canada--An Interesting Program Being Prepared For the Meeting of the American Poultry Association--Special Arrangements With Ex-Companies On Car Lot Shipments.

The interest in the Universal Poultry Show of the Panama-Pacific International Exposition is greatly on the increase. Especially does this seem so since the American Poultry Association voted to hold its annual convention in San Francisco on the same date. One of the greatest poultry shows that has ever been held in the business program and educational features of the American Poultry Association, the lectures and demonstrations on practical poultry subjects, and one of the most wonderful International Expositions that has ever been held in the world should create still greater interest on the part of all poultrymen whether they be fancy or utility breeders.

The list of judges is one which always interests prospective exhibitors. In selecting the judges for this great show, an effort has been made to distribute them over as large an area as possible. Twenty-two states and from the list simply because of the exprovinces and all sections of the United States and Canada have been given recognition. There are a number of other good judges that the Exposition would have been pleased to place on the list, but considering the fact that those already selected will be brought to the show at an expense of about $3,000, it is easy to see that the number had to be limited, and several whom the exposition would like to have employed have had to be left from the last simply because of the expense incurred. Those engaged are:

Brach, E. C., Mo.
Card, W. H., Conn.
Coats, W. H., Vancouver, B. C.
Collier, H. H., Wash.
Currier, A. H., Calif.
Dixon, Elmer, Ore.
Ellison, W. C., N. Y.
Forbes, Mrs. Florence, Ala.
Godacre, A. G., Calif.
Graham, Prof. W. R., Canada.
Hewes, Theodore, Ind.
Hicks, Reese V., N. J.
Hobbs, V. O., Mo.
Hinds, Chas. G., Cali.
Holden, Geo. D., Min.
McClave, Charles, Ohio.
McCord, O. L., Ill.
Palmer, Russell F., Neb.
Pickett, H. A., Ind.
Rhodes, Chas. H., Kan.
Roberts, E. G., Wis.
Rice, Irving, N. Y.
Russell, W. S., Iowa.
Shove, Daniel P., Mass.
Tucker, James, Mich.
Van Winkle, C. P., Texas.
Wittman, Theo., Penn.

S. T. Campbell and E. B. Thompson, the Secretary and President of the American Poultry Asociation are arranging an interesting program for their annual convention. The indications are that the Association members will have all they could desire in the way of beneficial and important business matters and discussions and lectures that will be entertaining and profitable to them. Lyman C. Dice and the members of the California Branch and California poultrymen in general are preparing to see that all visiting members are properly entertained and shown some of the most interesting features of the Exposition, of San Francisco and California.

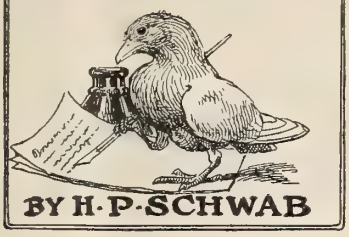
NOTES and COMMENTS



BY H·P·SCHWAB

President-elect E. E. Richards of the A. P. A. in his letter of acceptance leaves nothing more to be desired or in fact to be said. It is quite evident that we have elected "The Right Man" and that we can look for progress with a larger and stronger association than ever before. Organization is the road to success.

But the A. P. A. to be a truly great association, must keep away from the dictatorship, it must be great and broad in policy and in mind, it must be above the reach of the wail of the suspicious and narrow-minded. It must demand facts and not accept the distorted rumblings of a weak mind. To be great one must of necessity be generous. The A. P. A. can and will be great and just, if we all do our utmost as men.

* * *

In our last we neglected to mention that Mr. M. R. Jacobus had been elected President of the American Campine Club succeeding Mr. Frank E. Hering. Fortunate is the club that has two such men as interested members. Mr. Jacobus was one of the first, if not the very first to import and to breed Campines in this country, he has ever been their champion and their success here and what this breed is today is very largely due to his interest in them and his sucessful work. We do congratulate the Campine breeders on Mr. Jacobus's election.

* * *

We lately spent a day at the home of Mr. E. B. Thompson at Amenia, N. Y., and will in our next mention our views of his "Ringlets" and what was seen there. Mr. Thompson like the rest of us sees a good season ahead and he has prepared for it by raising something over 5000 young that look promising at this time. His special sale season is still on and he has the quality to supply to all that wish it. This has been the greatest season of his career, having sold more stock and eggs than ever before.

* * *

The 1915 American Barred Plymouth Rock Club catalogue has been received and we feel that we owe to Secretary H. D. Riley, more than mere congratulations for he has surely issued one of the very best club books we have ever seen. It is a book of special class that reflects much credit on all members of the club and breeders alike. It has been truly stated that the Barred Rocks are now more popular than ever, true it is, they are better, better layers, better growers and improved in every way. The future is surely bright for them.

* * *

Among other 1915 catalogues of interest received is the American Houdan Club Year Book for 1915. The officers for this year are—President Mr. J. A. Underwood, Penn Yan, N. Y., Mr. John A. Gough, Secretary, New Haven, Conn. This book is full of selected articles that will interest lovers of the Houdans as well as those who should breed this variety.

SEPTEMBER FEATURE

LOOK FOR THIS—

Estelle E. Collier's

Great article on "The Possibilities in Poultry Breeding." A sound, practical essay everyone should read. Also

"A BASKET OF EGGS"

By Mr. Willard C. Thompson. You have read some of his articles before in "Everybodys," now read this one and others to follow; there are many more good things to come in

"EVERYBODYS"

* * *

The American Cornish Club catalogue for 1915 is also at hand. The first thing we looked for in this was to see who was secretary and were glad to note that Mr. John W. Ward, Jr., Pennington, N. J., was still there. Mr Ward's several years of successful work in breeding and boosting this variety is well known, and I do not believe that it is stretching a point when I say that—The popularity of the Cornish in this country today is mainly due to his work and efforts. He has proven himself a good champion of a good variety.

* * *

All the Poultry Press has sung the praise of the Light Brahma Club Catalogue for 1915. This is another book of special value, and here again we find a secretary who has more than made good. To Mr. Harvey C. Wood, Bound Brook, N. J., every credit is due for his work for this grand old and reliable variety. There are ten times the number of Brahmas in this country today, that there was ten years ago, and if Mr. Wood lives, there will again be ten times the number ten years hence, you see if they don't.

The catalogue of Mr. M. S. Barker, Thorntown, Ind., is received. In our July issue was shown a full page cut of his Chicago winning Black Langshans. Breeders interested in Langshans should have this catalogue for it is full of good things of this noble variety.

* * *

The Million Egg Farm School of Poultry Practice deserves to become a most popular institution. Located as it is at the Rancocas Farms, Browns Mills, N. J., and in charge of Mr. Reese V. Hicks, as Principal and Mr. M. I. Chapman as assistant every opportunity is offered to learn in a most practical way the brooding, and raising of poultry. We lately had the pleasure to visit these farms and noted their completeness as well as the opportunity there offered to those who wished by practical experience to obtain knowledge.

Their booklet is mailed free and we would advise our readers seeking knowledge and desiring to make poultry a life's work to investigate fully what this school is offering you.

* * *

The Columbian Wyandottes in Secretary Ralph Woodward, Grafton, Mass., also have found a man personally interested in the variety who is sure to make them more popular than ever, Mr. Woodward is doing good club work and believe me he is also breeding some good ones.

* * *

We highly appreciate the poultry books and bulletins issued by the Missouri State Experiment Station. The success of this station along with their practical dispensing of knowledge gained through their book tends for better poultry and better conditions in general.

Summer Care In the Poultry Yard

The Summer Care of Poultry Is a Subject of So Little Importance To Many New Poultry Keepers, That They Are Very Apt To Neglect It. It Seems As Though the Hot, Scorching Days Fairly Wilts the Ambition of the Otherwise Wide-Awake Person, and Much is "Put Off Until Tomorrow That Should Be Done Today."--By Michael K. Boyer.

THE summer care of poultry is a subject of so little importance to many new poultry keepers, that they are very apt to neglect it. It seems as though the hot, scorching days fairly wilts the ambition of the otherwise wide-awake person, and much is "put off until tomorrow that should have been done today."

Now it is just as important that the fowls feel comfortable in summer as it is aimed to have them in Winter.

Not only should they be regularly fed and watered, but partial shade should be provided the runs, for the hot suns are depressing on the stock.

All foods of a heating nature—carbonaceous material—should be cut down in quanity, using merely enough to balance the ration.

The houses should be freely ventilated at night—in fact, the stock should have open fronts to the houses that they may get the full benefit of the pure, fresh air.

Not only is it necessary that fresh water be given, but care should be taken that the drinking vesels are kept in the coolest spot possible.

All this advice, to a veteran, is "an old story", but to the new aspirant—and there are many of them each year—it is valuable information. The importance of these small matters may not be apparent at first, but the longer one is engaged in poultry culture, the more does he see the necessity of strictly living up to these rules.

Especially are the months of July and August trying to the ardor of the poultry keeper. The hot suns make work a burden; the louse question calls for heroic action; the rusty look of the fowls about going into molt is an eye-sore; the egg crop is noted for its limitations; and the market price is almost discouraging. Are you subject to the "blues"? That is the time when you are apt to get them.

But the enthusiastic, plucky, willing worker will plod along knowing that the season will be here when the stock will look better, will do better, and when the prices for eggs and poultry will be a more tempting figure.

Green food is another important item. Short,tender grass, lettuce and radish leaves are not only relished, but the very best kind of greens to give and of course, the best methods is a range over a good pasture, poultrymen do not always have that advantage to give their fowls.

There is more or less dry weather during the summer, and the runs not infrequently become baked, and in heavy soils more or less filthy. The man who has the best interests of his stock at heart, will once a week use a hand plow in such yards and stir up the soil so as to make it loose and fresh. If he does this at night, the next morning the fowls will get to work, scratching, hunting worms, and stirring up things generally. It is wonderful how much they find in this turned up soil that furnishes them both amusement and food.

It should be the rule that nothing is thrown in the poultry runs that will not be eaten up quickly by the fowls. To make the runs a dumping place for slop, soon furnishes the stock with a lot of sour, tainted stuff that is sure to create sickness. We never believed in feeding sour slop to our pigs, and certainly would not to our poultry.

After breeding season, the wise poultrymen remove the male birds from the flocks. The eggs will keep much longer if not fertilized, and the hens will be able to shed their feathers better if not harassed by the males. I believe in separating the sexes in July and not remating before the first of the following year. It means stronger, better and more vigorous stock.

Poultry that is well kept during the summer, will be in good condition for the winter work. Broody hens will be more or less frequent during the heated term, and here I wish to caution beginners about using harsh methods in breaking them up of this broodishness. This instinct,I believe, is nature's provision for giving rest to the hen, and the most humane methods should be employed to curtail this period. A good plan is to put all the broodies in a separate run and house in which there are no nests. Another plan is to place each bird in a separate cage. A week generally changes the hen's ideas, and she is ready to get down to work again.

One evening at feeding time we noticed a pullet having a violent spell of coughing, after which she breathed very heavily. Upon examination it was discovered that the throat was irritated, and the crop full of indigested food. Placing her in a separate coop we gave the fowl a teaspoonful of glycerine, to which we added three drops of a family liniment. The next morning, she was all right again, and never after showed similar symptoms of ailment.

Two of our Brahma pullets got too fat for us, and being yarded with a vigorous cockerel, they eventually broke down behind, assuming very much of the duck shape while standing up. When fed grain they were compelled to sit down to eat it. Yet with all that trouble they kept up a remarkable laying. Finally they became broody, and we gave each a sitting of eggs. To our surprise, after bringing out a hatch, they reduced so in weight that the "breakdown" appearance had left them entirely. This might be called a "rest cure."

Two of the cockerels got into a tussel, and both being strong, vigorous fellows, there was a lively time until we appeared upon the scene. When we did, one of the birds had his comb and wattles badly torn. We at once washed off the blood, using warm water, and then heavily coated every part of the sores with carbolated vaseline. In addition we gave a teaspoonful of whiskey water—one fourth whiskey and three fourths water. It saved the bird from catching cold, and the wounds healed nicely.

There used to be a theory that hens without the attention of a male bird, would lay just as well and not so apt to become broody, as those mated. Our records show they will lay just as many eggs alone, as if mated, and that unmated flocks are not broody-proof by any means. In a flock of unmated pullets, every one becomes broody before one of the mated flock showed any signs in that direction.

It was once thought that hens would become broody before pullets, and furthermore, that overfat inclined hens to broodiness. Both these theories have ever since been exploded. Every year, on the farm of the writer, the pullets are the first to

show signs of broodiness (evidently on account of their early and heavy laying) and the very fat hens (the older they grow the more they are apt to get too fat) are the last to think of raising a family.

The idea of pedigreeing poultry, and knowing the history of each bird bred from, originated in the fertile brain of the Honorable Isaac K. Felch. We have now in our possession cards used by Mr. Felch and his brother Henry, which gives the history of each bird sold, and telling all worth knowing of the ancestors. From this, with the introduction of the trap nest, came the advertising of egg records rather than score cards, and with the advent of this change in poultry breeding, the stock not only became more hardy, but their utility qualities became more apparent.

About ten years ago, a man by the name of Silberstein, living in Framingham, Massachusetts, pedigreed his Light Brahmas. He invented a trap nest so that he would be able to tell the exact number of eggs each individual hen laid in a year, and also what hen gave the best fertile eggs, and which ones did not.

This seemed like a fairy tale, but Mr. Silberstein was so emphatic in his declaration that he could tell just what hens would do, that we secured 28 eggs from him. Five were laid by female No. 40; four by No. 48; three by No. 93; three by No. 14; four by No. 21; six by No. 95; three by No. 45. Along with the eggs came the pedigrees which informed us that pullet No. 40 was mated to a cockerel that scored 92, and weighed 12 1-2 pounds. The pullet was hatched May 17, 1897, and weighed at the time of the shipment of eggs was made, seven pounds and two ounces. She began laying November 19,1897, and laid to that date (April 30) 119 eggs; average weight of each egg in grains, 860. The pullet scored 90. The pullet's dam had an egg record of 177, and weighed 6 1-2 pounds. The pullets sire weighed 10 3-4 pounds. The cockerel's dam laid 171 eggs, and weighed 6 pounds, 2 ounces. The cockerel's sire weighed 10 3-4 ounces.

Pullet No. 40 laid six eggs in November; 14 in December; 22 in January; 22 in February; 30 in March; and 25 in April. And so on the record went of others.

The eggs were set—thirteen under a White Wyandotte pullet, and fifteen under a Brahma hen. The pullet hatched every egg. The Brahma set a week and then left the nest. She was replaced by a Plymouth Rock hen, and she gave up in another week. Then we placed the eggs in an incubator we had running at the time,and kept there until they began to pip, when we handed them over to the White Wyandotte pullet to finish which she did in fine style. Every egg was fertile, and all but two hatched, they dying in the shell.

The work of Silberstein practically paved the way for the success of the trap nest, and today the best utility breeders of the country would no sooner think of abolishing the trap nest than they would the incubator for market quality.

WHY YOU SHOULD ATTEND THE A. P. A. MEETING IN SAN FRANCISCO

(By Fank E. Hering)

This convention will be the fortieth annual meeting of the association. More than a generation, as the age of man is reckoned, has passed since the poultry raisers of this country, convinced of the value of mutual consultation and friendly co-operation, formed this organization for benefitting and extending their business. The poultrymen active at that time have doubtless all retired from business and many of them passed from earth. The prominent members of the association at present were mostly in early childhood. Some, indeed were not born, at the inception of the organization; but all are inheritors of the knowledge and experience which year after year has been formulated and expressed at the annual meetings.

One reason then, why all should attend is that they may not only receive, but assist in passing on, the benefits of their combined individual experience during the past year.

This convention will be notable as being the second opportunity for poultrymen west of the Rocky Mountains to attend such a gathering of fellow fanciers and breeders in their own immediate section—the previous occasion was in 1892. The indications are that they will improve the present opportunity and be out in force to display their interest and enterprise. They will, in all probability, be able to give certain lessons in progress to their more conservative brethren of the East.

The provisions made for the exhibition in connection with the convention surpass anything in the past. A special building has been reserved, and arrangements will be perfected for the care of 10,000 specimens of high-bred poultry. Some of the states and Canadian provinces will be officially represented by exhibits sent at public expense. In some cases state or provincial associations are assisting exhibitors. The leading breeders of the country are preparing to exhibit independently. The result of all these efforts will doubtless furnish the most complete exhibition ever brought together. It will indeed be international. Even the warring nations of Europe—so we are informed—are to be represented by their most distinguished poultrymen.

It will be one of the first large competitive exhibitions in which the 1915 Standard of Perfection will be the basis for making awards. Of course, its success in this line will depend upon the number and character of the exhibits. Hence, there is a forceful reason why the breeders of pure-blooded fowls of high grade should attend and bring the best products of their skill. They can make it a show that will reflect great credit upon themselves, and cause it to result in immense benefit to the poultry industry in general. Thus, this fortieth meeting of the American Poultry Association may well mark an era of advancement and become the means of improvement in many varieties and breeds throughout the country.

The twenty-seven judges who will make the awards are among the best to be had in America. The prizes offered are liberal and experience has demonstrated that the premium ribbons in former exhibitions have been valuable certificates of excellence. Such certificates have, in the past, become the foundation for the success and prominence of many breeders. They are the best advertisement—an accepted guaranty of the character of the stock.

The reasons are just as cogent for the presence of the small breeder of carefully selected stock as for the more extensive one. His chance for gaining a prize is just as good, and the premium ribbons may be worth even more to him in building up his trade.

The exposition will also present the latest devices for the breeding and care of poultry. In this matter it will be as valuable to the amateur as to the professional. He will find gathered together the results of the study ingenuity and experiments of breeders all over the land. He will be able in a few hours to gather the information as to methods and appliances which otherwise he would need to travel the entire country to obtain.

The convention itself will be an argument for attendance. Its reports, resolutions and discussions will be interesting and enlightening. In face to face colloquy, with question and reply, many knotty problems may be solved and obscure points illuminated. Suggestions born of actual experience may become useful guides not only for the individual breeder, but for the conduct of state and local associations.

On a similar line with the formal discussions in the convention sessions, but with a broader field and in a more familiar intercourse, the different breeders will have opportunity for private consultations and comparison of experiences. Such meetings are always valuable. It does people good to get together and exchange views, even when their interests are diverse. How much more when they have many things in common. Instead of being ruthless competitors, they become generous rivals. Though they may be promoters of different birds and strains, and each interested primarily in the success of his own, their comparison of views and experiences develops mutual understanding and sympathies, and they become better poultrymen, interested in the upbuilding of a great and common industry.

All of these considerations, financial, education and social, present cogent reasons why everyone interested in poultry should, as exhibitor or visitor, or both, attend the meeting of the American Poultry Association at the Panama-Pacific Exposition next November in San Francisco.

Orpington Breeders

READ THIS--It Will Interest You

I had 500 Black and Buff Orpingtons last fall from which a leading poultry judge selected and mated my very best birds. He mated 4 pens, one each of Pullets and Hens in both Blacks and Buffs, 20 females to each Pen, placing 3 Cockerels in the Pens of Hens and 3 Cocks with the Pullets. These birds have won Laurels at Madison Square Garden, New York. Also at many other leading shows. All these 4 Pens will be sold complete, just as mated for $100 each Pen. No pairs will be broken. Here is your opportunity.

Single Comb White Leghorns

I also have 300 Yearling S. C. White Leghorn Hens at $1.00 each; also 50 Cocks and Cockerels, one and two year-old at $2.00 each. All D. W. Young Strain. Send for catalogue and mating list and note verifications of above. Address,

Mr L. O. Kettering, Prop.
Mr. J. W. McGinnis, Mgr.

SANDY LICK POULTRY FARM
966 Liberty Street, Pittsburg, Pa.

THE frequent showers of the past few weeks has made us thankful that we have no small chicks, but that ours arrived during the extremely dry weather of early spring. It is very hard to manage your chicks when the mercury rises and there are so many showers and rainy days. Among small chicks bowel trouble will almost always result from such conditions, and those afflicted with gapes have need of sympathy, gape worms will multiply by the millions during damp weather, and as earth worms are always near the surface when the earth is wet, the chicks will pick them up in great numbers. We are fortunate enough not to be badly afflicted with gapes, but have had some experience, until we learned that they were more plentiful under the trees and so plan to keep them from these places until they are old enough to be practically safe. Lime scattered over the soil will help to some extent, but is best to move the coops into the sunshine. I do not know of any sure remedy for gapes, but to extract them. For this purpose a gape extractor may be purchased, but we have always used a horse hair, and have had good results from its use. There have been cases when like hospital reports "The operation was successful but the patient died." I well remember such an instance, a splendid young cockerel was sorely afflicted with these bothersome worms, and I thought to relieve him by such an operation, so I secured a stiff, strong horsehair and doubled it so as to make a loop at the end and probed for Mr. Worm, and much to my delight I got not only one but three. I became so elated that I entirely forgot my patient and believing that if one was a relief more would be a still greater relief. I tried again and again until I was much dismayed to have the cockerel gasp and die in my lap. Since then I have taken a few at a time and after a time have tried again, and the results have been more satisfactory. This is also great weather for mites and insects, pests of all descriptions, so do not lose sight of this fact and keep a sure watch for any signs of them. Each time the colony houses are cleaned, the roosts are well painted on all sides with crude carbolic acid and kerosene oil, applied with a wide paint brush. This is a good insectide and disinfectant. The floors to the colony houses have only coarse sand scattered over them now, and this makes them easy to clean, which is done every week and thereby they are kept in good condition. The first chicks which were hatched the last of March very much resemble adult fowls; they are developing finely and consuming no end of valuable grain to accomplish this end. The cockerels have all been removed from the pullets, and those not reserved for breeding purposes have been sold as broilers. Of course there will be more later, as it is impossible to select only the good ones at this age. They will change so quickly that a cockerel which promises to be very likely now, may develop into something that we do not care for, in a few weeks' time. But all those at all promising have been kept, as we have never been able to raise enough to supply the demand for breeders. Removing the cockerels has given the pullets more room in the houses which they can use to good advantage, and then it has relieved them from the unwelcome attentions, which surely does interfere with their best development. It is astonishing to see how much more grain a house of cockerels will consume than a house of pullets, and this difference is also noticeable between the young and adult fowls.

The hens are beginning to think of a vacation time, I think, as the egg yield has fallen off considerably during the past week, but this is as it should be; they cannot work all the time, and certainly have earned their rest time, and we know that they will be in readiness to fill the egg basket when the price is soaring skywards again, and they will have help in doing this because the pullets will also be ready for profit in October, so that their eggs will have reached marketable size by the time when they are most in demand. The first eggs of the pullets are naturally small, and we do not mix them with those of the hens, but they very soon reach a good size when they can be marketed with the hens'eggs. It is not good business to mix all sizes together, if you care about getting the highest market price. Make the name under which you sell your eggs, whether it be the name of your farm or your own name, stand for superior product. If you have not enough good sized eggs to sell, sell them for small eggs, and you will find in the end that you have gained. Not only the commission man to whom you may ship, but his customers will learn to know that eggs from your place and sold under your name, stand for eggs to be depended upon, and you will find that you can demand a better price than your neighbor, who carelessly packs all grades, sizes and colors together and sends them for what he can get, and "Believe me," as the small boy says, he does not get any more than he is entitled too. Of course if eggs are a secondary consideration you can afford to get them to market in the easiest possible way, and then again it is such a comfortable feeling to know that we have done the best that we could and have earned the reputation of being honorable.

Those of us who are expecting to exhibit at the early fall fairs must be watching out for favorable speci-

SILVER CAMPINE COCKEREL BRED AND OWNED BY HOMESTEAD CAMPINE FARM WAYLAND MASS
"HOMESTEAD" SILVER CAMPINES
The Vigorous Strain
Win at Boston 1915, thirteen regular prizes, including four firsts, specials for best display, best cock, hen, cockerel and best pen. Three firsts and many regular prizes at Springfield, 1914, also at other shows our winnings were equally good. In addition to their blue ribbon reputation our VIGOROUS STRAIN has an established reputation for stamina, vigor, early maturity and heavy laying that makes them most desirable. We can furnish stock that should win at any show in the country.
Our aim is full value, quality and satisfaction.
HOMESTEAD CAMPINE FARM
Box H 2 Wayland, Mass.

"Watch the Palace Show"

mens for this purpose. It is always hard to exhibit fowls at the early shows as their plumage is generally bad, but this is the case with all breeders, so we all stand an even chance. As unfair as it may seem it is nevertheless a fact, that the largest and best developed young bird usually receives more consideration than does the finer bird of a later hatch, so it behooves us to hatch early and rush development of the birds which we intend to exhibit early. If we possessed an unusually fine specimen which we cared to exhibit at a winter show, we could not be induced to show him at a fall show, the weather is so warm and they are as a rule so poorly cared for that it will ruin them for further exhibitions. Of course such shows as our state fairs do not come under this censure. Our New York State Fair is provided with a poultry building which far excels the majority of halls procurable for winter poultry exhibitions. It is complete in every way, and is cooped in the most approved manner and cared for in the same way, but the usual county fairs have no way of caring for them so comfortably. However it is a good place to make a start, and the information to be had is worth much to an amateur, and will go far toward stimulating the desire to excel, with which every true fancier is endowed.

HELPFUL HINTS

When the silver polish box is empty use common lump starch. Rub starch on with a damp cloth, let stand a few minutes and rub with a dry cheese cloth. When black cloth becomes shiny rub the spots with slices of raw potato. When chewing gum becomes stuck onto your clothing do not attempt to scrape it off, and thus ruin your skirt, simply hold a pice of ice to the spot when the gum will harden and can be crumbled off easily.

Dried coffee makes an excellent filler for pin cushions as it is rust proof.

Add a cupful of cooked rice when making beef loaf and the loaf will be moist and slice firmly.

To make a light and dark loaf cake, first bake the dark part, then when almost done remove from the oven and pour the light part over it, put it back in the oven and bake quickly.

Enameled ware when discolored, can be cleaned with a paste made of salt and vinegar.

Greasy coat collars can be cleaned thoroughly by sponging with alcohol in which salt has been dissolved.

* * *

Cucumber Salad—One large cucumber cubed, one-fourth teaspoonfull of salt, a few drops of onion juice, one-half cupful chopped celery, one-half cupful of pecan nuts, serve with mayonnaise.

Devilled Chicken—Stew the chicken until tender, salt while cooking and let stand until cool. When cold fry in two tablesponfuls of butter, one tablespoonful of Worcestershire sauce, one tablespoonful of tomato catsup, a dash of red pepper and a little prepared mustard. Roll the chicken into one-half cupful of the chicken broth. Cover and let cook slowly twenty minutes or more.

Egg Toast—Eggs on toast make a palatable dish. Cook together a tablespoonful each of flour and butter and add a half cupful of milk. Stir to smoothness, turn in six beaten eggs. Cook until thick, season and turn onto buttered toast.

Lemon or Orange Ice—One quart of water, one pound of sugar (if the lemons are extra sour it may be necessary to add a little more) and the juice of twelve oranges or six lemons, boil the water and sugar together for ten minutes then set aside to cool, then add the fruit juice and strain and freeze. When partly frozen stir in the whites of two eggs beaten to a stiff froth. Serve in glasses ornamenting the top with a flower.

Peach Compote—On two inch squares of stale sponge cake set half a peach, hollow side up, and fill the whole with whipped cream.

Apple Sauce Cake—One-half cupful of butter, one cupful of sugar, two cupfuls of flour, one cupful apple sauce, one-half teaspoonful of soda dissolved in a little hot water and mixed with the apple sauce, one-half teaspoonful each of cinnamon, nutmeg, salt and vanilla, add one-half cupful of raisins and bake in a slow oven.

MR. WM. O. JENNINGS

The Greater Buffalo, New York, Show will be held Thanksgiving week, November 22nd to 27th, with Mr. Wm. O. Jennings as secretary. Mr. Jennings is no stranger to the poultrymen through the country. He has always been active and a live wire in poultry work. Of course we will all miss W. C. Denny as secretary, but as his other duties prevent his serving the Buffalo directors have made the best possible choice that could have been made. Now let's all "boost" for Buffalo and make it one of the largest and best.—H. P. S.

Management On the Small Plant

By A. P. Marshall.

AT FIRST thought one might be inclined to think light of the idea of the importance of good management on a small plant but we believe if just a little thought is given the matter the importance of proper management of the small plant will assert itself. Just as soon as we begin to get the idea that everything is easy and it is going to come along nicely itself is the time when we will begin to run into difficulties little dreamed of and which will probably make an immense difference in the results of the year's work.

In choosing this subject it is the purpose to try and show the absolute necessity for good management on the one man plant in as large or perhaps even a larger proportion than in the case of the large plant where good management must prevail or end in rank failure. After all, a man who has his plant in limited area and is trying to carry out the complete round of poultry work as the man on the large plant with unlimited means at his disposal is, if he succeeds well, accomplishing more in his intensive way and has reason to feel greater credit for the success his good judgment brings.

Usually this can almost be determined the moment one comes onto a place. A general sense of tidiness is usually observant in every particular and there is a place for everything and everything is in its place. To see such a place and imagine the satistion of the manager who has brought about a particularly pleasing result is to most a revelation from any notion that careful, thoughtful management, with a view to appearances has no place where real profits are to be expected. The mere general tone of the place itself is a profit bringer that will show itself some day if there should be a turnover and it has an effect on all the neighbors that improves values all along the line for the whole community.

Just a few days ago the writer was able to observe the neatest small plant that he has ever been privileged to see. If ever anyone could have any doubts of the satisfaction of such a life as the owner of this small farm we are certain their doubts would very quickly be dispelled when they had hardly stepped through the gateway, after getting a fair size-up of the surroundings from the road. The place had just 6½ acres and every inch had its place of value in the arrangement. The house and surroundings immediately adjoining was like the best kept city lawn or lot that one could wish to see, with here and there a carefully trimmed cedar formed in neat shapes such as no florist could improve on, the circular earth plot about trimmed to perfection. Not much in the way of flower garden, growing perhaps only in a half satisfactory way, but just enough to make the front perfect in its order and apearance and nothing that was not just as clean and trim as all the other surroundings.

Every stick and outbuilding on the place to the front of the farm was painted a harmonious color with the whole and even the hen coops, brood coops and all that sort of thing including outside feed troughs or hoppers were painted a similar color to the house trimming, showing evidence of the wisdom of this plan in the perfect condition of all of these appliances wherever they were to be seen. To the side of the house and filling in the balance of the width of the place was a very thrifty looking field of potatoes and other garden truck every line being absolutely straight and the rows filled up without any breaks in evidence anywhere.

Back of this and where the coops could be handy to the dwelling and other buildings were the main breeding yards running across the farm and heavily shaded with large fruit trees, the conditions as to number of birds on the ground being such that the grass was in good shape and furnished all the green food necessary to the yarded birds. Here a couple of hundred white leghorns of good size, large than you generally see them, produce a profit off the small room allotted to them, that brings in a very comfortable profit to the owner.

Back of this the balance of the place is laid out to a big variety of fruits and except for a few potatoes at the extreme back end is used entirely for this purpose. To walk down the roadway running back from the front of one side of the place was to only strengthen the conviction that the general methods of clean careful management were producing results far more than the satisfaction of a personal pride in appearances. Not a blade nor weed was anywhere in evidence and it seemed as though cultivation would hardly be necessary for some time. Yet here was the owner with his horse and harrow going over the ground and loosening up the soil between the rows evidently never content that while the time was available the crop could not be benefitted by stirring up the soil to give it every chance of furnishing the elements necessary to get in ahead of those who are satisfied to get the lower prices with a slightly delayed production.

The wonder of the whole place is that it is kept in this wonderfully attractive condition by the work of the owner, Mr. Holman, with the aid of his horse and implements, but how could it be possible without having the work planned in a most resultful way so that the most could be secured for the least labor? In answer to a question, Mr. Holman said "Yes, it keeps me pretty busy keeping everything in the shape it is, but it pays and it's a great satisfaction to me." When asked what the place might be

bought for, an idea of the value of his pains became evident when he said he would have to have $15,000 for it. That, as a producer of a satisfactory living for him he could not afford to part with it for less money. Seems like pretty high value for fruit and poultry land, but here was a man who, by his individual, good intensive management, was deriving an excellent living and bringing up the value of his property to much more than those about him.

It was not our intention when starting to describe this place at all, but the case seemed to be such an excellent example of the biggest kind of results that it did not seem out of place to give a faint idea of the possibilities by reference to this man's excellent results. How about the small lot fancier? Can the same thing apply to him and with the same sort of good results? We believe it can and he has a chance to show his capability for good management to even a greater degree than where more room is available than the preparations require. In fact he must make everything show results or he cannot make the same proportional gain that may be possible where the investment is so very much less.

When one thinks of the innumerable failures that take place year after year, from the evident attempt to produce too much on a given place without a clear idea of what must be done to prevent the injury of a large part of the product by the abuse of the other it is small wonder that now and again you hear the remark "It can't be done," but the results of good management on small plants are always evidence that the most satisfactory results are possible if more thought and system are used in the carrying out of the work all the year round.

To keep changing the flock so that there is as it were, a good rotation, alternating between using the soil for growing birds, yarding breeders and producing garden truck or food for the flock, will keep a person busy so that every inch will be taken care of and each and every product be brought along in the way that it will make it produce the most in the least time. Unless poultrymen realize that where unlimited ground is not available they must alternate between using the land for birds and growing vegetation we believe there cannot be a real success for any length of time. Each and every breeder in his own particular location can figure this out to best suit his needs and we feel sure if where this has not been considered an essential rule to follow, to adopt it will make for added success and less danger of loss among the flock.

Our experience has proven that it is well possible to grow good quantities of fine garden truck and grow a crop of chickens to the best advantage on the same ground the same year the one helping the other and the

Mr. H. P. Schwab,
Rocheser, N. Y.

My Dear Sir and Friend:

"I want to congratulate you on the July issue of "Everybodys Poultry Magazine." Pretty hard to excel this issue. Bright and newsy and interesting. Keep the good work going.

Business seems to be picking up and it looks bright for the future, and I see no reason why we should not have a good trade this fall and winter. Eggs and poultry on the market are going to be higher than ever known, I believe. Grain will be cheaper and everybody will want chickens. Wishing you continued success, I am

Yours, etc.,

July 8th, 1915. U. R. FISHEL.

production of the vegetable growth taking from the soil any danger of souring which must result in failure in the production of the best type of chickens. To be sure, some thought must be given to planning the work so that one will not spoil the results of the other, but this is where the work becomes interesting and gives some satisfaction in being able to double up on the neighbors and accomplish what they feel is out of the question.

From Mating to Show Room.

The Growing of Quality Exhibition Stock Depends on Their Proper Care and Raising. Numbers Don't Count--By Haldie Nicholson,

HOW many times in the show room have you heard exhibitors say—"What chance have I in showing against, Young, Thompson, Owen Farms, Hawkins, Delafield, Thompkins, Etc., they breed 5,000 every year, while I only breed from 50 to 100?

What I wish to impress upon the reader in this article is that it does not matter how many you breed—but how good, and if you have the right quality your chance is equal to that of any.

To start with, if you are are a true fancier at heart you don't want over three pens mated up. Two is better than three, with three females in each pen, and these three females in each pen are better than six females, because if you have small matings you can watch their results more closely, and are able to keep a more detailed account of everything that happens in your yards. Always remember, then, that in any breder's yards, I don't care how large or how small a breeder he is, there is always one best pen. Then comes your second best and so on.

Now, I won't go into any details of how to hatch chicks outside of saying to always use hens if you are going to raise chicks for the show room. After my chicks are say one week old, I start feeding them bread crumbs, which can be bought at any grain dealers, and along with this I mix crushed oats, wheat middlings and a little bran. I scald all of this with buttermilk. Don't make the mash wet, make it crumbly. This I continue to feed right up until I exhibit the birds. After the chicks are a month old I feed theme twice a day with scratch feed. About two or three weeks before I exhibit my birds I put a little Scotch meal in my mash, also a little Hamburg steak. I also give the birds that I am taking great care of about one-half handful of sunflower seed every day.

Why a good many exhibitors do not succeed in putting good specimens into the show room is that they don't give the birds a fair show. Always give your birds as much as they can eat. The more they eat the better specimens you will get to put into the show room. Now I want you to read the following very carefully. Why incubator chicks never have a chance with chicks raised by the old mother hen is easily accounted for. Never try and make one hen bring up too many chicks, for the less she has the better they will be brought up because there are not so many mouths to eat the dainty morsels she finds. Also if she has a small flock she can brood them better at night.

I will just give you an instance of one breeder who I called upon some years ago. He said, "How do you ever get the growth and put such specimens as you do into the show? I was walking around with him in his fields where he raised his chickens. I stopped and asked him how many chicks he kept in that coop, pointing to an ordinary 2½x4 chicken coop. "Well," he said, "I keep about sixty chicks in that coop." I told him if he wanted to raise high grade specimens that there was room for about eight chicks in that same coop. I then asked him if he ever took notice of what happened in that coop from dark until daylight. Well, this is what happens: In this coop, or in any other overcrowded one, one little fellow becomes uneasy and stands up and that disturbs all the rest of the flock, so this will go on all night, and they don't get half of their sleep, whereas, if there are only eight chicks they go into their coop and, under ordinary conditions, they will sleep all night long.

Now, after the hen leaves her chicks I always try to keep the same little flock together in one coop. Never crowd them with two or three more flocks into one large coop. After the chicks get to four months old I always pick out my very best specimens, and I see that each of these birds roost in a separate compartment every nght so that they can rest, sleep and grow. Now, all of these little details will help you to bring up high grade specimens. Don't get it into your head that because your competitors have large farms and large accommodations that they have you beaten. In fact, if you will use your common sense, and you will raise enough birds for the room that you do have; you have a distinct advantage over the larger breeder. Or in other words, to sum up, the smaller your matings, the smaller your flocks of chicks the old hen has to bring up, the best food that you can possibly give them to eat, the better specimens you will get.

I have abou t an acre of land where I have always raised my chickens with the exception of the past two years where I now raise them on a 30 acre farm. But during the past two years I have always raised better specimens at home than on the farm, because I could give them my personal attention and see that all these small details were carried out.

In regard to green food I always seed down oats in every conceivable corner of my yard as follows:

After seeding down I put four foot wire around the seeded place, if the place is only as small as four feet square. Then after the oats have sprouted up to two inches high, I lift up the wire so that the chicks can run under. If you let the oats grow to two inches high before letting the chicks in they will clip the sprouted pieces off without pulling up the roots. The root I have found, will give the chicks sour crop. I lost a lot of chicks before I found this out. I don't use oat sprouters, as nature's way is best, and if you will every week seed down a small piece of land, if only four by four, it will supply your chicks in green food, and there is no back lot or yard that does not have some corner where you can seed down some oats. If you have several spare corners only seed one down at a time, or in other words, seed down one piece every four or five days, so as to keep your oats always coming young and tender. Raise as many chicks as you can supply green food for. If you will do this you will always be able to raise just as high class specimens as they can on the largest farm in America. The young seed, tender oats that the chickens can clip off will give better results than hard, tough grass through the summer. You will hardly realize how long it takes a flock of say thirty chickens to reduce down a small piece thickly set with oats.

By the above methods would say that I have raised as many first prize winners at America and Canada's leading shows as any other breeder in America, or Barred Rocks and Blue Orpingtons. If I can raise them, so can you. The larger the breeder is and the more easy a victim he is to defeat. I want the man who has only a small place or back yard not to get it into his head that he cannot raise high grade specimens, because he can, by careful attention to all of the small details. Above all, don't try to raise too many chickens.

Will You Do This?

When writing advertisers, mention "Everybodys." Thanks.

EVERYBODYS NEWS *from* EVERYWHERE

BY JAS. T. HUSTON

IT IS regrettable that the constitution of the A. P. A. does not provide that at least one member of the Elective Board shall be a Canadian. We trust that this may be remedied at the San Francisco meeting, believing that it would meet with the approval of all.

* * *

Fred. L. Kimmey, known to almost every member of the A. P. A. through his years of activity with the old organization, is now living at St. Anthony, Idaho. About a year ago Mr. Kimmey suffered a paralytic stroke, from which it is doubtful if he will ever recover his old activeness. His years of faithful work, both as member and officer endeared him in the hearts of all poultrymen and the results of his labors will live for years to come.

* * *

One of the pleasing features of the Poultry Show Season and one which brings us pleasant memories of past events, when in moments of relaxation from the strenuous work of show room activities, we have listened to that melodious voice of "Dick" Oak, with the query, "Does the flea bite?"

* * *

Talking of "Fleas" there are awful good fellows among them, home loving, pleasure giving, pleasure seeking crowd. No organization on earth has higher motives or opportunities for greater good. That these ideals will be demonstrated, the movements of the organization in the future will show.

* * *

The Wayne County, Penna., poultrymen are always up and doing, and through the medium of their local Association are creating great interest in pure bred poultry. Mr. Ernest Bodie, of Bethany, that County, informs us that never before has so much interest been taken in breeding as the past season, resulting in better flocks and more beginners.

* * *

We personally thank Mr. O. R. Ernst, associate editor of the Rhode Island Red Journal for his kind wishes towards Everybodys. Mr. Ernst's editorials in the Red Journal are always of interest, not only to the lovers of Reds, but all poultrymen in general.

* * *

It is stated that the Illinois Legislature recently passed a bill whereby the County boards of Supervisors may make annual appropriations of not to exceed $250 to the support of the local poultry shows of that state.

* * *

Mr. Rufus Delafield, owner of Sunswick Poultry Farm, South Plainfield, N. J., will devote his entire farm to the breeding of S. C. Buff Orpingtons, having offered for immediate sale his flock of S. C. Buff Leghorns, some two thousand head. Some exceptional bargains are offered in this lot and any of our readers who are interested should write Mr. Delafield.

* * *

The managers of the larger Fall Fair. Poultry Shows are showing increased activity during the past few weeks perfecting their arrangements for the coming season. The numerous State and Inter-State Fairs from the standpoint of the poultrymen will be larger and greater than ever.

* * *

Nothing is more pleasing to the readers of poultry publications than the illustrations contained therein, nevertheless

"When they are good, they are very, very good.
But when they are bad, they are horrid."

* * *

Speaking of illustrations, we cannot help but feel that many of the reproductions of prominent winners as pictured in the Poultry Publications of late, have not in all instances done the specimens justice. Exceptional birds are too difficult to produce to forego the pleasure of having them pictured at their best.

* * *

Some difference, we think, between faking a picture and giving an honest eye description of the bird. Better not have the bird pictured at all than not to be shown at its best.

* * *

A full carload of Missouri hens will be shown at the San Francisco Exhibition. It is needless to say that those with the highest egg records will have the places of prominence in the Missouri exhibit.

* * *

At the last Spokane, Washington, Poultry Exhibition, Mrs. M. F. Lowe, of that city, showed a pair of White Faced Spanish Fowls. This new variety was originated by Mrs. Lowe and resemble the White Faced Black, except in color.

* * *

Four young "bloods" of Garrett Hill, Penna., find that even to attend a cockfight is more expensive than spending a day with their best girl at the circus. It cost each of the quartette $23.25.

* * *

A Boys and Girls' Poultry Club has been organized in Jackson Co., Missouri, with a membership of 158. This juvenile organization is under the direction of the local farm bureau of that county.

* * *

Providence, R. I., enjoys the distinction of being one of America's strongest poultry show centers. The show to be held the coming winter is the 30th consecutive exhibition held in that city. Mr. Wm. H. Cangdon has filed the position of treasurer for twenty-two years, while Mr. W. I. Brown, the secretary, is on his 12th year as secretary. We would be pleased to hear from other poultry associations which have been in existence more than a quarter of a century.

* * *

Ex-Senator Len Small, of Kankakee, Ill., has been elected to the presidency of the State Board of Agriculture. This position will put Mr. Small in close touch with all pertaining to the Illinois State Fair, and his influence will undoubtedly be felt for good.

* * *

Farm Life is responsible for the following: "I have three chickens that were artificially hatched from eggs that were never laid," writes Mylo Culler, of Belle Vernon, Pa.

Now, read that over again, to be sure that you get it. "Artificially hatched from eggs that were never laid," he says, Here's the explanation, given in our correspondent's own words:

"I killed the laying hens, a Black Minorca, a White Orpington and a Rhode Island Red—procured the eggs—placed them in an incubator—got three fine chicks, white, black and red. They hatched April 19, and are doing fine.

"The most remarkable thing was the egg from the White Orpington—it did not have the shell entirely formed, so I completed it by using gum arabic and adhesive plaster."

* * *

Poultrymen from Penna., and Delaware gathered at the Pratt Experimenting Station near Morton, Penna., on Saturday, June 27th, in attendance to the field day exercises conducted by the Delaware County Poultry Association. Lecturers, practical demonstrators, etc., filled the day full of enjoyment for the many present, and all voted the first field day an unqualified success.

* * *

The poultrymen of Elizabethtown, Pa., added to the attractiveness of the large industrial parade held at that place on July 5th by having an elaborate float in the procession; the float representing a complete show room, with exhibition coops, containing winning specimens. The importance of the event carried with it the stopping of the train carrying the Liberty Bell across the continent. The president, secretary and superintendents were right on the job; in addition to the linen duster wore high silk hats and holding in their hands silver cups which will be competed for at their coming exhibition. They were given an enthusiastic reception all along the line of march.

* * *

"Watch the Palace Show" is the slogan adopted by Secretary Howell. The Poultrymen have been watching the Palace Show and one and all agree that it indeed is well worth watching. Each year sees increased entries as well as increased interest in all its branches. Secretary Howell's efforts have not been in vain.

* * *

Everybodys desires subscription solicitors at every Fall Fair and Winter Poultry Show in this country and Canada. Write for our liberal commissions and for territory. Our agents report that it is easy money to get subscriptions for a Magazine which everybody wants.

* * *

Everybodys Prize Cup offer has met with favor by all Show Secretaries and from present indications some "Cup Factory" will be running overtime to fill orders.

* * *

Geo. J. Hanks, secretary of the Williamsport Poultry Association, is conducting extensive operations for the Tide Water Pipe Co., throughout Penna. and the Middle West. Mr. Hanks, while one of the younger business men of Williamsport, Pa., has superintended some of the largest building operations in the Keystone State.

* * *

Mr. R. J. Walden, of Middleburg, Md., prominent in the eyes of poultrymen through his Maryland Strain of Barred Plymouth Rocks, has in company with Mrs. Walden, spent several weeks at the races near Cincinnati, Ohio, where Mr. Walden is racing a remarkable string of horses.

* * *

Hundreds of new subscribers to Everybodys request that their subscriptions begin with the April issue. We have in every instance complied with this request, but find that we are somewhat low in copies of May issue. If any of our readers have extra copies of that number, we would appreciate their informing us.

* * *

We appreciate the ready response made by the Secretaries of different specialty clubs in reply to our request for copies of the respective year books. Surely every breeder of fancy poultry should join the club representing their breed. Do it now, direct to the Secretary of the Club of which you should be a member.

* * *

Make a list of the shows you are contemplating making the coming season and write the secretary early as to your intention of showing. Our personal experience with poultry show managements prompts us to this suggestion, as it greatly aids the secretaries to a satisfactory arrangement of their premium lists.

The White Minorca

A General Purpose Fowl.--By Mrs. J. G. Osborn.

THE request for an article for "Everybodys" found me very busy, but the poultry business is a subject in which I am very much interested, so I will give the readers a few of my views, coupled with experience, as to what may be called a good general purpose fowl, but circumstances will not admit of this article receiving the careful preparation it demands. There are several reasons why, if we were confined to one breed of fowls we would prefer the White Minorca, and I will briefly mention a few of them. We began our experience in thorough bred poultry with White Leghorns, and found them all we could desire in regard to egg production, but for table use they were too small to "fill the bill" so we began to cast about, to find a larger fowl, that would also lay a large number of great white eggs, and at last tried the White Minorca and have never regretted our choice, or wished to exchange for any other breed. I have been breeding for over twenty-five years, and am more in love with them today than ever before, because I know their good qualities better the longer I breed them. They are large, beautiful and docile, not flighty like the Leghorn. As table fowls they are fit to be classed with the BEST, being finegrained, juicy, delicious eating and they are great layers, and stand confinement well making them alike desirable for the village fancier, as well as the farmer. They are non-sitters, which in this day and age of the world is not considered a defect, as nearly every poultry raiser, whether on a small or large scale prefers the incubator for hatching, instead of allowing the hen to spend so much of her valuable time sitting, when she should be filling the egg basket. In the show room their beauty is conspicuous, and they attract universal admiration, with their snow white plumage, and bright red combs and wattles, with pure white lobes, and many visitors who wish to replace their scrub stock by some pure bred variety arrange for a sitting or two of eggs, or select a breeding pen from this beautiful variety. Surely these are enough good points to make them great favorites with many people, for to see is to admire, so try them my friends, and see if I am not correct. I could say much more of this choice breed, but time will not permit.

(ED. NOTE—Mrs. J. G. Osborn, Fabins, N. Y., has been a conspicious figure in the show room for 20 or more years and has always been a "Booster" for the White Minorcas. Her winnings include records made at all the prominent exhibits for all these years.

MILK FOR YOUNG FOWLS

(By Mrs. George W. Church)

We have always used milk for our fowls when we had it to spare, but never had it in such abundance that we could use it in unlimited quantities until this year.

Consequently, the chicks, ducklings and goslings are growing faster than any we have raised previously.

When plenty of milk is available one need feed but little beef scrap.

The chickens are given all the buttermilk they will drink and also have fresh water before them. They prefer the milk and consume a surprising amount in the course of a day.

The Lactic Acid which it contains seems to be just what is needed to keep the bowels in good condition.

In addition to what is drank they get it baked in cakes of rice and corn meal or in a mixture of corn meal, middlings and bran. A little soda is added to the buttermilk to which the above ingredients are added to make a very stiff batter which is baked 2 hours, when it will be dry and crumbly.

When rice is used it is first cooked, then mixed with the meal and buttermilk and baked two hours.

These cakes may be fed dry or soaked in milk and then crumbled.

Some may think it too much bother to bake feed for chicks, but we find it pays very well indeed, no matter how many we have. By so doing and using in connection with milk scratch feed and bran one will have no cases of bowel trouble, hence every chick may be raised, barring accidents.

Ducklings are just as fond of milk as are chicks, but as they cannot, or at least do not, drink without wetting their eyes, it must be given carefully.

Goslings will drink without wetting their eyes, so we allow them milk occasionally, also feed them of the cakes moistened with sweet milk.

Sour milk heated until curd forms is excellent for chicks and young turkeys.

In fact milk in some form is most excellent for any kind of fowls. Fed to laying hens it will increase the egg yield materially. A farmer-poultryman near here who keeps 2,000 Leghorns and usually raises two or three thousand chicks feeds them on the milk of seventeen cows.

How To Get the Most For Your Money In Buying Stock

By M. L. Chapman

Every year during the months of June and July we get a good many letters from people who wish to buy chicks from our best matings at ages from six to ten weeks old. This summer we have been getting more inquiries than usual of this nature. Customers usually write us about as follows: That they would like some of our cockerels and pullets from some of our best matings to show at their Fall Fairs or early Winter show and they thought possibly by buying while partly grown and finish raising them themselves, they could buy them much cheaper. While we are always glad to hear from our customers, we believe that the above is a poor way for them to make money. This is a method we have tried out here at Rancocas and found it to be unsatisfactory for the following reasons, which may be of some interest to your readers: Although chicks when first hatched stand the railroad journey fairly well, they do not when partly grown. The hot season of the year is against safe shipping and it does growing chicks considerable harm to be deprived of proper feed and water for any length of time. Furthermore, chicks of that age seem to become terror stricken when cooped up and shipped away. They do not acquire the courage and independence of spirit that comes when matured. If shipped in any numbers, they will huddle in the corners and crowd each other almost to death. Furthermore, it is impossible to tell very much about the quality of the bird at that age. You might with the best intention in the world select a young bird or so for a customer at an early age and at the time the bird was wanted to make a creditable showing at some exhibition, he might be found to be a very ordinary specimen. On the other hand, the breeder might ship out a bird that would be the star of the year, and it is a proposition that is wrought with uncertainties to both sides.

I have always wondered why the public does not take more to the Summer sales of mature breeding stock that practically all breeders have at this time of the year. I think a dollar will go almost twice as far during July and August in the purchase of fine specimens as it will at any other time of the year. It is better for all concerned that the breeders keep on their own place the young birds until they are practically grown. Then the breeder knows what he has and can write his customer accordingly, and the buyer can get exactly what his needs require.

SILVER CAMPINE COCK WINNER OF THIRD PRIZE NEW YORK STATE FAIR SEPT. 1914 Bred & Owned By HOMESTEAD CAMPINE FARM WAYLAND MASS.

C. A. Phipps, Prop., Homestead Campine Farm, Wayland, Mass., calls his the "Vigorous Strain" Silver Campines. It was a fortunate day for the Campines when such a conscientious and careful student and breeder as Mr. Phipps took up the variety. He has set out to continue improving the Campines along the lines of Standard requirements but one of his greatest desires is to retain the wonderful laying qualities of this worthy breed and to establish and increase the vigor and vitality to the utmost. The above picture represents Mr. Phipps' 3rd prize cock at New York State Fair during the fall of 1914 and we are advised that this bird was the sire of many of this season's winners at New York and Boston shows, where they made such a wonderful record. He still shows wonderful vitality and is a good example of what Mr. Phipps is doing along these lines with his vigorous strain of Silver Campines.—A. O. Schilling.

D. W. YOUNG MONROE, N. Y.

A Poultry Feeding Plan

Poultry Feeding Should Be Reduced To a Scientific Plan.--By E. W. Good.

EVERY success in life is based upon a plan. Before anything is attempted, every detail should be thought out beforehand. Many disappointments might be averted through systematic work. Much valuable time is more than wasted by haphazard methods. The want of a carefully thought out working plan has caused many failures in the poultry business. In no department of poultry culture is there so much neglect as along the line of feeding. If one should inquire of the average poultryman how he fed for eggs, for instance, he would know about as much as before. The trouble is that it is thought unnecessary to feed a balanced ration for any purpose. Guesswork prevails in most feeding calculations.

The fact is that poultry feeding may be reduced to a scientific plan. What would be thought of a florist were he to pay no attention to soil fertility, ventilation, disinfection and temperature? Would he be expected to grow plants and flowers in all their perfection? The up-to-date florist gets what he goes after. He has made a practical study of all requirements and spares no pains to secure artificial conditions if natural surroundings are wanting. His work has certainly taken on the aspect of scientific culture. Vegetable growing has been placed upon a similar basis. The time is not far distant when the northern gardener will be able to successfully compete with his southern neighbor. He will do this through intelligent, systematic soil ventilation, drainage, irrigation and fertility. The future successful vegetable grower must bring everything under his control at all times. What has been said about flowers and vegetables applies with equal force to poultry feeding.

In feeding poultry correctly the surroundings must be taken into consideration. Of course different degrees of temperature call for changes in the feeding, which may be recognized in the plan. Whatever the climatic conditions the central idea of correct feeding is to make your fowls comfortable and contented. By the use of the thermometer the temperature may be read at any time. If the room be too cold, there should be more fowls included or more fattening food served. In the correctly constructed house the animal heat of the fowls is dependable for sufficient heat. It is better economy to provide proper quarters than to feed an excess of fat. The average vitality of fowls will not admit of sufficient food to warm themselves and produce many eggs at the same time.

No single feeding plan may do for all climates and conditions. The wide awake poultryman will formulate a plan that is best adapted to his particular environments. What is stated in this article can only be considered suggestive. As an example a plan will be submitted to meet average condition. This can be modified to suit variations in different localities. Before doing this let me assure the reader that no single formula will do for all conditions. The weak point in all ready mixed feeds lies in the fact that they are respectively based upon a single formula. If ready made feed mixers ever take the notion to place a brand on the market for winter, one for summer and about three different brands for the changing period between summer and winter, they will take a long step in the direction of normal egg-production.

The correct feeding plan, therefore, embraces a set of formulas which may be regarded as a schedule. Under the average conditions the nutritive ratio of 1:5 will give satisfactory results for winter feeding; 1:4 for summer. Now comes the change between these extremes of temperature. Passing from winter to summer the change may be made by weeks or months. If by weeks the transition would be more gradual than by months, but as that would necessitate a more complicated schedule, it has been thought best to make the change by months, which calls for three formulas. In changing from summer to winter, the formula for Sept. would read 1. 4. .25; for October, 1:4.5; for November, 1:4.75. On the other hand, changing from winter to summer, March would read, 1:4.75; April, 1:4.5 and May, 1:4.25. It will be noted that the readings for spring are simply reversed in autumn and vice versa. It may be said that these changes increase and decrease by fourths. Should the changes be desirable weekly, it would be governed by the scale of tenths.

It may be stated by some opponents to balanced feeds that the above plan is too visionary and impracticable, as there seems to be so much variation in the analysis of feeds. Granted the variation as being somewhat indefinite, yet the chemical readings are much preferable to guess-work. Right here it may be stated that every poultryman should be his own chemist In this way he would be able to detect any changes in the elements of feeds in the different stages of growth and varying conditions. This variation need be no serious handicap to scientific feeding. To approximate the

C. N. MYERS Box E Hanover, Pa.

standard would give very satisfactory results.

Go right to work now and formulate your schedule and be successful. Get ready for the moulting season now. The above plan adopted will lead your fowls right through the feather shedding and growing ordeal and at the same time produce an occasional egg.

As to growing and fattening stock, a ration should be planned to supply the essential elements of foods in the right proportions. This matter is not so difficult as laying plans for producing eggs. While chicks are growing and passing through their little moult, their rations should be a little wider than for egg production. This holds true even in summer time or hot climates. As they grow older the ratio may be gradually narrowed. As to fattening fowls, a ratio narrower than that of corn is necessary to insure health and rapid laying on of fat. Plenty of bulk should be used also to duly move the contents of the bowels. The main thing in fattening consists of keeping any part of the digestive tract from being clogged. Whatever may be the object of feeding adopt a systematic plan and adhere strictly to it. Drop all haphazard practice as so much hot iron.

QUESTIONS AND ANSWERS.

In this department we will answer questions, pertaining to poultry. It is for the free use of our subscribers. When special information in regard to diseases, etc. is desired, same will be furnished by mail to avoid delay. Ask your questions, let us help you.

Leroy, N. Y., July 10, 1915.

Q. Will you kindly, through your department of questions and answers, acquaint me how to produce a trap nest? Also, can you give me the reason for my little chicks eating each other's toes? I gave them some worms. Is that the cause of their doing so? F. E.

A. This is a long story to tell you how trap nests are made and rather complicated. You can probably buy them cheaper than you can make them. Will give you makers' names by letter, if wanted.

The trouble with your chicks is a usual one, but they will grow out of it. Believe that it started from them seeing blood on their toes, caused by punching or in some other way.

* * *

Aubudo, N. J., June 17, 1915.

Q. Will you kindly, through the columns of Everybodys, give me the formula whereby I can regulate a ration making the expense per hen, $1.60 per year, or less? I am an amateur in the business and would value your information highly. I also would desire you to acquaint me with the difference in the cost of keeping fowls in summer and in winter. C. L. B.

A. With a variety of foods grains rather sparingly can be tried. You can try mashes for the fowls and when this is done you can feed mashes once daily for the evening meal, during the summer. In the winter fowls should have a green food twice daily at least, scattered in the litter for them to exercise through. You can keep fowls for $1.50 or less, on an average, for a year. Grains should be proportioned somewhat according to their cost and food values. If you have beets, cabbage and potatoes the cost can be reduced by feeding them boiled (Hot mash). We recommend dry mashes to consist of bran, two parts; green meal, one part; middlings, one part; beef scrap, one tenth; gluten or oil meal, one-tenth part, and charcoal, one-tenth part.

* * *

Pittsburgh, Pa., June 15, 1915.

Q. Will you favor me with information for a remedy for chickens laying soft shelled eggs through the night on the roost? Also, what shall I do for lice? I have tried several different kinds of powders and disinfectants. Respectfully, W. M.

If this is common among your hens, they may have diseased egg producing organs. Are very fat or lack shell making material. Little can be done for this trouble, excepting to promote health through plenty of exercise, fresh air and correct feeding. If too fat, feed less and oblige them to exercise. Give plenty of good sharp grit and an abundance of oyster shells. If they have lice, try Licene, you will find it advertised in this magazine.

* * *

Shelby, Ohio, June 26, 1915.

Q. Will you please publish through the columns of your valuable paper the value of grain insilage for laying stock, as a daily ration, along with other grains or mashes, its effects, etc. R. E. W.

A. Do we understand that you refer to green cut ensilage? Green corn stalks for instance. Please explain your question fully and we will try and answer you in our next or by mail.

* * *

Eldorado, Pa., July 12, 1915.

Q. Will you kindly inform me through your valuable columns the reason for my loss of chicks. They seem suddenly to lose their strength, mope around in the morning and are dead by evening. I fail to find any lice of any kind, use good clean feeds, they are well housed and have every attention and advantages of farm range. I certainly would appreciate any information you may give me in this particular. W. O. W.

A. Cannot answer you intelligently without all detail being given, particularly so, as to their droppings and other conditions. Are you positive that they are free from lice, head lice in particular? Are they from inbred stock, if so, to what extent?

* * *

North Adams, Mass., July 9, 1915

Q. Is it usual to have several classes of pullet bred cockerels and cockerel bred pullets at the poultry show? (b) How can it be determined whether a bird entered is cockerel bred as strictly so or vice versa?. (c) Is it wise to enter a pullet bred male in the open class? F. D.

A. (a) It has become quite usual to have separate class of puulet and cockerel bred classes of Barred Rocks at the different shows, also in Brown Leghorns and some others. Would advise this and would like to see it followed at all poultry shows.

(b) It is very easy to determine from a bird whether it is cockerel bred or pullet bred. Either in male or female, the cockerel bred cockerel is standard exhibition color. while the female of the same line is much darker than the exhibition female. The pullet bred cockerel is several shades lighter than the exhibition bred cockerel, while the female of this line is our followed standard color in females.

(c) It will not do to enter a pullet bred male in the open exhibition class. He should be entered in the pullet bred class of cockerels.

FER-SUL

KILLS GERM DISEASES, LICE, FLEAS, ETC. IS A TONIC

Available everywhere on the Farm as a Disinfectant, Antiseptic and Deodorizer. Invaluable as a Flank and Udder Wash.
Recommended by the Highest Authorities in Animal and Poultry Husbandry.

CURES ROUP, CANKER, CHICKEN-POX, GAPES AND WHITE DIARRHOEA

(Price—$1.50 per gallon. Trial bottle, 12 ounces, 25 cents. Money returned if claims are not proven.

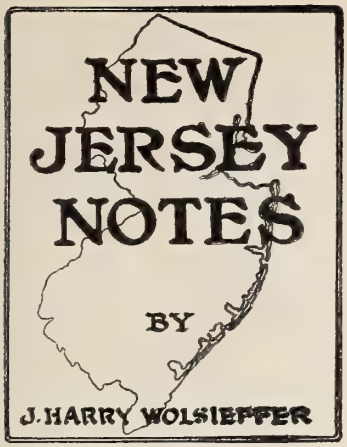
Stock for sale. Eggs from eight grand matings. Settings one-half price after May 1st. Send for Mating List.
BALCH & BROWN,
Manchester, Conn.



PROF. HARRY R. LEWIS, head of the poultry department of the New Jersey Experiment Station, is slowly recovering from a bad case of blood poisoning.

* * *

The New Jersey State Poultry Association, is in every way co-operating with the American Poultry Association, except when that body attempts to interfere with state rights. The members and officers of the association know best what is for the greatest good in state matters.

* * *

The early hatched pullets are maturing nicely this year and a good crop of high grade fowls can be looked for. It has been a good growing year for the Jersey poultry keepers and a neat balance should be shown when the winter "hen fruit" is shelled out.

* * *

Every indication points to a better show than ever at the Trenton fair this year. Each year under Mr. Harvey E. Rogers' management an improvement is being made and with a good entry assured in all the leading classes, Trenton will, as it should, take its place among the leading fall fairs.

* * *

D. Lincoln Orr, the well known writer, judge and breeder, writes us stating that when the American Poultry Association makes laws that tells one how they should make a living in poultry, then it is time to think about another association. There are quite a few in this neck of woods who are of the same opinion. Rule 17 is not popular among those who understand underlying motives.

* * *

Mr. E. E. Althouse, president and manager of the Poultry Item, Sellersville, Pa.; Prof. Frederick H. Stonburn, of Philadelphia, and Henry P. Schwab, editor of "Everybodys," were July visitors at Vineland, New Jersey, where they took a hurried look at the hundreds of neat poultry plants and thousands of peach tres, leaving with the impression that for poultry and fruit that so-called Petaluma of the East was all that was claimed for it.

Already there is a demand for pullets ready to lay this fall and winter. The demand in this zone will be greater than the supply, due to the high price of feeds, many poultry keepers sold close, only the choicest breeding fowls, have been retained for the 1916 hatching season, and the output of young stock is not as large as last year.

* * *

Cold storage poultry and eggs should be sold as such, and the co-operative committee will draft a bill covering cold storage regulation and place it in the hands of the legislative committee for action, of which Mr. C. J. Fisk is chairman. This is one of the many progressive things the New Jersey State Poultry Associatino has in line that will not only benefit the producer, but will also protect the consumer.

* * *

While the commercial flocks in New Jersey have long been known for their good producing powers, there is still much room for improvement. Quantity has been sought for in many cases where quality should have been the keynote. In this age of swiftness and big things, too many poultry keepers have tried to grow fast with the result that quality was a measure neglected. There is more profit in the 500 flock of quality than in the 1,000 flock of indifferent producers. Big units may be easy to handle, but the smaller units pay the largest profits.

* * *

Why a New Jersey page has been asked several times, in reply on can only say that size considered the "skeeter state" has the largest poultry interests of any state in the Union. The most powerful state poultry association the largest poultry plant in the world, the largest pigeon plant in the world, the Petaluma of the East is located in the Vineland district, with some three hundred poultry plants with from five hundred to two thousand laying hens on each plant. The fifty odd poultry associations, all members of the state association, making a membership of close to four thousand members, a good number of which read "Everybodys" for state news, that is one small reason why a New Jersey page.

* * *

Many poultry keepers are apt to neglect the breeding fowls at this time of the year when egg production is not so heavy and the hens entering the moult. More care should be taken of the breeders at all seasons, for they are the foundation of success or failure. Much poor fertility can be laid to the handling of the breeding stock both in hatching season and after.

* * *

Many poultry keepers are like farmers who do not stop the many leaks, much money is anually lost in the overcrowding of the plant's capacity.

* * *

In this age of big things, more fowls are carried on the average poultry plant than can properly be accommodated. Overcrowding is an evil that is indulged in by poultry keepers who know better, but each year seem to take a chance in hopes of getting away with it. In almost every case the final result sums up a loss, perhaps not in a death rate, but in under-sized fowls, and slower maturity. Smaller flocks but better quality could well be practiced on many of the plants in this state, with larger profits the result.

* * *

Dog days are here, and this means extra care for the growing stock, as well as the hens and males that are to be the 1916 breeders, the foundadation of the poultry success, shade, natural or artificial, must be provided to protect the fowls from the mid-summer sun. Clean and cool water should be provided several times during the day. Plenty of green food is essential. Where fowls are not on free range, roomy poultry houses that have been so constructed as to give plenty of ventilation is one of the essentials. Separate the males from the females; each will do better by themselves. Do not overcrowd and the chances are good stock when fall comes.

* * *

The Vineland Summer Show, open to Cumberland county, will be of much higher class than the 1914 show, which limited the entries to the Vineland district only. Many of New Jersey's leading breeders have their plants in the Cumberland county zone and a good class of fowls should be the result.

* * *

Prof. Henry R. Lewis and Victor G. Aubury, of the New Jersey Experiment Station, will place the awards on all utility classes; Wm. H. Card, Manchester, Conn., will judge the standard bred fowls. Last year 500 birds were shown, this number should be increased with the entry open to Cumberland county. Address Wm. D. Ridgway, Vineland, N. J., for full information. The dates are August 31-September 1, 2, 3,

ORCHARD FARM, - - Noroton Heights, Conn.

EDITOR JUDGES

By Theo. Hewes

NOW that some one has awakened the passengers and spilled all the beans and started something with reference to editor judges, it might interest the readers of Everybodys Poultry Magazine to hear from some one who has played the game from both sides of the table, and is interested in poultry show management, as well as poultry judging.

Having been an editor for a number of years, and judging quite a few shows while engaged in this business I do not believe that any breeder received any benefit from being an advertiser from me nor do I believe that any editor judge has awarded prizes in order that he might secure advertising contracts. I think I know personally every prominent judge in the United States, and have worked with nearly all of them at different exhibitions, and their business outside of judging has never been considered by me as any handicap, and I know from personal conversation, both in and out of the show, and especially during the time that we were awarding prizes that the only effort on the part of all of them seems to be to get the best bird on top. It is customary now, and always has been where judges were working together in the same show, but on different classes, that when there was a question in their mind as to which was the best of two or more specimens, that other judges in whom they have absolute confidence, were called in the class, not possibly to make the award, but to satisfy the judge as to whether he was right or wrong. This much for the judges.

Now, in looking at it from the other side, as one who is interested in the management of National shows and who employs annually a number of the best judges in the United States, I wish to say to the readers of Everybodys Poultry Magazine that it makes absolutely no difference to me whether a man is a poultry editor, whether he is associated with a poultry journal as solicitor, or whether he is an every day breeder, the whole thing simmers down to this one point: Do the exhibitors want him and will he draw a big entry, and do his work satisfactorily. I think this is the same view that the secretaries of all shows hold, and strange to say, there is a big demand on the part of exhibitors for editor judges, and this demand does not come from the big advertiser. The more experience one has, the better qualified he is to award prizes, and editor judges, or men who are employed by poultry journals as solicitors, are constantly traveling over the country, coming in contact with other breeders, can see the best there is in the country, and can form in their minds a higher ideal and come nearer awarding prizes according to the standard than the man of less experience, who depends entirely on the birds he sees in his own yard for comparison.

My own experience has been, and I think that the secretaries of other National shows have had like experience, that the best general satisfaction comes in cases where men are employed who are known as general judges—that is, men who judge all varieties. The most serious complaints that we ever had in Chicago have come from so-called "specialists" —men who are supposed to be experts on one or two varieties. They apparently unconsciously ride a hobby to death, and think more of some little thing that is over-ruled by the judge than they do of the general standard. If every judge would apply himself strictly to standard, learn it by heart, familiarize himself with the value of the different sections, and learn why one section in one breed is of more value than the same section in another breed, he will almost invariably satisfy the exhibitors in the class, and will put up a lot of winners that are a credit to the breed, to himself and to the business, and no matter whether he is employed as a poultry editor, a poultry solicitor, a hod carrier or a mail clerk, it makes no difference to the exhibitors, and it certainly makes no difference to the broad-minded secretaries who are trying their utmost to make the poultry business bigger and better in every way.

I have been asked lately why two judges were omitted from the Chicago show of 1915, both of them associated with poultry publications. Our reasons were simply these: In one case the editor of a publication personally requested that his employes must not be employed by us, as he needed every minute of their time in the show. In the other case the judge had worked two years in Chicago, had given general satisfaction, and was one of the best fellows on earth, but I knew when the judges were employed for 1915 that he would be secretary of the other Chicago show, and it would embarrass him to a certain extent to work for us. He felt for a time that he was turned down, until he appreciated the fact that we knew the stockholders were going to force the secretaryship on him, and they finally compelled him to take the position. We refer now to Mr. Hale, one of the best judges in the country, and a man of whom we think a great deal. Regardless of the fact that we are secretaries of two Chicago shows, I think that Mr. Hale feels that he has no better friend in the business than the writer, and I know that if I needed a friend I could not think of one to whom I would go for assistance quicker than Mr. Hale.

REARING GOSLINGS

By Mrs. Geo. M. Church

Of all the domestic fowls, the goslings seem to be the hardiest, also the easiest and least expensive to raise to maturity.

Many claim that the turkey is the most profitable of all fowls, because it requires no feed except a little grain to fatten for the market in the Fall. However, we have found turkey raising—for the neighbors—quite expensive. For a number of years we have raised fair-sized flocks, whose owners seldom saw them until just before Thanksgiving when they were taken home to fatten.

Progressive poultrymen do not manage their turkeys in this way,but among farmers it is the general custom.

There is no fowl that grows more rapidly than the goose. At exactly six weeks of age our goslings average a trifle over seven pounds each. We do not claim that is a remarkable weight as they were not forced and no special care was given them.

When first hatched no attempt was made to feed them until the third day, as they do not care to eat as soon as do chicks and ducklings. For this reason they should stand shipment as "day olds" very well.

The first feed consists of dry bread soaked in sweet milk squeezed dry and sprinkled with sand. To this is added a little hard boiled egg, which including the shell is mashed fine. If the weather has been favorable, so the goslings have been out where they could pick grass, no green stuff is added to the feed, otherwise a little finely cut dandelion, clover or grass is given. They are very fond of green stuff and will go about eating grass like so many sheep.

After a few days they are gradually changed to a grain mixture, which for a time is baked then as they grow older, fed raw, by moistening with milk or water.

Geese at any age are not hearty grain eaters, hence one may safely feed goslings all they will eat. The breeders should be fed sparingly of grain and be well supplied with green food at all times.

Our goslings are never allowed to get very wet until nearly feathered. Swimming water is not a necessity, but plenty of drinking water is.

Grit in some form, also oyster shell should be supplied. When first hatched there may be an occasional one which seems weak in the legs. As a rule they will be all right in a few days.

Last season we had one which could not walk at all. One leg went straight out behind and the other spread almost as bad towards the front. It seemed useless to let it live, but finally decided to do so and much to my surprise it began to straighten up so that by the end of the week it walked almost as well as any of them. A few days later it could not be distinguished by its walk.

Growing so rapidly as they do, the bones remain soft for some time so it is not unusual for one to get a wing twisted, which if left would be very unsightly. When this occurs it caused the wing to turn out at the second joint. This can be remedied by putting it in place with a piece of paste board underneath with the wing folded naturally. Around all wrap a narrow bandage, which should be left on for a few days.

Anyone who has a place for them, will find geese both profitable and interesting.

Careful Shopper.

" Ain't you rather young to be left in charge of a drug store;

" Perhaps; what can I do for you?"

" Do your employers know it's dangerous to leave a mere boy like you in charge of such a place"

"I am competent to serve you madam, if you will state your wants."

" Don't you know you might poison someone?"

" There is no danger of that, madam; what can I do for you?"

" Think I had better go to the store down the street."

" I can serve you just as well as they can and as cheaply."

" Well you may give me a two-cent stamp, but it doesn't look right." —Toronto Mail and Empire.

Schenley Heights Poultry Farm

Pittsburgh, Pa., June 10,1915

The R. T. French Co.,
Rochester, N. Y.

Gentlemen;

I most heartily endorse the regular use of "French's Poultry Mustard" am assured that it stimulates and adds vigor to the birds. My Single and Rose Comb Rhode Island Reds have never done better, never were better, and have never laid more eggs than this season. They have been kept in the best of health and have given the results we all wish for. The regular and liberal use of "French's Poultry Mustard" insures poultry success.

I remain
Yours very truly,
C. F. RANKIN, Prop.

What Does Rankin Say?

Here is his letter dated June 10th, 1915. Read the letter, because it will tell you one little secret of the success of the Rose and Single Comb Rhode Island Reds bred and exhibited by the Schenley Heights Poultry Farm. Mr. Ranklin believes in

French's Poultry Mustard

Do you? Notice he says: " 'The regular use;' 'it stimulates and adds vigor;' 'never laid more eggs;' 'the results we all wish for.' " Other users tell us it shortens the moult and hastens the resumption of laying. At a cost not to exceed ten cents per hen per year you can get results as satisfactory.

If your dealer cannot supply you, send direct.

The R. T. French Co., Dept. E., Rochester, N. Y.

At your request

We will gladly send a 32-page booklet giving Mr. Ralph Allen's experiments and other articles on Mustard and its relation to Poultry and increased egg production. Kindly mention your dealer's name when writing.

We regret to advise that Mr. E. R. Collins of Dunton, N. Y., a well known breeder of Bantams, passed away on June 14th. Mr. Collins has been a member of the National Bantam Association for a long time and was well known and respected in the fancy.

—Geo. L. Young.

The bantams lay larger eggs than any of the full-sized breeds, in proportion to their size. It must be remembered that, though a bantam, is small yet it consumes but little food compared with large breeds, and four of them can be kept in place of an ordinary hen. They are not suitable for market, nor will their eggs sell rapidly, but for home use and where there is but little space they will be very profitable, for despite their diminutive size they lay the average number of eggs and are easily kept in confinement.

From June's American Bantam Fancier

BANTAM BREEDING THE BEST SCHOOL

Many of us do not stop to think how empty our lives would be if we did not have some points of contact with the Universe. Even children manifest such desire when they strive to pluck a pretty flower or play with a dog or cat or baby bantam chick. And, it is stepping upward into the light of greater things, to know nature and call the plants and animals by their intimate names.

With the enlargement of the scope of this paper, we enter upon a new era and one which we fully believe will be interesting to all Bantam men and women. Our main reason for this step has been that the Bantam Fancier, more than any other poultryman, has had the training to fit him or her, to step into the "breach" and save our wild game birds by continuing to raise them under domestication.

In such work, they will be playing their part of "one stupendous whole" and act as a preserver of the created order of things.

When the Chicks Are Blue.

Keep Them Free From Mites and Lice. How To Do It. Prevention Is Better Than Cure--By E. M. Mangel.

LIFE unfortunately is not all a glorious, rosy tinted dawn to all little chicks that hatch. In their behalf I wish to tell the readers of Everybodys when and why some chicks are blue.

Did you ever see a young chick stand apart from his fellows peeping, peeping?

Well, fed, you may have wondered why he failed to grow. Perhaps he was scantily feathered and such feathers as he had ruffled and standing out from the body. His shoulders may have been hunched, his eyes sunken and he might have posed as well a picture of complete misery.

It may have been lice or mites that made this little chick blue.

Mites are pin point in size, They live in a crack or crevice of coop at day and at night they crawl upon the chick and suck his blood. Hungry mites are whitish grey and only visible if one looks closely. Well fed mites look red and are filled with the chicks' blood and are found in clusters hidden from the light. To rid the coop of them, clean out every bit of the surface of the coop, then fill a can with zenoleum and paint it in the corners and spray the whole coop, filling the corners, cracks, crevices, etc. The solution should be pretty strong, about ½ cup zenoleum to two quarts of water. The point is not to miss any part of the coop the size of a pin point. If you use a spray pump use plenty of force. It is a waste of time and material to fight mites in a half hearted way. Miss a dozen and in a short time there will be millions feeding upon your chicks.

Kerosene will kill mites, but not their eggs or nits. It is not lasting enough to be effective. Lime, air slaked or made into whitewash will not eradicate them unless made boiling hot or with crude carbolic acid or something of like nature added.

I like zenoleum for chicks because is lasting and is healing to the hands of the operator or feet of the chicks. Does not stain the feathers permanently, is not poisonous and has no injuring fumes. In fighting mites rid the coop of them. Keep it clean and your work is done. But not alone the coops; your chicks must also be freed from them. Use a good insect powder for dusting them. I use Persian Insect Powder.

Lice live upon chicks by day and night and breed upon their bodies as well as in the coops. You will find the lice generally upon the head or neck, under the wings or around the vent. They are not plainly visible to eye and unless numerous, may elude your search for them. They live upon the skin not the blood, and are found burrowed deep down in the fluff or feathers next to the skin. When the feathers or fluff are parted in search for them they crawl so quickly out of sight that it takes speed to catch a glimpse of them and many people are fooled into thinking their birds do not have any lice, when in truth they are full. To make certain, apply a drop of olive oil to the crown of the chick's head, another below each ear, still another to the throat below the bill. This generally reveals them. It is no time lost by putting a drop under each ear and around the vent. Kerosene, sulphur, lard, meat drippings or vaseline are things all too harsh and crude to use on tender down and skin of young chicks. The olive oil is just as effective and can be used liberally and is not so hard on chicks.

An ounce of prevention is worth a pound of cure. Why not treat the hen before setting her with, "Licene," and coop and nest with "Zenoleum" and have no lice upon your chicks?

There is no profit in feeding the lice or mites on the tender flesh and blood of poor little suffering chicks.

BRYAN POULTRY FARM, Route 1, Danielsville, Pa.

Department of the Great West

BY ESTELLE E. COLLIER
Tacoma, Washington

ANYONE wishing to find out the particulars of the great poultry and livestock exhibitions at the big Panama Pacific Exposition may write to D. O. Lively, chief of Livestock Dept., Panama Pacific Exhibition, San Francisco, or Thomas E. Quissenberry, Supt. of Poultry. This is a world's fair and not an exhibition for San Francisco and the coast and it behooves those of the East to send their birds. There is a big field, plenty of fanciers with the price for good Eastern birds, if those birds are up t othe expections of what we of the West want in our yards and there is no better time to sell and establish a trade that will grow from year to year than at this big fair. People do not like to send good money East for birds without being sure of what they will get in return. Should they see blue or even red ribbons on the coops of Eastern birds the word will go round from city to city on the coast that that breeder has stock that will be worth sending for. This is worth while. We want to see if we are all following and interpreting the Standard in the same way.

You would be surprised if you listened to the conversation of people standing around the show room at the different poultry shows when they see the birds of varieties little known. Those that especially attract attention are of the Spangled and Hooded types. If people raising the more rare varieties would show more of them at the fall fairs there would be created a demand for their favorites that would surprise many old fanciers. Prizes are always offered for the Standard varieties and those that will fill the classes in the more rare varieties will win good money. Popular breeds are made by such exhibitions that put them before the public and there create a demand for them. It is not a mere happen-so that a man new to the poultry business takes up any one particular breed. It is because he has been made familiar with them from having seen them in his neighbor's yard or from hearing their good points emphasized at the poultry shows where ha has gone for information. That is why poultry shows exist today, because a gathering place is necessary to display birds and make sales and interest others.

Seattle now has two poultry associations. One association is a stock company recently organized. They will put on a show in November. They offer valuable premiums and promise to have one of the largest exhibitions ever seen on the coast. It is keeping with the usual Seattle spirit that never takes a back seat in anything, especially in poultry matters.

San Jose, California, will be first on the list of California poultry shows. Her dates are set for October 6-9, 1915. Mr. W. S. Russell, one of the exposition judges, will place the awards at the show. Charles R. Harker, who is secretary of the San Jose show. He is editor of the Fancier's Monthly.

The entries for the big show at San Francisco close October 15, 1915. The great Northwest is busy counting birds for the big show and the prizes winners of the fall shows will be carefully groomed with a view to being in the running at San Francisco. We think our best equal to compete with the best the world can produce and our Eastern friends are urged to bring their best.

The above gives an unusually true conception of this phenomenal specimen. At the Boston Show, where above cockerel won the coveted blue ribbon last winter, he was adjudged by many as the best yet shown in the Leghorn classes at this National exhibition. Bred by D. W. Young, Monroe, N. Y.

Everybodys - - - Hanover, Pa.

We have tried year after year to raise turkeys on a limited amount of food, having been told by breeders that young turkeys will die if overfed. We find after eight or ten years that the only ones that thrive are those that have been allowed to feed at will and take all they could with a good supply of green food and buttermilk or sour milk before them from the day they are hatched. The hawks in our vicinity are so persistent and so numerous that we have to devise some scheme to keep them in a shelter until old enough to care for themselves. We have our young turkeys in coops about six by three, covered with a small mesh wire. This coop we move from day to day, allowing a few inches of green grass to be exposed, which they eat clean in a day. They grow beautifully until nearly ready to "throw the red" when they are able to forage without danger of hawks or improper food. If kept too long in an enclosure of this kind it will retard their growth and eventually kill them.

Out of a hundred young chix we lost all but about twenty before they went

The Aldrich Farms, Columbus, Ohio, has shown many grand winning birds and pens of birds at New York, Chicago, etc. They have been prominent winners always, East and West, and with worthy stock. Here is shown their first prize pen at Madison Square Garden, New York, the season of 1912-13. Apen of unsurpassed quality, ideals in form and of absolute sound color.

two months old and found in all the flocks attacked by hawks that not one of dark color was gone. The hawks sem to carry off only white or buff chickens. They cannot follow the movements of dark chickens at a distance. If one cannot become an expert shot one had better confine themselves to raising chickens of the darker breed

Editor Schwab should be sure to hold the meeting of the "Fleas" in San Francisco, for that is one town where the organization will feel at home. The health officer says that there are about sixty varieties of fleas in this world and some people up here in the Northwest are mean enough to say that Heinz fifty-seven varieties are not in it with Frisco.

California has organized a state poultry association and the first annual show will be held at Sacramento this winter. Sacramento is the capital of California, and a royal nice little city she is.

Speaking of California, that state has followed the good work done by the Washington and Oregon legislatures and passed a law governing the sale of Chinese eggs. The California law is one of the best passed. Venders of eggs must have signs in their places and each egg crate must be stamped "Imported." Restaurants and hotels must display a sign saying "Imported Eggs Served Here." Manufacturers must have cards printed and wrapped in each package where

I wish to compliment you on the attractive and valuable magazine you are putting out and to wish you all success with "Everybodys."

Yours very truly,
CHARLES W. ORTON,
Greensboro, N. C.

imported eggs have been used in making the contents. This sign must read "Imported Eggs have been used in making this article." This law protects the home poultrymen in every way. "Imported Eggs" are all eggs that are shipped into California from any point outside of the United States.

The following is the fair circuit for the Northwest:

Southwest Washington Fair, Chehalis, Aug. 23 to 28; G. R. Walker, secretary, Chehalis; Harry H. Collier, judge.

Walla Walla County Fair, September 13 to 18; R. H. Johnson, secretary.

Montana State Fair, Helena; September 20 to 25.

Washington State Fair, September 20 to 25; Frank Meredith, secretary, North Yakima; Harry H. Collier, superintendent of poultry; D. E. Hale, judge.

Spokane Inter-State Fair, September 13 to 16; Geo. P. Larsen, secretary, Spokane, Wash; J. G. Dickson, superintendent of poultry; D. E. Hale judge.

AMERICA is greatly favored in the number and character of its birds, which not only include some of the gems of the bird world, as the warblers and humming birds, but on the whole embrace few destructive species. Not only do many birds satisfy our aesthetic sense through their beautiful plumage and their sweet voices but they are marvelously adapted to their respective fields of activity. No other creatures are so well fitted to capture the flying insects as swallews, swifts and nighthawks. Among the avian ranks also are wrens, trim of body and agile of movement, that creep in and out of holes and crevices and explore rubbish heaps for hidden insects. The woodpecker, whose whole body exhibits wonderful adaptation of means to end, is provided with strong claws for holding firmly when at work, a chisel-like bill driven by powerful muscles to dig out insects, and a long extensible tongue to still further explore the hidden retreats of insects and drag forth the concealed larvae, safe from other foes. The creepers, titmice, warblers, flycatchers, quails, doves, and other families have each their own special field of activity. However unlike they may be in appearance, structure and habits, all are similar in one respect—they possess a never flagging appetite for insects and weed seeds.

One of the most useful groups of native birds is the sparrow family. While some of the tribe wear gay suits of many hues, most of the sparrows are clad in modest brown tints, and as they spend much of the time in grass and weeds are commonly over-looked. Unobtrusive as they are, they lay the farmer under a heavy debt of gratitude by their food habits, since their chosen fare consists largely of the seeds of weeds. Selecting a typical member of the group the tree sparrow for instance, one-fourth ounce of weed seed per day is a conservative estimate of the food of an adult. On this basis in a large agricultural state like Iowa tree sparrows eat annually approximately 875 tons of weed seeds. Some idea of the money value of this group of birds to the country may be gained from the statement that the total value of the farm products in the United States in 1910 reached the amazing sum of $8,926,000,000. If we estimate that the total consumption of weed seed by the combined members of the sparrow family resulted in the saving of 1 per cent of the crops,—not a violent assumption—the sum saved to farmers by these birds in 1910 was $89,260,000.

RED SUSSEX

Egg prices reduced this month. Sussex chickens have been hatched in the fall for years in England, to be ready for the fattening sheds the following spring. When given a place by themselves the birds grow rapidly. I usually have stock of all values for sale at reasonable prices. Some utility yearlings at this time. Late chickens of this breed do unusually well. Booklet free.

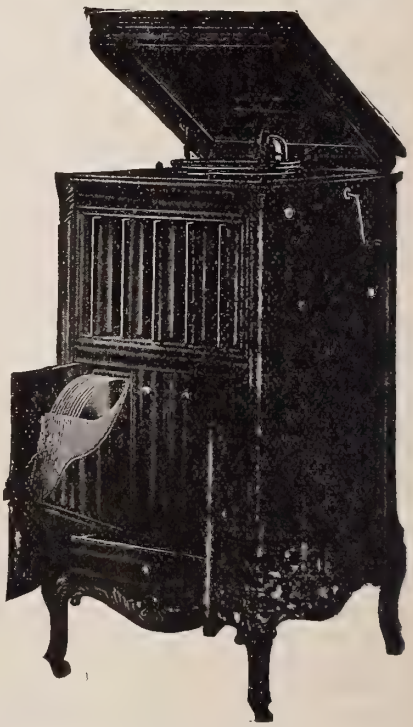
FIRST PRIZE



Columbia Grafonola De Luxe, Costs $200.00

Everybodys Poultry Magazine Publishing Company

HANOVER, PA.

LIST OF GRAND PRIZES

1st Prize--Columbia Grafonola "De Luxe" $200.00

This instrument represents the apex of achievement in cabinet instruments. There is none better made. It is of the highest and finest grade. (See illustration.)..It is 49 3-4 inches high, 22 1-2 inches wide and 24 inches deep.

2nd Prize--Columbia Grafonola "Mignonette" $100.

Its appearance is dignified and artistic and is of the same high quality as the larger size above. ..It is 44 3-4 inches high, 21 1-2 inches deep and 19 inches wide. See illustration.

3rd Prize--Columbia Grafonola "Favorite" $50.00

A popular "Favorite" with all lovers of music. This, like the above instrument, is fully equipped and can be had in Mahogany or Quartered Oak in Golden, Fumed or Early English finishes. See illustration.

Fourth Prize---$25.00 *Trio of Fowls, Incubator, or Brooder, Your Choice.*

Fifth Prize---$25.00 Trio of Fowls, Incubator or Brooder, Your Choice.

Sixth Prize---$15.00 Pair of Fowls, Incubator or Brooder, Your Choice.

Seventh Prize---$15.00 "

Eighth Prize---$10.00 Pair of Fowls, Incubator or Brooder, Your Choice.

Ninth Prize---$10.00 "

Tenth Prize---$10.00 "

In making your selection of Fowls, Incubators, or Brooders, they must be selected from advertisers in Everybodys

All the Music of All the World

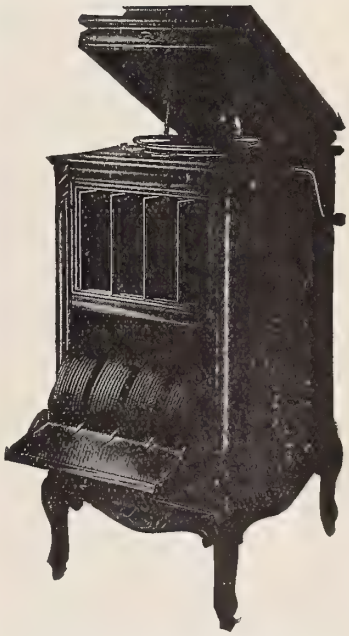
Can Be Had With the "Columbia Grafonola"

The voices of all the world's artists who have ever made disc records, without exception, are at your command if you own a Columbia. Because, although a majority of them make records exclusively for the Columbia Company, the instrument itself is so constructed that other makes of records can be played—the records are interchangeable.

Our catalogue will help you to gather a fair idea of the unequalled range of the Columbia repertoire and the unlimited variety of music that is engraved upon Columbia Records and reproduced by Columbia Instruments. Not only the voices of the great artists of opera, in solo and in concert numbers; not only the recordings of the world's great masters of the violin and of the piano; but the music of the great orchestras and bands, and of the soloists of those organizations, and the songs and humor of the stars of every stage—music for your every mood and for every occasion that music meets; music for the quiet family hour, for the cheer of visitors, for the dance, for indoors or outdoors, at home, on the yacht, at the club, in the church and in the school. **This is truly "the one incomparabl musical instrument," and "the one most versatile and indispensable entertainer."**

"THE BABY OF THE HOME CAN PLAY IT"

SECOND PRIZE



COLUMBIA GRAFONOLA
"Mignonette" Cost $100.00
Free to person sending in the second largest number of subscriptions before Sept 15.

The Possibilities In Poultry Breeding

(Continued from Page 318)

future simply means that we must make the most of the present.

Today we are confronted with a double problem as relates to poultry; shall we breed strictly for utility or for beauty? Or can the two qualities be combined? Of course they can and are, but not always at their maximum value. In other words a well bred, but from the fancy standpoint, faulty hen, can be the best layer in a flock, but the fancier is forced to discard her because she is faulty, and as has been constantly demonstrated, faults are transmitted far and more readily than are virtues.

In order to wage beauty and utility it would probably be necessary to establish a different type for most of our breeds and varieties for where laying quality is the main consideration there is without any doubt a certain type and according to my observations, such type does not conform with the ideal embodied in the "Standard."

In a study of this kind we have to give wide recognition to the efforts and results obtained by the several laying competitors; all breeds and varieties have had reasonable representation; all varieties have produced specimens giving splendid results and no one breed or variety has stood out as absolutely the best under all conditions; possibly the English Leghorn owned by Tom Barron, deserves the highest honors; at any rate we may assume that they represent the best laying strain of White Leghorns, possibly the best laying fowls in the wide world; of course, I'm not saying positively that this is so, but am rather making a rash assumption for the sake of argument.

Photographs of these Leghorns demonstrate clearly that from our ideas of beauty they would not in a country fair, if judged by our Standard, in fact, it is more than likely that any of our licensed judges would disqualify them, for they all show a positive tendency to what we call "squirrel tail."

Three years ago I had a pullet in the Missouri competition, which took third place in a class of 656 pullets and hens of all varieties, she laid 245 eggs in the year's trial, was a pullet bred Barred Rock of ordinary quality in color and very faulty in shape, in that her back appeared to be short through carrying the tail too high; no judges would have given her a second look.

I do not think I have any right to criticise the many other birds which have given grand results as layers, in fact, I haven't the right to do so, in that my knowledge and judgment results simply from studying their photographs and I do not consider that a safe criterion; but judging by the pictures mighty few of these wonderful performers would win blue ribbons in a beauty show. They would lose out on shape.

Utility in the chicken business means in the first place, eggs, and then more eggs, secondary value must be placed on carcass value, the latter clause embraces squabs, broilers, wasters and storing hens, but our standard has never given one thought to any utility value, its one endeavor being to clothe every breed with a distinctive type, each variety, with certain color and markings, these Standard qualities form our ideals of beauty; the nearer a Plymouth Rock comes to the acceptable form and color, the more beautiful it is; but if a Plymouth Rock was shaped like a beautiful Leghorn, it would be a very ugly Plymouth Rock; if a Leghorn looked like a beautiful Wyandotte, it would be a very ugly Leghorn; so regardless of how beautiful a chicken may be it is not beautiful unless it conforms to the type selected for that breed.

Now we will try and get back to the first thought in this article; that is how are we to combine beauty and untility? I do not yet admit but that our accepted forms of beauty might produce the highest utility quality, but the information at hand raises a doubt that is much larger than "a man's hand;" for it seems to be demonstrated that the best layers do not conform to the popular and standard type as generally accepted for nearly all breeds, in that these great performers all show a tendency to abruptly rising tails, and my own experience has taught that practically every good layer is inclined to carry the tail at a high angle; possibly this error in form is caused by excessive laying, for it seldom shows in the pullet until she has been laying some time, if it appeared at an earlier period she would be discarded.

Squabs, roasters and stewing hens are valued by the pound, according to quality in their various classes and uses; certain breeds are more popular than others because they are better and we must accept the judgment of the buyer on this point; if the buyer prefers a Plymouth Rock to a Langshan, Leghorn or Brahma, he makes such preference because he believes he will be benefited in such choice; and in this matter money talks, therefore, produce men pay a better price per pound for Plymouth Rocks, Wyandottes and Reds than they do for less popular carcasses. Therefore, and in the interests of utility, it stands to reason that breeds of a certain type have a decided advantage over other breeds.

If it could be shown that the breeds which suffer a carcass disadvantage, held a positive advantage as layers, then we might call the matter square, but the Rocks, Dottes and Reds are certainly the equals in laying when compared with the Leghorns, Langshans and Brahmas.

I realize that the argument contained in the last paragraph is broad, but I'm trying to make a point that will stick and have to make my comparisons as wide as possible.

The natural trend of this article is to show that the Standard is no help to those who are grasping every quality which goes toward furthering utility value. I do not mean that every hen which carries a squirrel tail has got to be a good layer, or even to infer that the higher she carries it the more eggs she will lay; but any and every grand performer is entitled to perpetuate her valuable quality regardless of her departure from Standard beauty; her performance entitles

NEW YORK STATE FAIR

SYRACUSE, N. Y., September 13th to 18th, 1915

FANCIERS: Exhibit Your Birds This Year At

THE GREATER BUFFALO SHOW

Thanksgiving Week—November 22 to 27, 1915

Buffalo Show ranks as one of the four leading Poultry Shows of America. Its early date and large daily attendance of poultrymen make it the BIG SELLING SHOW of the season. Increase your sales by exhibiting with us. Percy Cook, well known Orpington breeder, writes: "An excellent show for sales and our winnings at it brought us a great deal of business." Buffalo has half a million inhabitants. Is within a night's journey of over thirty-two millions of people, making it convenient for a large number of Eastern, Western and Canadian buyers to attend.

Reasonable Entry Fees. Thousands of Dollars in Regular and Special Prizes

For information and early copy of Premium List, address

WILLIAM O. JENNINGS, Secretary. BUFFALO, N. Y.

her to her own form of beauty and if her type proves to be a sound foundation for high performance in the future generation the Standard will come when you beckon and prove your tale true.

This is the future of the chicken business; performance first—the standard will follow.

* * *

By John W. Ward, Jr., Pennington, N. J.:

Replying to your very valued favor of recent date would say that "The Possibilities in Poultry Breeding" to a breeder, I might well say breeders, judging from the letters that reach my desk, of Cornish, at the present time, are extremely bright and rosy.

Certainly, Cornish are going up, up, up the ladder of popularity and here in New Jersey with an unusual amount or rain fall, and warm rains at that, early in the Spring, the fanciers of Cornish are better fixed than ever before to meet the demand that there is sure to be for "The Better Kind" of Cornish stock and showbirds this fall and winter, for we have had these warm rains to aid us in keeping abundant grass and other vegetation, which is essential to the quick growth of a young Cornish fowl.

True, feed is high, and that is where breeders of Cornish that are situated where free range is to be had, have it on breeders of other varieties, for if there is anything on earth that will eat as much nice clover and grass as a growing Cornish chick, cows of course out of the competition, the writer is from Missouri, and "you have to show me." And the youngsters will make bone and grow flesh on it, too. Here at "Windcrest," after the little fellows are two weeks old, the doors of the coops are never closed and it is out at 4 a. m. and up all day for the "peeps," "mamma" included. They go where they please and do what they please, ripping up the rosebeds included.

You ask, "Don't some of them die if you let them out in this manner?" Our reply is "Yes, several of them, but it is a rare thing in the ones that are left to find a case of A——haw ——ch——ew later on if a draft happens to blow on them, and that comfort is worth something." The one that live are fit to go through life even unto a ripe old age.

The Cornish situation is brighter, better than ever before. The birds are coming to their own, gaining favor as they are becoming better known, and will continue to gain, for they present to the world, the last word in table poultry, a fair egg layer and a fowl that is not expensive to keep.

* * *

By Walter Keller, Philadelphia, Pa.:

"The center of the earth and the end of space, with man somewhere between, just where depends on the man."

So it is with the poultry industry. There is no possible limit to its investment. There do, it is true, arise from time to time, temporary obstacles, but it is an industry endangered by no conceivable competition, no magic formulae or secrets, and no insurmountable difficulty. It thrives in the Tropics, flourishes in the Temperate and blossoms fruitfully in the Arctic region. It is the sole source of supply of a race-old article of diet; a twin industry, in age, of the ancient shepherd's craft; and needs only to be watered with common sense and nourished with honest toil to render to its devotee the full fruits of its golden profits. This, in a general fashion, is our opinion of "the possibilities of poultry breeding."

Until the request came for our views, we had classed this as a topic more ancient than the shape of the earth. We considered it settled long ago and accumulating the dust of ages along with other solved problems of the Stone Age, even yet, we are loath to believe that there are any who doubt the answer and it is with a feeing doubtlessly somewhat akin to that of our pre-historic forebear who tightened up his gee string, seized his stone hatchet and went forth to do battle with some sabre-toothed tiger or cave bear, that we attempt to even feebly set forth our views.

Perhaps, if a feeling of doubt as to the possibilities of the industry does exist, it is because the doubter neither judges by the past nor looks into the future. The industry today in in a stage of transition.

It was once a by-product, a "hanger-on" of farm activities. The modern world has no use for hangers-on." They are either developed into major industries or they sing by the wayside into peaceful and merciful oblivion. Today the poultry industry is just emerging from its swaddling clothes and timidly taking its place with the more blatant but also more stable activities of man. It hasn't tried it's wings; it dreams of, but does not know its strength; it hesitates, like a boy about to plunge into the old swimming pool for the first frolic of the season. When the fateful day on which it first realizes and reveals its strength comes, when poultrymen begin to appreciate that they have some rights and demand them; then, and only then, will the industry be given and take is rightful place among the leaders of the world's productive activities.

No hibernating moujik of Russia's remotest lands has been slower to insist on obtaining his rights or taking steps to procure them than has the ancient craft of poultry breeding. The key that is lacking to unlock the gates to the rightful domain is that of organization.

We have frequently heard it said that the industry has its organizations. Organizations bearing on certain phases it has had for nearly a half a century, and fairly effective they have been in their own line or industry, but an organization that was inclusive, with broad ideals, working for the "greatest good of the greatest number," is yet to be born. But it is coming, because it has to comes. The signs are in the skies for the wise to read.

Again, how often have we heard it said that poultry breeding was a little fellow's job and but a hobby or side line of thousands and that with such conditions organization was impossible or if it came would crowd out or discourage the smaller man. What a fallacy! Has the development of the American iron and steel industry lessened the number or weakened the blacksmiths and ironworkers? Do great hospitals and medical colleges lessen the need or number of physicians?

Organization--Organization of powerful state and national departments for aiding the industry with research

ALLENTOWN FAIR

"Noted for the way it does things and the things it does."

September 21, 22, 23, 24, 1915

Has annually one of the largest and best poultry shows held in America.

Held in two large, exclusive poultry show buildings that have light and ventilation equal to outdoors and fully equipped with new Empire Coops.

Over $5,000 offered in Prize Monies, with absolutely no favoritism and birds handled by old experienced employes.

Try Allentown this year and prove these good and unusual things for yourself For Premium List write H. B. Schall, Ben'l Sec'y, Allentown, Pa. Address all other correspondence to

RUDOLPH SWEISSFURTH. Supt. Pigeons.

W. THEO. WITTMAN, Supt. Poultry.

and assistance and proper appropriations, compatiable with the size and dignity of the work. Organization of selling bodies to standardize, grade and secure fair prices for the products of the hen. Organization for inspection and raising of the standards of poultry bred on the farms. Organization for favorable buying. All will come.

We are not slow to recognize the dangers of over-organization, but that is a term that cannot be attached to the foregoing suggestions. All these things are today done in certain other less important lines of breeding and in our own country. If you doubt the feasibility of their adoption to the poultry industry, look to Denmark today or to the once happy land of Belgium in the past.

Every now and then comes a period of business depression, of high priced feeds, or of poor breeding conditions. Then, because there is no organization to enable a poultryman to secure his just prices or demands, he must need bear the losses himself instead of sharing them with the consumer who reaped with him the profits in balmier days. To a certain extent the industry has been laboring under such a combination of circumstances during the past year or so. It signifies nothing, considered as a whole, and perhaps has been a benefit in purging from the solid ranks those weak of heart and determination.

Maybe our thoughts are too roseate to suit some more pessimistic. Perhaps we are dreaming unwisely—but we do trust the readers, even if they do not agree, will do us the credit to believe that our thoughts are honest and sincere. With the ever increasing study and organization of industry, we believe implicitly that the possibilities of poultry breeding are today greater, brighter and nearer realization of the justice due them as an industry of the foremost rank than at any period of its past.

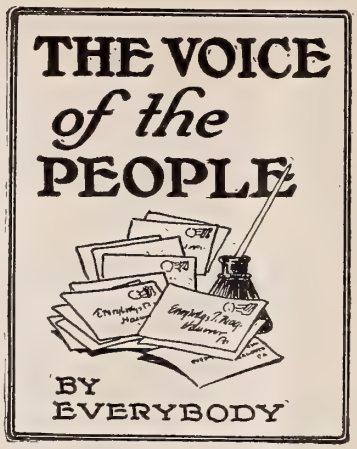
* * *

By Guy Daily, Jeffersonville, Ind.:

What are my views on the "Possibilities in Poultry Breeding?" This is a subject that to treat thoroughly would make a very long article, although it may be summed up in just one word: "Unlimited." From all indications, in my opinion, the fellow who has been gradually fighting his way toward the top and now has a good sized flock of high class birds, will surely reap a harvest the coming season. Low fertility and the cold, wet weather that has been prevalent all over the country has cut the poultry crop to a minimum and this alone will have a tendency to boost the demand. For the beginner, the inducements were never greater than they are at present and they are steadily increasing.

I am confident that this will be by far the greatest season we have ever experienced at "Fairview" and never before now, have we been in better position to take care of the business that is coming our way. Business conditions are generally improving all over the country and from the way the inquiries are pouring in, the poultry business is in line for one of the greatest seasons poultrymen have ever experienced.

(Continued next month.)



VOICE OF THE PEOPLE.

This department is for all matters of interest. Our readers are requested to send us such items of value and interest, also comments on questions of the day. All join in and make this a live proposition.

PRUNING AND CARING FOR ROSES

Now that the June roses are past, it might not be amiss to give a little attention to their preparation for another set of blooms, those to be borne in the autumn. It is not everybody having bushes of such famous hybrid perpetuals as Gen. Jacque, Mrs. John Laing, Magna Charta, Paul Neyron, Margaret Dickson, Frau Karl Druschki, etc., in their gardens, who has had the pleasure of a nice crop of roses in the fall. But this can be had if proper care is given the bushes after the June flowers are spent; and especially in the torrid months of July and August.

After the June flowers are gone, the flowering shoots should be pruned back to a couple of healthy eyes. From these eyes, in a short time, a new growth will start which is the flowering for the autumn. If the bushes show signs of being afflicted with red spider, a syringing of the lower foliage every day with the hose is the remedy. If leaf rollers or caterpillars are in evidence a spray of arsenate of lead should be applied. And for aphis, or green fly, nothing is more effective than a weak nicotine solution.

The work is well worth the while as the roses obtained in October are of superior size, substance and fragrance and sure to repay the true rose lover for the extra pains taken.

In latter July and August there are usually dry spells that are often disastrous to the rose plants. The leaves lose their lustre, the late buds refuse to set and the wood becomes dry and hard. This condition can be avoided by using the hose or sprinkling can freely during the dry, hot period. Then, too, a little extra nourishment such as supplied by a light mulch of well decayed manure spread about the roots will be found of great value in keeping the bushes in that deep green color that bespeaks health.

Exhibiting At Fall Fairs

By Charles D. Cleveland.

A VERY eminent writer has said that if a man succeeds in maka better mouse trap or any other device which is superior to all others the world will find its way to his obscure home to buy.

In a sense this is no doubt true, but the writer did not say how long it would take the world to find the inventor's workshop. It undoubtedly is true that if a breeder of any kind of live stock succeeds in perfecting a strain which has the winning ability the world (meaning the public) will find this out in time and the man's patience will ultimately be rewarded by finding that his stock is in demand; but as another eminent writer has said, "it is a long time between drinks," and it may be many years before the public becomes wise enough to know that this man's stock is the kind it ought to have. Many a breeder has become sick of waiting. He has abandoned his efforts because he thought they were not appreciated and because he was really hiding his light under a bushel. It takes a long time for enough people to find out where the best stock is and during that period the breeder is likely, unless he uses some business judgment and method, to starve to death. The principle applies to all forms of live stock breeding and the way out of the difficulty is two-fold.

First—He must show his stock in competition with other breeders in order to prove that "he has the goods." I have heard a number of breeders say that there is little or no benefit to be gained by exhibiting poultry at Fall Fairs. The argument is that the birds are all immature; do not show their real quality; are shipped in comparatively warm weather; perhaps crowded into the pens and that the class of persons which views the exhibits does not represent the buying public. An additional argument against fall showing is that it requires very early hatching, which is an annoyance and which has to take place at a time when it is difficult to secure fertility and often times very hard for the breeder to mate up his pens early enough in the season. Let us look at these arguments and see if they are sound.

First: As to the early hatching idea—

If you will look and observe carefully, and if you have the experience, you will note that in perhaps a majority of cases the early hatched birds appear to be superior. One reason for this is that they come into the world at a time when they are the only chicks to be cared for and thus receive proportionately a greater amount of attention than would have been the case where the hatching was done later in the season and at a time when the range was more crowded. You will undoubtedly also note that there is a tendency in many strains to develop slowly and not as rapidly as desired. One way to overcome this difficulty is to hatch early and breed from those birds in order to secure off-spring which have a tendency to more rapid advancement. The late hatched birds cannot be in their full maturity when bred from. They cannot have attained the size and ruggedness of constitution that the early chicks are enabled to develop before the cool weather sets in and, therefore, one way of overcoming this tendency of slow development is to breed from birds which plainly show a tendency to attain quicker maturity. In many varieties of fowls which are notoriously slow in developing early hatching is also a necessity, for without it size and proper plumage cannot be gotten in time for even the early winter shows, and I think there is now a growing tendency to set the incubator or hens earlier and earlier each season. If this practice is followed out, therefore, the birds will not be immature at the time of the fall fairs, but will surprise the public by their size and finished appearance, and this is one of the best advertisements that a breeder can have, for the public will immediately say, look what big birds these are of Mr. A.'s compared to those little chicks of Mr. B.'s. These big ones must surely be better and are now practically ready to breed from.

Again, the Fall Fairs are not what they used to be. Times are progressing and the management of practically every fair today is up to date in its accommodations and equipment. Each is striving, like the management of the winter shows, to outdo the other in all departments and as a consequence it will be found that the cooping and feeding arrangements at practically every good Fall Fair in the country will be of such high class that no breeder need be afraid to send his birds to the show. State Commissions are now constantly appropriating more money for larger poultry buildings and better equipment, and this, of course, is because these commissions see the growing interest that the farmers and all those in attendance at the fairs have in the poultry departments. More prize money is given now, more specials, more cups, and, therefore, there is a greater prestige and satisfaction in winning. Many of the men who have said that it was scarcely worth while to exhibit at Fall Fairs will find if they will send a string of birds that the competition is keen and that unless they have extra good specimens

their birds will be returned without any ribbons in the boxes.

From an advertising standpoint, of course, a showing at a fall fair is a great benefit. The breeder need not wait for the December or January numbers of the Poultry Magazines to advertise his stock. In winning a prize in August, September or October the field is open to him at once to let the public know well in advance that he has produced an extra fine flock of youngsters; that his last year's winners have come through the molt in fine condition and have again shown themselves capable of winning in hot competition. And this ability to advertise early will, of course, be beneficial in the sale of both the early stock and the later hatched birds. The early stock will go off quickly to others who wish to exhibit before the winter shows begin and the breeders' younger birds will be in demand for the winter shows. I confess that I would not have been very enthusiastic about showing at the old fashioned Fall Fairs. I would not have cared to have my good birds shown in a soap box under a flimsy canvas tent that was likely to be blown down during a severe thunder shower that would have soaked all the birds and made them look like drowned rats; perhaps giving them colds or other illness from which they might never have recovered. Such conditions, however, have passed and the birds are now taken as good care of physically and are as safe and well protected as they would be at any time of the year. We no longer face the old days when one judge was assigned to pass upon every variety of poultry, including water fowl, turkeys and pigeons. You will now-a-days find that a long list of high class judges are assigned to the various varieties in which they are specialists and all awards are placed just as carefully, as consistently and as honestly as they are at any of the so-called star exhibitions.

That the breeders realize these benefits which accrue from early showing is manifest from the increased number of entries that will be found from year to year in the catalogue of the poultry departments of our leading fairs. The poultrymen of this country are quick to appreciate any opportunities that may be thrown in their way and they have found that a little extra effort in beginning the hatching season somewhat earlier than before and the small amount of extra labor necessary to fit a string of early birds are more than repaid by having a more lengthy showing season where more opportunities for wins are possible and by having a longer period in which to advertise winners and by being enabled to save some of their best early hatched chicks from which again to raise early, quick maturing stock. So I say do not get "cold feet" about showing at Fall Fairs. You will there get an opportunity to show your stock and so distribute your advertising matter to the very class of persons whom you can reach at no other time or place, and you will find that you can make very advantageous sales if you will be on deck and alive to the situation.

Not only will it be profitable from a business standpoint to exhibit at these fairs but also very pleasant from a social standpoint. A breeder who is able to go with his birds to the Fall Fairs will there meet hundreds of other breeders whom he has not seen since the previous winter. He will have an opportunity of meeting new men who have just come into the game, making new friends as well as renewing old acquaintances. More time is given at these fairs for friendly evchange of xiews than can be had at the winter shows and, therefore, more real pleasure can be enjoyed by the breders in talking with one another.

In addition to this, of course, other departments of the fair may be very interesting to the poultry exhibitors. There is always found now at each of the fairs a very high class card of racing; fine cattle are exhibited in large numbers; up-to-date machinery of all kinds may be seen and many new devices and manufactures which sure can be enjoyed by the breeders ed on most farms can be seen in working order.

So I say, it is both good for your business and for your sociability to pick out a number of Fall Fairs and make it a point to show a high class lot of your birds at these shows, whether you are a breeder of poultry or pigeons. The managers will be, of course, glad to see you, will make everything as pleasant as possible and the judges themselves would always rather welcome a large exhibit than a small one.

Dutton's Niagara Strain of Rhode Island Reds

I do not buy my winners, I breed them, and they have the Blood Lines to Produce Winners. 93 Birds under ribbons at 6 shows in two years and winning many specials.

Have furnished winners for the largest shows. Will have for sale again next fall S. C. and R. C. Cockerels and Pullets. Bred from my winners.

Poultry Doings For the Year, Month By Month

A Practical Cockerel Coop and the Advantage of Same. Cull Out Early and Often In Both Young and Old Stock. Separate the Cockerels From the Pullets To Get Best Results. General Comments.--By Frank F. Conway.

IN my previous notes on "Poultry Doings" there seems to have been clear evidence that the printer must have been working both day and night shifts, when printing last month Big Budget, or "Everybodys," and fell asleep at the wheel, with the results that my notes had become somewhat twisted. Certain sentences starting where they were intended to end and vice versa—so much so that it would have taken an "Expert Decipherer" to figure out the sentences correctly. With the Editor's permission (who is no doubt to blame for loading the printer with so much literature in order to please you, Mr. Reader) I will endeavor to put the horse back where it belongs, i. e., in front of the wagon and thereby make the part of those notes in error more explicit.

I wrote at some length of the importance of affording ample shade for both the old and young stock during the Summer months and continued on which should have read as follows: "There is nothing so handy where one has several spare males as 'Cockerel Coops,' in fact no poultry plant where birds for exhibition are bred, can afford to be without them, not only can they be used for males, but make ideal coops for grown chicks which can be moved about to fresh ground from time to time."

"Here are the dimensions of a very practical coop I brought out several years ago and have become popular on several plants in England and can be made out of ordinary box lumber, so long as it is not too heavy. The coop is 6 feet long, 3 ft. 6 in. wide, 3 ft. 6 in. high in front and 3 ft. high at the back. The roof of the house is made to protrude 16 inches over the front. Half of the front is boarded up and floored, having no inside partition and the other front half is left open. Then make an enclosure to fit the front of the coop measuring 6 feet long, 3 ft. wide and boarded up 3 ft. high all around on three sides, over which stretch 2 inch mesh wire with a hole cut in the top so that you can feed and water the bird in cups that are fastened on the inside of the enclosure at a convenient height for the bird to feed out of and made moveable for easy cleaning. The whole enclosure is made box shape and detachable so that it can be readily moved. The coop itself is placed so that the sun is at the back, with the idea that the 16 inches of roofing that protrudes cast a shadow over the entire enclosure with the result that the bird never gets into the sun whatever. These coops are moved from time to time, on to fresh grass and if there is only one person to do the moving a simple way is to procure a round pole, 3 or 4 inches in diameter and a foot longer than the width of the house, which acts as a roller and one good push at the opposite end of the coop will practically place it on fresh ground, avoiding much heavy lifting These coops will be found of good service where natural shade is at a premium."

Prices of certain feeds still remain high, necessitating us to do a more rigorous culling than hitherto in order to allow nothing to run into the wrong channel and eat up the profits. Cull early and often is the motto of the day, those chicks that show roach or high backs; stubs in shanks; squirrel or wry tails; off color and ill-shaped birds also, the adults that have passed their usefulness and thereby give the remaining birds more room to develop and get the full benefit of all that is coming to them. It is a mistake to allow birds to overcrowd, which they are apt to do when too many are kept in one house, which invariably introduces into the flock catarrh and roup, which is brought on more so during rainy weather, causing the dampness to bring on an over-heat when huddled up in their sleeping quarters. I have known many cases where numbers of chicks have become suffocated and set the other chicks back so much that they never seemed to make the same development.

Where one has the space it is an excellent idea to separate all cockerels away from the pullets the earlier in chickenhood the better, not only will the cockerels make a more steady growth but will develop into larger birds and not be so apt to set too quick before they have obtained their actual and desired size. It is better that they should not see the pullets at all, but kept right away from them and by so doing perfect contentment will reign amongst the flock of cockerels and they can be kept together for a considerable longer time than if the pullets were kept continually amongst them.

It may happen that some of the cockerels are required for some early fall or winter show, that altho they have got the size for showing seem somewhat backward in alertness and undeveloped head-points to show to the best advantage. If such birds are allowed to run with a couple of young hens near laying or pullets that you do not care much about, say 10 days prior to the show all shyness will disappear and instead you will have a sprightly cockerel ready to show off to the judge when he comes around. Of course such birds will need a certain amount of handling in order to get him over any wildness. Often a good washing in soft warm water and soap acts like magic in taming a bird down and will help at the same time to develop the growth of feather. Such cockerel however, should never be placed back into the same flock, or else you will be sure to have a "Declaration of War" and the peace of the flock disturbed.

All pullets also should be run in moderate sized flocks and if one is fortunate to place the coop along side a clover field, one can almost see them grow and besides this you will have established a flock of early winter layers providing of course they are hatched 5 to 7 months according to the breed prior to that time.

TEN YEARS WITH ALLENTOWN FAIR

W. Theo Wittman will this year have completed ten years as secretary-superintendent of the Poultry Show of the Great Allentown Fair.

Taking into consideration the size of the show and the fact that most poultry show secretaries rarely stick for more than one or two years, this is a remarkable record.

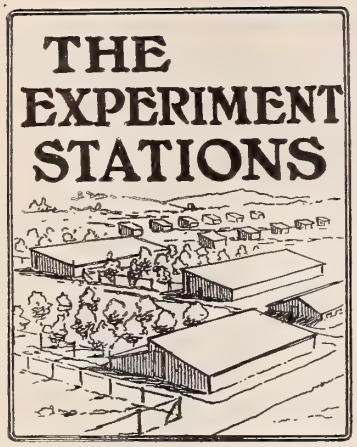
When Mr. Witman took hold of the Poultry Department at Allentown the entry fee was twenty-five cents a pair, there was no classification, practically no rules and the year before there had been thirtythree exhibitiors,

For the last few years now there have anually been something like 300 exhibitors and the necessity of yearly turning many away for lack of room. The entry fee was first raised to twenty-five a bird, then fifty cents and finally one dollar, marking Allentown as the first fair to charge this fee.

He also introduced many new features and methods in the conduct of a poultry exhibition, many of which are now in common use in poultry shows. The rules evolved were several years ago practically adopted by the American Poultry Association as their official show rules, since which time all rules have disappeared from the fair premium list save one—the Golden Rule. In short, adopting as the fair slogan, "Noted for the way it does things and the things it does," Mr. Wittman has first tried to make the show a show par-excellence and one where absolute fairness and impartiality ruled, where the dignity and integrity of the poultry industry and poultry shows were ever paramount. He has not been afraid of hard work, in fact his labors to give the poultry world an ideal and great poultry exhibition annually has been mostly a labor of love.

He marks his tenth year with a large addition to the already mammoth poultry show buildings and all who visit and show at Allentown this year are sure to be well pleased.

WE THANK YOU
For mentioning "Everybodys" when you write our advertisers.



JUNE REPORT OF MISSOURI AND NATIONAL EGG LAYING CONTESTS MTN. GROVE, MO.

One-Half the Entries Received for Next Contest—A Balanced Feed Ration For Egg Production—Plymouth Rocks Still in the Lead In Missouri Contest for Eight Months. White Leghorns Lead in the National Contest For Eight Months. White Leghorns Won Cup in Each Contest For Month of June.

FORTY-FIVE entries for the next contest have been received. The rules governing the contest are for free distribution, thus giving the breeders of all breeds and varieties the same opportunity to enter the contest. Arrangements are being made to take care of ninety pens. Therefore, half of the pens are already taken. Those who wait to see how their pullets develop before entering, are usually disappointed, for all pens are taken long before the contest begins, which is November 1.

* * *

One of the factors which determine egg production is the feed ration, not merely the quantity of feed given, but the elements contained therein.

Many questions are asked as to what a balanced ration for egg production is, and how to balance the ration.

In order to determine more fully the effect of certain rations, a number of experiments are in progress at this station. Each pen contains twenty hens.

The test with a wide ration, containing elements which would produce three yolks for each white, laid 379 eggs in the first six months.

The test with a narrow ration, containing elements which would produce two whites to each yolk, produced 269 eggs.

The test with a ration containing equal yolk and white material, but without minerals to produce the shell, produced 161 eggs.

The test where the ration contained the elements necessary to produce equally all parts of the egg, produced 1,603 eggs in the same time. This ration is called a balanced ration for egg production.

The yolk is principally carbohydrates; the white, protein; and the shell, minerals. Thus the three parts of the egg are made from three kinds of food.

The following ration is fairly well balanced for egg production. Instead of using the terms carbohydrates and protein, the terms 'yolks" and "whites" have been used. All fractions are omitted, therefore the table is only approximately correct.

Grain		Ylks.	White
Cracked corn...	150 lbs.	382	198
Wheat	150 lbs.	365	273
Mash			
Wheat bran....	20 lbs.	31	41
Middlings	20 lbs.	41	44
Corn meal	20 lbs.	52	27
Ground oats....	20 lbs.	39	31
Gluten meal	20 lbs.	46	86
Beef scraps.....	30 lbs.	32	332
Alfalfa meal...	5 lbs.	7	9
O P Oil Meal..	5 lbs.	8	25
	440 lbs.	1003	1066

The hens had access to oyster shell and grit, and were given two pounds of fine table salt and four pounds of fine charcoal in the above mash.

The basis for computing the number of yolks and whites produced by each kind of feed was that one pound of carbohydrates would produce 3 1-3 yolks; one pound of protein would produce 16 2-3 whites, this being the rate of the average hen here at the station.

It will be seen that from 150 lbs. of corn, 382 yolks and 198 whites are produced, therefore, it is not a balanced ration. The extra yolks are built into fat. In this way, hens fed on corn alone get extra fat, and we hear the old expression that the "hen is too fat to lay." The expression should be changed to read, "The hen can't lay is the reason she gets too fat."

A simple ration may be made as follows:

	Yolks	Whites
150 lbs. cracked corn....	382	198
150 lbs. Wheat.....	365	273
25 lbs. beef scraps....	25	275
	772	746

This ration would give the best results where the hens have free range, because it contains no mash, thus requiring the hen to do the grinding of the food. The kind of food she gets on the range should be considered, however.

If the hen has the ability to produce 24 eggs in one month when fed a balanced ration, but is fed an unbalanced ration like corn alone, which produces two yolks for each white, instead of making 48 yolks in order to produce 24 eggs, she makes only the 24 yolks, but can complete only twelve eggs. The same thing is true of the whites. It is the same proposition of "no chain being stronger than its weakest link." No hen will lay more eggs than the weakest part of the feed ration.

* * *

All hens in the Missouri contest good and bad, averaged more than 50 per cent. egg yield during June, and have averaged 108 eggs each for eight months. The average for June was approximately 16 eggs per hen, being one egg less on the average than in May.

Three Plymouth Rock pens are still in the lead. The ten highest pens for eight months are as follows:

Pen 34—Barred Rocks.....715 eggs
" 40—Barred Rocks.....701 "
" 38—White Rocks.....685 "
" 6—S. C. White Leghorns .....671 "
" 2—S. C. White Leghorns .....666 "
" 10—S. C. White Leghorns .....653 "
" 26—Buff Wyandottes..644 "
" 4—S. C. White Leghorns .....635 "
" 14—S. C. White Leghorns .....634 "
" 0—S. C. White Leghorns .....632 "

The five highest pens for June laid approximately seven eggs less each in June than in May, which is partly accounted for by May having thirty-one days and June only thirty.

The five highest pens for June are as follows:

Pen 6—S. C. White Leghorns .....115 eggs

ARTHUR W. BISHOP, PATERSON, N. J.

" 2—S. C. White Leghorns . . . . . .110 "
" 0—S. C. White Leghorns . . . . . .110 "
" 10—S. C. White Leghorns . . . . . .106 "
" 9—S. C. White Leghorns . . . . . .106 "

Of the five highest hens for eight months, two are Leghorns, two are Rocks and a Wyandotte and Rhode Island Red tie for fifth place. They are as follows:

Pen 4—Hen 4—S. C. White Leghorn . . . . . .190 eggs
" 14—Hen 3—S. C. White Leghorn . . . . . .168 "
" 40—Hen 1—Barred Rock . . . . . .160 "
" 34—Hen 3—Barred Rock . . . . . .155 "
" 23—Hen 2—Buff Wyandotte . . . . . .150 "
" 43—Hen 4—S. C. Red.150 "

Pen 6—S. C. White Leghorns, won the cup for June by laying 115 eggs.

The total egg yield for June in the Missouri Contest was 4,055 eggs.

* * *

Five of the ten highest pens in the National Contest remain the same as in May.

The record of the ten highest pens for eight months follows:

Pen 21—S. C. White Leghorns. England . . . . . .665 eggs
Pen 1—S. C. White Leghorns, Pennsylvania . . . . . .613 "
" 43—White Orpingtons, Wisconsin . . . . . .599 "
" 75—R. I. Whites, Ill. .597 "
" 3—S. C. White Leghorns, Pennsylvania . . . . . .564 "
" 19—S. C. White Leghorns, England . . . . . .562 "
" 29—S. C. Black Leghorns, Georgia . . . . . .557 "
" 5—S. C. White Leghorns, Illinois . . . . . .543 "
" 74—S. C. Reds, Penna.534 "
" 16—S. C. White Leghorns. Pennsylvania . . . . . .532 "

Only one of the five highest pens for May holds a place in the five highest pens for June. They are as follows:

" 16—S. C. White Leghorns, Pennsylvania . . . . . .94 eggs
" 14—S. C. White Leghorns, Kentucky . . . . . .92 "
" 12—S. C. White Leghorns, Texas . . . . . .81 "
" 10—S. C. White Leghorns, Pennsylvania . . . . . .80 "
" 5—S. C .White Leghorns, Illinois . . . . . .80 "

The five highest hens for June are given below. As will be noted, there are two Leghorns, one Orpington, one Rhode Island Red, one Rock and one Wyandotte, a Wyandotte and Leghorn tieing for fifth place:

Pen 43, Hen 277—White Orpington, Wisconsin. . . .184 eggs
" 67, Hen 412—Barred Rock Illinois . . . . . .160 "
" 21, Hen 129—S. C. White Leghorn, England. . . . .156 "
" 1, Hen 2—S. C. White Leghorn, Pennsylvania. 143 "
" 74, Hen 466—S. C. Red Pennsylvania . . . . . .139 "
" 57, Hen 514—White Wyandotte, England. . . . . .139 "

Pen 16—S. C. White Leghorns, Ashland, Pa., won the cup for June by laying 94 eggs.

The total number of eggs laid in the National Contest for June was 3853.

STORRS AGRICULTURAL EXPERIMENT STATION

Report of the Egg Laying Contest for the Month of June

The total yield of all pens in the laying contest at Storrs during the month of June amounted to 17,536, which is 741 eggs less than the production of May but relatively 484 more than for June a year ago. Thus the birds in the present competition are 3,376 eggs ahead of the corresponding date last year. The table below furnishes a comparison for the first eight months between the present competition and its predecessor showing as it does the best pens in the breeds named together with the average for all pens:

Breed	1914	1915
White Wyandottes. . . .	1444	1382
Rhode Island Reds.	1185	1363
White Leghorns.	1394	1294
Experimental Pens.	1406	1251
Plymouth Rocks.	1113	1138
Average pen score—all breeds	954	988

The ten best individuals to date are as follows:

Barred Rock No. 3, B'kf'd, Conn. . . . . 176 eggs
White Wyandottes, 132, Catforth, England . . . . . 172 eggs
R. I. Red, 261, St. Albans, Vt. . . . . 172 eggs
Wh. Wyandotte, 151, Columbia, Conn. . . . . 167 eggs
Wh. Wyandottes, 142, Hoghton, Eng. . . . . 165 eggs
R. I. Red, 420, Bridgeton, R. I. . . . . 164 eggs
R. I. Red, 344, Temple, N. H. . . . . 164 eggs
Barred Rock, 21, Mt. Carmel, Conn. . . . . 164 eggs
Wh. Wyandottes, 993, Stillwater, N. Y. . . . . 164 eggs
Barred Rock, 23, Mt. Carmel, Conn. . . . . 163 eggs

The experimental pens all taken together laid 1724 eggs during June or an average of 17 1-4 eggs per hen. Although this is a quarter of an egg per bird less than the competition average for the month, nevertheless the experimental birds have laid to date 1,008 eggs per pen as compared with the contest average of 988 a difference of 20 eggs in favor of the hens that are being fed milk experimentally. The subjoined table gives the total yield of both the milk and no milk pens. It will be noted that the total production of the pens receiving milk is now 575 eggs in excess of the check pens.

Breed	Pen	No Milk	Milk
Barred Rocks. . .	5 & 6	768	1176
W. Wyandottes	19 & 20	937	1102
Light Brahmas.	45 & 46	748	776
R. I. Reds.	37 & 38	1182	1024
White Leghorns	59 & 60	1119	1251
Total		4754	5329

RILEY SAYS

July "Everybodys" was the best Poultry Magazine ever issued. Everybody else knows that, too.

NO, SIR!

We did not hear from as many Poultry Association Secretaries as we hoped for, but then, the weather has been warm and while the young are growing, there is not much time for or interest in meetings. But our offer holds good and we expect to hear from you all in due time.

PRIZE SILVER CUP

For every association that will send us 25 subscriptions at 25 cents each. These beautiful cups are just what your association needs to draw a big entry and any exhibitor will be glad to win it. Our

PRIZE CONTEST

is the feature of the season; it is not too late for you to enter this contest now. Try for one of the Grand Prizes. A grafanola in your home will be, next to your family and your chickens, your most valued possession.

EVERYBODYS

Poultry Magazine interests the whole family; just mention it to your friends, that's all.

IN THE GOOD OLD DAYS

Under this head we will monthly publish a select line of articles published years ago that are of special interest to the breeders of this age. We also ask for contributions for this department either in Books, Poultry papers or in Manuscript form.

UTILITY NOT THE HIGHEST VALUE

(The Poultry World 1872)

"A thing of beauty is a joy forever." We are not getting ready reader to sentimentalize over fine poultry, but if a Golden Spangled Polish fowl is not as robust in constitution as a breed of plainer feather; if a dainty elegant Bantam won't fill the baking dish like some clumsy cockerel, and if a Hamburg with beautiful wing bars lays no better than one without, still these matters of fancy are quite as important as the grosser ones of appetite and pocket. What do people run after most the world over? The savage travels miles and barters his worldly all for the possession of some bauble that catches his eye. The most civilized person spends a fortune on little elegancies. Half the trades and callings of men are to minister to the love of ornament. Every article of dress and furniture costs more than it would if not made with a view to look as well as use. Is it foolish to indulge in a flower garden near your dwelling? But the tints of plumage upon fancy fowls are almost as bright and varied as those of flowers. Oh, neighbor Hard-pan you may turn up your nose at exhibition birds, but stars, leaves and plumes have been called beautiful since there was such a word in any language. The neck hackles upon the "red rooster" of Burton Briggs' ranch are so delicate and graceful that a prince would give a purse of gold for them were they not so common.

STANDARDS DELIVERED

All orders for the Standard of Perfection placed with Everybodys were mailed out July 19th, the day the books were received at this office. We make this statement in order that our readers may know that we appreciate the fact of their anxiety in receiving the Standards they had ordered, as well as to show the promptness of our Book Department. It shall be the policy of Everybodys to be prompt in the delivery of all orders placed with us for books, as well as in filling all orders from our clubbing offers. We will appreciate your writing us if for any reason your order does not reach you within reasonable time after being sent us.

Will You Do This?

When writing advertisers, mention "Everybodys." Thanks.

SHOWS and ASSOCIATIONS

Progress appears to be the watchword of our present day specialty clubs, and each year shows strides forward along all lines of club work.

The bulletins and year books being issued by the different clubs contain much valuable information and should be in the possession of the respective fanciers of all varieties of pure bred fowls.

In this Department of Everybodys, we hope to familiarize our readers with items of interest pertaining to the different specialty organizations, thus creating a new interest in the various clubs and the work they are doing.—Editor.

MILWAUKEE POULTRY SHOW

Milwaukee Auditorium Poultry Show, Milwaukee, Wis., January 21st to 26th, inclusive, 1916. Judges: Tucker, Pierce, Kummer, McCord, Hackett, Greenwood, Wells. Others may be added.

Premium list ready December 10th. Theo. Hewes, Secretary, 25 1-2 W. Wash. St., Indianapolis, Ind.

CORRECTION

July 14, 1915.

To the Editor of Everybodys Poultry Magazine, Hanover, Pa.

Dear Sir—In my recent article, which appeared in the July number, I notice a clerical error which, when observed by you I believe should be corrected. I have received a number of communications in regard to this misprint and, therefore, am gratified to learn that somebody reads my articles.

On page 258, 2d paragraph, I am reported to have said among other things, "I can count on the fingers of my hand the number of communications I have received from my constituents with reference to their wives on great questions, etc."

I did not intend to pry into the domestic life of any of my friends or to open any closets in which there might be skeletons! I have no doubt that such communications would be most elevating and delightful, but at the time I was not intending to draw the ladies into the discussion. I have received a communication from Dr. Woods, in which he says, "What the blazes do you expect poultrymen to write about their wives? What did five of them write you?"

By striking out the word "wives" and substituting the word "views" I think my ideas in general will be better conveyed. If you will kindly make the correction I feel sure you will cut down my correspondence and perhaps shield me from consequences which might be very grave.

Yours very truly,
CHAS. D. CLEVELAND.

Ed. Note—We greatly regret the error Mr. Cleveland refers to, and hope it won't happen again. Our proof reader, like the rest of us, is only human, he was married June 20th, so there is some excuse for this error.—H. P. S.

CHICAGO COLISEUM SHOW

Coliseum Poultry Show, Chicago, Ill., December 10th to 15th, inclusive, 1915.

Judges: Shellebarger, Wells, Greenwood, Hackett, Tucker, Campbell, Whitney, McCord, Johnston, Pierce, Shillings, Kummer, Pickett, Rownsley, Clarence Hewes.

Premium list ready November 1st. Theo. Hewes, Secretary, 25 1-2 W. Wash St., Indianapolis, Ind.

* * *

NEW YORK STATE FAIR

The prospects of a record exhibit of all varieties of poultry and waterfowl at the coming New York State Fair is most excellent. Breeders from all parts of the country realize that a winning at Syracuse is without equal and further realize that many prospective buyers are governed largely by the awards hung up at Syracuse. Also many a bird is bought ere Syracuse and the big winter shows. Superintendent Manning has secured 21 of our best judges and in addition to liberal prize money of $3, $2 and $1 with a 50c entry there is also offered over $1,300 in cash specials.

The new poultry building is without equal in displaying a poultry exhibit. The light and ventilation is faultless. If you have not already done so, write Mr. W. H. Manning, Supt., Saratoga Springs, N. Y., at once for a premium list and plan to send at least a few birds. Entries close August 25th. Be sure your entry is in on time. A winning at Syracuse will do much towards your success.

There is no place where you can place your birds before more interested people than at the New York State Fair from September 13th to 18th.

* * *

ALLENTOWN FAIR AGAIN ENLARGES ITS POULTRY BUILDING

At the June meeting of the executive board of the Great Allentown Fair, Allentown, Pa., it was voted to greatly enlarge the main poultry building by adding an addition along the entire north end. This is the third time the building accommodations have been enlarged in the ten years that Superintendent W. Theo. Wittman has been in charge and although Allentown Fair the last few years has had buildings and accommodations for its poultry show equalled by few, after the new addition is complete it will again stand at the head. Allentown Fair Poultry Show has for years used as its motto "Noted For the Way It Does Things and the Things It Does," and it has fully lived up to its slogan, having through Supt. Wittman introduced many innovations now in common use by many Fall and Winter Shows.

Always a leader and being the biggest fair east of the Mississippi River it is likely that among other new features the fair hereafter will be open evenings and probably continue for ten days. Allentown and the surrounding territory is entirely unaffected by the hard times and the fair is sure to exceed its past records for greatness this year.

* * *

AMERICAN CAMPINE CLUB TO MEET AT CHICAGO

We are just in receipt of a letter from Mrs. Chas. H. Owings, Dumont, N. J., secretary of the American Campine Club, advising us that the club have voted to hold their annual

"Everybodys" Illustrated Ads.

EVERYBODYS ILLUSTRATED ADVERTISEMENTS.——Under this heading we give you a forty (40) word ad. with a small sized illustration (to be furnished by us) for $2 per month, for less than one year, or for $20 per year, payable quarterly in advance. These rates are net. Words in excess of forty, five cents extra per word per month. Numbers and initials count as words. New copy, plainly written should reach us by the 18th of the month preceding date of issue. Change of copy should reach us by the 10th of month preceding date of issue. Always Mention Everybodys.

WOODS LIGHT BRAHMAS for the Season of 1914-15 won Three Firsts at the New York Palace Show. Three Firsts and Best Display at Chicago. Four Firsts at New York State Fair, also winners at M. S. Garden, New York, Allentown, Paterson, etc. Splendid exhibition and breeding birds for sale now, with satisfaction assured. Address Harvey C. Wood, Box E, Bound Brook, N. J.

WARDS CHAMPION DARK Cornish Fowls have the habit of winning wherever shown. Their records made at New York, Chicago, Hagerstown, Buffalo, Allentown and other leading shows is history. A grand lot of youngsters coming from this season's winners, write me your wants. John W. Ward, Jr., Box E, Pennington, N. J.

SILVER LACED WYANdottes. A reliable breed, one of the oldest and best we have. If you breed them you will have that satisfied feeling. Just like you are sure to have after reading "Everybodys." Try one of these little Illustrated ads; they pull like sixty.

BIRD'S BRONZE TURKEYS are America's Leading Strain. The champion winners of the age. Our Partridge Rocks have also won at the largest and best shows, east and west. 500 birds of each variety for sale. We can supply your wants to your full satisfaction; write us today. Bird Brothers, Box J, Myersdale, Pa.

THE HOMESTEAD CAMpine Farm, Wayland, Mass., breed the Vigorous Strain of Silvers. We offer you at this time and at special prices reliable bred stock. Mated trios and pens a specialty. Write us your wants and let us quote prices. If you wish winners, we have them.

SINGLE COMB BLACK Minorca Breeders, and all breeders and fanciers alike will read your ad in "Everybodys." This new department should take well. You try it and see for yourself. We are making business for others. Why not you? Come, write us now, Today.

WHITE RUNNER DUCKS, the World's Greatest Layers. I now offer you stock from my famous winners for breeding and exhibiting, have a large quality stock of special breeding worth. If you don't breed Runners, you are missing something. E. G. Curtis, Atsion, N. J.

SINGLE COMB WHITE Leghorns. Winners at Buffalo's Great Show and at many others. My birds are line-bred with that winning quality and also with the "Laying Habit." I can now fill your order for fine stock at reasonable prices; write your wants. Albert Waldron, Titusville, Pa.

WHITE WYANDOTTES OF Superior Shape, fine heads, strong eyes and the purest of color are features of my strain. They also combine particular practical qualities. I have the stock now and can fill your order to your satisfaction. Write Fred C. Lisk, Box E, Romulus, N. Y.

BLACK & BUFF ORPINGtons. I am now offering for sale my entire stock of birds without reserve. Here is your opportunity to buy New York winners and stock bred from them. Don't delay, write now. L. O. Kettering. No. 966 Liberty Ave., Pittsburgh, Pa.

ORCHARD FARM REDS.—"The Winning Strain" in both Single and Rose Combs. We have birds that will win many of the honors this coming show season, so if you wish to be in line, write us your wants, we will please you as well as "Everybodys" does. Address, Orchard Farms, Box E, Noroton Heights, Conn.

meeting with the Coliseum Show, December 10th to 15th, 1915. This is one of the strongest specialty clubs in the country, and this meeting will undoubtedly bring out one of the largest entries ever caged anywhere in the United States.

The big specialty clubs of this country are not slow in noting the liberal premiums and high class judges employed with the Coliseum Show, and each year we see their number increase. For 1915 we have the following clubs:

American Campine Club, A. O. Schillings, Judge.

American White Orpington Club, Leonard Rownsley, Judge; Wm. A. Stolls, State Life Bldg., Indianapolis, Ind., secretary.

American Sussex Club, A. O. Schillings, Judge; Frank L. Platt, Swanton, Ohio, secretary.

American Buckeye Club, H. A. Pickett, Judge; A. H. Weisburg, Nevada, Mo., secretary.

Mid-West Bantam Association, T. M. Campbell, Judge; R. A. McKinney, Indianapolis, Ind., secretary.

Premium lists of the Coliseum Show ready for mailing November 1st. All club members and others interested should have their name enrolled with the secretary at once.

Address all communications to Theo. Hewes, Secretary Coliseum Show, 25 1-2 W. Washington St., Indianapolis, Indiana.

* * *

Secretary L. D. Howell, of the New York State Branch of the American Poultry Association, has made a call for a meeting on Wednesday, September 15th, at 2 p. m., this to take place in connection with the New York State Fair. Mr. Howell urges as many members as possible to attend this meeting as many matters of interest will be taken up.

The Official Club Book of the American White Orpington Club is another interesting review of the doings of this representative variety of the Orpington family. Mr. E. B. Regers, the president, in his message, plainly wishes it known that all members are invited to join hands in the clubs' interest, impressing them that this is no one man's organization and all should boost.

Springfield, Mass.,
July 7, 1915.

Everybodys Poultry Mag. Pub. Co.,
Hanover, Pa.

Gentlemen:

Yours of the 3rd received.

The copies of Everybodys for July arrived safely. The issue is a "Top Notcher" and no one, I am sure, would call you the least bit conceited if you were caught patting yourselves on the back over your achievement.

Yours truly,
F. H. BELDEN, JR.

RESULTS OF AMERICAN CAMPINE CLUB ELECTION

Election of officers of American Campine Club for year 1916, which ballots were counted and recorded at the office of the Secretary, Mrs. Chas. H. Owings, Dumont, N. J., July 8th, 1915, resulted as follows:

President, M. R. Jacobs, Ridgefield, N. J.; first vice president, N. E. Luce, Glendale, Cal.; second vice president, Dr. J. H. Prudhomme, Thurmont, Md.; secretary-treasurer, Mrs. Chas. H. Owings, Dumont, N. J.; executive board, C. A. Phipps, Wayland, Mass; S. V. R. Martling, Ridgefield, N. J.; Mrs. A. A. Carver, Seville, Ohio.

The Coliseum Show at Chicago has been selected as the place for annual meeting and club show, December 10-15, 1915.

The above officers will be installed at the coming annual club meeting which will be held at the Coliseum Show in December, as per results of above election.

The American Buff Wyandotte Year Book for 1915 is a vast improvement over any previous publication as yet sent out by this wide-awake organization. Printed on elegant quality paper, well illustrated and containing much that will please the fanciers of this popular member of the Wyandotte family.

* * *

The Third Annual Poultry Show of the Fairfield Co. Poultry Association, Lancaster, Ohio, will take place January 4th to 8th, 1916. Mr. Thomas Baus, secretary, would be pleased to place your name on his mailing list. Address him at Lancaster, Ohio.

* * *

The next show of the Elizabethtown, Pa., Poultry Association will be held at that place on January 5 to 8 next. Mr. C. R. Reese who has charge of the publicity of this organization, writes us that Geo. H. Brown has been engaged as judge; also that the next event will be the banner show in their history.

* * *

The American Royal Poultry Show have announced that (Convention Hall) Kansas City, Mo., has been selected as the place for holding their next exhibition on October 4th to 9th.

This is one of Missouri's largest exhibitions, as well as largest attended shows in that state. The superintendent and manager, Thos. W. Southard, will be pleased to give information pertaining to same, as well as placing your name on mailing list.

* * *

The 1915 American Cornish Club Annual certainly did create some sensation sure enough. The Annual showed 294 paid up members, but during May and June 42 new names were added, bringing the total membership of this hustling specialty club up to 336 members on July 1st, 42 new members in 61 days isn't bad. That's a new one every day and a half.

The club will have a big meet at San Francisco in November, a great big one, and for the Eastern members who cannot attend special arrangements have been made to have a big 'Eastern Breeders Meet of Cornish at the Palace in New York to which all are cordially invited. The club has nothing to do with the latter officially, but the idea is with Mr. Howell, to catch those who cannot get to the coast because of the distance and

the overflow from the coast.

The August Bulletin is promised for next month with some real good news, an article or two, and some light catchy stuff for summer thoughts, for we want something to think about in the summer.

The Bulletin will also contain a list of those new members who have joined since the Annual was sent out.

With membership but $1.00 per year all breeders of Cornish should certainly join the club. The Annual sells for 50c this year and contains 120 pages and fifty cuts, but the book is free with membership. Address John W. Ward, Jr., National Sec'y-Treasurer, Pennington, N. J.

* * *

THE TRI-STATE FAIR AND EXPOSITION

All indications point to one of the most successful fairs ever held in Memphis, and the gathering of poultry from all sections of the country, together with the many other special features of equal importance will make the fair this year better and bigger than ever before.

The gathering of fancy poultry at the Tri-State fair is always a very notable feature, as some of the best the country affords will be here.

The coming show to be held in connection with the Tri-State Fair, Sept. 26-Oct. 5, will be the largest ever held in this section. You are invited to enter your best birds for exhibition. All prizes paid in gold.

The Tri-State Poultry Association was organized 25 years ago with a membership of 30. The first show held staged 250 birds. The association now has 136 members, representing 13 states, and the last show, held in connection with the Tri-State Fair (1914) had on exhibition 2,850 birds.

Every poultry breeder in Tennessee, Mississippi and Arkansas should be a member of the Tri-State Poultry Association.

A SURE WINNER

Penbrook, Pa., May 4, 1915
Everybodys Poultry Magazine,
Hanover, Pa.

Gentlemen:—Enclosed find my check covering the cost of my breeders card for one (1) year. Your magazine sure is a winner.

Yours very truly,
S. W. BRIGHTBILL

Fanciers: Exhibit your birds this year at the Greater Buffalo Show, Thanksgiving weke November 22 to 27, 1915. Buffalo Show ranks as one of the four leading Poultry Shows of America. Its early date and large daily attendance of poultrymen makes it the Big Selling Show of the season. Increase your sales by exhibiting with us. Percy Cook, well known Orpington breeder writes: "An excellent show for sales and our winnings at it brought use a great deal of business." Buffalo has half a million inhabitants, is within a night's journey of over thirty-two millions of people, making it convenient for a large number of Eastern, Western and Canadian buyers to attend.

Reasonable entry fees. Thousands of dollars in regular and special prizes.

For information and copy of premium list, address, Wm. O. Jennings, Buffalo, N. Y.

We wish to call to the attention of our readers the advertisement of the Maplewood Poultry Yards, Attica, N. Y., on another page of this issue. This plant breeds S. C. White Leghorns are making a special offer on choice females. M. H. Richards, Mgr., and L. M. Ritenbaugh, Supt., lay special stress on the quality of the birds they are now offering for sale. Write them for further information regarding the stock offered.

Diamond Box Co., Minneapolis, Minn., are regular advertisers in Everybodys.

The faith they show in their product is evident by their offering the poultrymen a free sample of the Diamond Egg Box. Write them today and see for yourself the safe shipping qualities of this carton.

J. T. H.

H. K. Brunner, Dept. A, 45 Harrison St., New York, are new advertisers in Everybodys. Read their ad. on another page of this issue, and write them regarding their new Flats and Fillers Egg Cases, etc.

J. T. H.

QUESTION

Anybody using "Everybodys" ads if you wish for a testimonial of their value.

KEYSTONE POULTRY FOUNTAINS. YORK, PENN'A.

The Keystone Fountain in Grey Granite Finish as advertised in this issue is a new departure in the finish of drinking vessels for poultry and is a step farther toward perfect sanitation in this respect, as it is hard to conceive of any coating for metal that would be more sanitary than a Granite Finish, which is now being used on Keystone Fountains. This finish meets all the advantages of earthen vessels and still retains the very important features of the metal one, in that the pan is hinged to the tank and is constructed to be hanged above the floor or ground so that the water is kept clean. Drugs can be used in the water when desired as they will not affect the finish. The poultry raiser and in fact anyone who has poultry will no doubt appreciate this up-to-date device for the reason that it fills a long felt want and provides the most sanitary as well as the most practical way of keeping water before poultry. As a device for watering pets, such as dogs and cats, it is also the most desirable yet offered. Mention Everybodys when writing them.

A SPLENDID CATALOG

One of the most artistic and convincing catalogs that has come our way for a long time is that of the Wilburtha Poultry Farms, just issued. It is a credit to the owner, Mr. Chas. J. Fisk, whose work as a breeder and exhibitor is known the country over.

Remember this, that a catalog is like a store window or counter display—it reflects on the business capacity of the proprietor. The atmosphere of Wilburtha's model poultry plant runs all through this book. The photographs are excellent. They show in detail the type and conformation of Wilburtha's great winners—S. C. White and Buff Leghorns, Columbian Wyandottes and Columbian Plymouth Rocks. The buildings, equipment and methods are splendidly described and illustrated.

Some of the biggest helps to prospective buyers are the suggestions as to which birds to purchase and what price to pay. Both the price list in the book and the mating list enclosed in it are of great help in this way.

Wilburtha's property has interesting historical connections which the book describes. Wilburtha birds have carried off honors at the biggest shows for several years, the winnings are shown in detail. The book combines these and makes the whole subject most interesting. It is more than a catalog.

"Buy our stock and make a name for yourself," is the selling slogan of Wilburtha. A glance through the book shows why you can win.

"Come and pay us a visit," is the constant invitation. The book is so well illustrated as to bring the farm right to you. The catalog is free. If you are a breeder or intend to be, send for it. Remember the address, Chas. J. Fisk, owner, Wilburtha Poultry Farms, Trenton Junction, N. J.

J. T. H.

WE THANK YOU

For mentioning "Everybodys" when you write our advertisers.

Homestead Campine Farm Catalog, while a little late in reaching the admirers of the "Vigorous Strain," as bred by Mr. C. A. Phipps, of Wayland, Mass., more than compensates for the delay in publishing, in that in a concise and interesting manner Mr. Phipps tells his readers something of the merits of the Campines as bred at Wayland.

The illustrations are so true to life in showing the remarkable birds, as bred there, together with the descriptions of these same birds by authorities who know, making this catalog interesting indeed. We urge all Campine lovers to write the Homestead Farm requesting a copy of this book and believe that by this you will become better acquainted with this line of stock. Address them Box H-2, Wayland, Mass.—J. T. H.

Mt. Bethel, Pa.,
July 16, 1915

Everybodys Poultry Magazine,
Hanover, Pa.

Gentlemen:

From the ad. I had in Everybodys for July I have received to date of July 12th inquiries for over 500 birds. Enclosed please find remittance to cover my ad. and good luck to you.

Very truly yours,
HIDRI VIEW POULTRY FARM,
Jos. R. Nichols, Owner.

"EVERYBODYS POPULARITY"

I appreciate your good attention given and it seems to me that your magazine should forge ahead very fast as I think it is most interesting and, indeed well published. Your mention of my Boston winners seems to have made an impression, for we have had several inquiries and some sales on the strength of it.

Very truly yours,
C. A. PHIPPS, Wayland, Mass.
Homestead Campine Farms.

* * *

Have just been reading Everybodys Poultry Magazine and I want to compliment you on the very nice issues you have put out. I feel sure with this magazine in your hands, that you are bound to make it a decided winner. There is no question but what is is a very fine looking paper and contains many articles of value for you have some very high class contributors.

Wishing you every success in your capacity as editor, I beg to remain

Truly and sincerely yours,
W. C. PIERCE, Hope, Ind.

* * *

Let me compliment and congratulate you on your July and other issues of "Everybodys." Believe me when I say to you that your magazine in my opinion will lead them all in a very short time. Good luck to you and with kindest regards to Graham, Wolsieffer and all interested, I remain

Very truly yours,
C. F. RANKIN, Pittsburgh, Pa.

* * *

You certainly have every reason to be proud of the past issues of "Everybodys." We know that in your most competent hands further success awaits your magazine.

Yours very truly,
F. G. COOK, Supt.,
Grove Hill Poultry Farms, Waltham, Mass.

* * *

Your good magazine has been gratefully received and I have enjoyed reading your spicy articles very much. Find check herewith for three years' subscription.

Yours truly,
C. R. BAKER, Abilene, Kans.

* * *

"Everybodys" at hand regularly, it is some magazine and you put the real "Pep" into it as was expected. Accept my congratulations and best wishes for your and for "Everybodys" success.

H. H. COBURN, Marysville, Mich.

* * *

Your July issue was certainly a fine one, all your issues have been of the best, but your July issue was the best poultry magazine I have ever seen. You will surely get the subscribers with the quality you are giving.

Very truly and sincerely,
HENRY D. RILEY, Strafford, Pa.

Mr. Rufus Dalafield, owner of the Sunswick Poultry Farm, South Plainfield, New Jersey, informs us that he is about to offer for immediate sale two thousand S. C. Buff Leghorns. These include all of his grand flock of this year's breeders in addition to his young stock. Everyone acquainted with the famous Buff Orpingtons of "Sunswick" know that Mr. Delafield would not tolerate anything but the best on his farm and that the Leghorns he is offering for sale must also possess the same high quality as the Orpingtons which have made "Sunswick" famous.

We do not hesitate to recommend to anyone desiring Buff Leghorns the birds here offered, knowing that in every instance the bargains will please and the stock offered will be of superior breeding and commercial value.

Write Mr. Delafield today and ask him to quote you prices on any number you may desire, either single birds, pairs, trios, pens or for the lot.

"Oculum" has met with the approval of many of America's leading poultrymen and its merits have been proven beyond dispute. Much prejudice is always apparent in regard to so-called "cure-alls," but here is a preparation which our most successful breeders are not only using, but are recommending to do all that is claimed by its manufacturers, the H. I. Co., Salem, Va. J. T. H.

MR. QUISENBERRY PLEASED WITH "OCULUM"

Mountain Grove, Mo.,
May 31, 1915

H. I. Co., Inc., Salem, Va.

Gentlemen—We have tried out the "Oculum" on several pens and find that it has benefitted them very much in regard to their general health.

Missouri State Poultry Experiment Station,
M. L. QUISENBERRY, Asst Secy.

Library, U. S. Dept. of Agriculture

and all other large shows. 1,000 of the finest youngsters ever produced. They will be among the winners at the hottest shows. No competition too keen. All birds shipped on approval, and money refunded if birds is returned; but they don't come back.

WEST MOUNTAIN POULTRY YARDS, F. B. Williams, Prop. Box B NAUGATUCK, CONN.

RED SUSSEX

Egg prices reduced this month. Sussex chickens have been hatched in the fall for years in England, to be ready for the fattening sheds the following spring. When given a place by themselves the birds grow rapidly. I usually have stock of all values for sale at reasonable prices. Some utility yearlings at this time. Late chickens of this breed do unusually well. Booklet free.

F. L. Platt, Swanton, Ohio

BUILD IT YOURSELF
FROM OUR SIMPLE
BLUE PRINT PLANS

The "DIAPHRAGM"

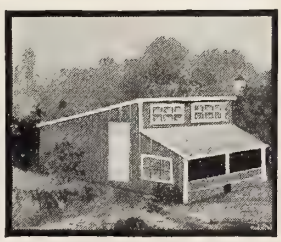
Automatic Fresh-Air Suction Poultry House is one of the greatest discoveries ever made in the construction of poultry houses. Embodying all the best features of other houses, it also offers something entirely new in having a roosting compartment into which fresh air is forced automatically by the fowls themselves. No matter how many fowls are on the roosts the air will at all times be absolutely pure, thus preventing disease. It is a well known fact that nearly all the different diseases develop during the cold and damp nights, while the fowls are sitting still on the roosts, because sitting directly above the dung they breathe the germ-laden air over and over again, especially where there is a drop curtain in front of roosts. One of the best features which we claim for our house is that **double the number of fowls can be kept in a house equipped with a "DIAPHRAGM"** than are usually kept in a house of equal size, for the greater the number of fowls on the roost, the greater will be volume of fresh air rushing in and expelling the foul odors.

Designed by Louis A. Stahmer

Equip Your Old Poultry House with a "DIAPHRAGM" —It Costs But Litlle to Build

Complete specifications accompany each plan. All measurements are in plain figures, no technical architectural terms used. If you can handle hammer and saw you can build any one of these open air poultry houses from our plans.

Dr. Woods' Open-Air House with Diaphragm Roosting Compartment



THE DIAPHRAGM HOUSE

Plan No. 2 gives complete specifications and measurements to build this 8 ft. by 16 ft. model No. 1 or 8 ft. by 12 ft. model No. 2 house. The most scientifically built poultry house.

DIAPHRAGM HOUSE
Model No. 2

WOODS' OPEN-AIR HOUSE

with diaphragm roosting compartments. Plan No. 3 gives complete information to build this most popular house. Thousands of them in use all over the country. Size: 8 ft. by 16 ft.

Anybody Can Build from Our Simple Blue Print Plans

PLAN No. 1 will enable you to build an 8' by 20' diaphragm house or one section of a continuous house. It also shows drawings for model No. 2, 8' by 13½' building.

PLAN No. 2 shows the drawings for an 8' by 16' diaphragm house or one section of a continuous house. It also shows drawing for an 8' by 12' model No. 2 house.

PLAN No. 3 gives complete information to build an 8' by 16' Woods' open air house with diaphragm roosting compartment or for one section of a continuous house.

All these houses have been endorsed by America's foremost fanciers and have given universal satisfaction under all conditions. These plans are for sale at our office and we will send any one of the above complete plans and specifications for $1.00 or with subscription to the

BASKETS OF EGGS

In Order to Long Succeed the Profitable Production of Eggs Strict Attention Must Be Given To Quality—By Willard C. Thompson.

IN AMERICA today the great majority of farmers are turning their efforts toward intensive production more and more every season. The growth of the cities, with their thousands of consumers, and the gradual decreasing of the size of farms, due to many economic conditions, means that lines of agriculture must come into play that have possibly been neglected or unknown in past years. One of the biggest farm crops that has been a result of this movement is the egg crop. Millions of dozens of eggs are required every day to supply the demand for this kind of human food, a food that is looked upon as an absolutely necessary part of the diet nowadays All kinds of eggs are put upon the general market, eggs that have been carefully produced and as carefully marketed, and eggs that have been carelessly handled throughout, eggs that are unfit for human consumption, at least for the careful and critical person. The necessity of greater care in the production and marketing of table eggs is being realized more keenly by people in the business every day. It not only means the insurance of a better product for the consumer, but it means greater profits for the producers; a consuming public will not long accept poor quality eggs at high prices. They are willing to pay for eggs of guaranteed quality. The farmer, or poultryman, that has learned the little points which build up the quality of market, or table, eggs is the one for whose eggs there is bound to grow a constant and paying demand. With keenness in competition steadily advancing success is going to come to the producer that furnishes more nearly what the consumer wants. It is one of the cardinal factors in the building up of such a specialized line of agriculture as egg production really is. Improving the quality of eggs is accomplished by three things: 1st. The bettering of the laying stock. 2nd. The more careful handling of the eggs before sending to the market, and 3rd The selection of suitable, practical and attractive packages and methods of marketing.

WHAT IS QUALITY IN EGGS

Quality in table eggs includes all the characteristics that make eggs attractive, economical, healthful and nutritious food. In order to fulfill these requirements they must possess certain characteristics that are influenced either one way or the other by the kind and condition of bird producing and by the care and management given to their production and handling. Quality should increase the value of the eggs, not only from the standpoint of the person using them, but also from the standpoint of the person producing them. It is because the quality of eggs affects every party concerned that it becomes one of the controlling factors of the business.

Of all the important characteristics that go to make up high quality in market eggs there is none of greater importance than the freshness of the article. Eggs, more, perhaps, than many other common farm products, must be fresh, if they are to be acceptable for table use. With each passing day after the egg has been laid its degree of freshness diminishes and its quality decreases. The perfectly fresh egg has an air-cell at the large end of the egg that is approximately one-eighth of an inch or less in depth. With age this air-cell enlarges, due to the evaporation of water through the shell and membranes of the egg. Such evaporation decreases the value of the egg. Heat increases such losing of water, and this is one of the effects of storing eggs in a warm room. If the eggs have been produced in pens in which the male birds have been allowed to remain, the vast majority of eggs will have been fertilized. Fertile eggs do not "keep" as well as sterile eggs, eggs produced without the presence of the males in the pens. If warmth is supplied, altho not intentionally, the germs within the eggs may start to grow, some of them developing for several days before dieing. Of course eggs of such nature are classed as rots and are wholly unfit for human consumption. This is one effect of age on eggs. Eggs that are stored for considerable time after having been laid are subject to molds and bacterial action. These agencies cause thousands of rotten eggs and eggs with disagreeable odors and tastes. Some bacteria are present in every egg, it is thought, but the kind and number is not sufficient to cause injurious results, if care is taken in the production and handling of the eggs. Filthy nests and dirty fowls cause much of the infection of such destructive organisms. Holding eggs for any great length of time gives such molds and bacteria time to grow and develop and produce their poisonous gases and other by-products. Eggs are animal products, and like all animal products acquire a stale taste and odor with age. There is no egg that is fit and attractive for eating purposes as the strictly fresh egg. One of the first efforts, then, in the improvement of the quality of eggs that are to be

marketed is, or should be, toward maintaining the freshness of all products sold. Every carton or basket should have a guarantee of the freshness of the eggs stamped or printed upon it. It is usually the first question that the housewife asks when purchasing eggs. "Are they fresh." A guarantee of freshness is a stepping stone toward better prices.

How can freshness of eggs be insured? It is necessary to know just what can be done toward maintaining such a standard. In the first place greater care should be exercised in the gathering of the eggs. The old idea that anyone can gather eggs is erroneous and often the cause of "mistakes" in shipments of supposedly first-class eggs. Eggs should be gathered daily. Any eggs found in new nests that may have been laid for several days should be placed by themselves for private use and most careful candling. Only the new-laid eggs should be offered to the customers, whoever they may be. No chance can be taken that every egg found is all right. Know that it is new-laid. In winter time it may be necessary to gather eggs several times a day, to avoid freezing. Further, fowls should be induced to lay their eggs in regular places. This can be accomplished by furnishing them with clean, secluded nests in sufficient number. One nest should be allowed to every six or eight females, at least. If the nests are rather dark and protected from the light, the hens will appreciate them the more, and make use of them more contentedly and continually. It is noticeable that birds will nearly always select those that are secluded and quiet. After the eggs have been gathered still more care should be taken to insure their freshness and general quality. They should be candled. By candling is meant the examination of the eggs with regard to their content, without actually breaking the shell. It is an application of the x-ray as it were. A simple and efficient candling apparatus can be made of a shoe box and a small kerosene lamp. Remove the end of the box and set the lamp inside, pushing the whole thing against the wall or a box, so that as little light as possible gets into the room. Cut a hole in the bottom of the box opposite the flame of the lamp, large enough so that about three-quarters of the egg can be seen through the hole. The main source of light entering the eye, then, must come through the egg, if the room is practically dark. In this way clots of blood within the egg can be detected, the size of the air-cell, the best indicator of the freshness of the egg, can be determined, and any small cracks in the shell can be seen. The whole process does not take a great deal of time, and it enables one to save out from the market shipment all those eggs that are not first-rate quality. Where electric lights are to be procured more durable candling boxes can be constructed.

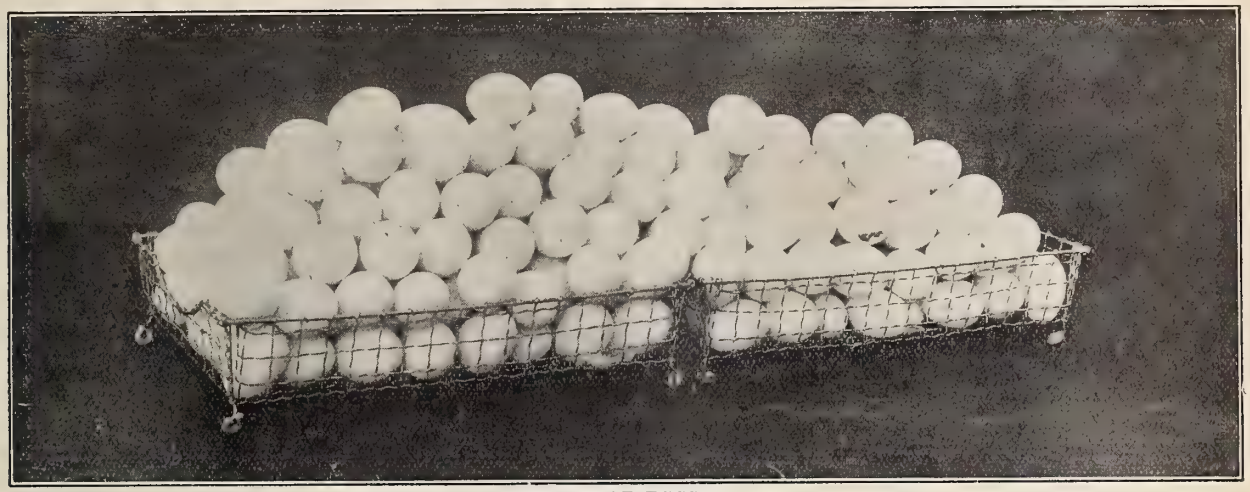
Do not keep eggs for more than a week before marketing, if you are anxious to maintain a reputation for fresh eggs. It is far better to market them when but a day or two old, if conditions are such as to make such a practice advisable and economical. Much will depend upon the number of eggs produced every day, and upon the market to which they are supplied. Specialized egg farmers can usually afford to market sooner than general farmers that only have a few eggs, relatively, each day. If it is necessary to hold eggs for a few days, they should be stored in a cool room. A room the temperature of which is about 55 degrees is most desirable, but this exact temperature cannot always be obtained. Coolness prevents much evaporation, holds back germ and mold development, and keeps the eggs in as near natural condition as possible. The delivery of eggs to market has an important effect on their quality. Heat destroys freshness, as has been said, and therefore, if eggs are delivered in open wagons and hauled over country roads in the hot sun, the temperature is high and, if long continued, destructive. Keep the eggs as cool as possible at all times. Deliver in covered vehicles, or at evening. Ship by fast means, thus cutting down the length of time on the road.

Next to freshness the most important characteristic that all market eggs should possess is uniformity. Uniformity has to do, primarily, with size, shape, color and shell. It is the attractive effect that uniformity gives eggs that makes it a most important factor in the handling of table eggs. It has no immediate effect upon the taste or flavor of the egg, nor upon its odor or smell. But the housewife likes to get eggs that are the same color. New York City has through many years become accustomed to

Pullets reared on ranges during the summer into big, healthy layers to help fill the winter egg baskets. Stock adds to quality in eggs.

Th old layers which are now getting ready for the coming winter will assist the pullets in heaping the egg baskets with a high quality eggs, if surrounded with healthy, clean quarters.

white shelled eggs until today that great market is universally known as a white-shell-egg market. Boston has likewise developed a prejudice for brown eggs. There are probably few, if any, differences between white and brown shell eggs, but the people in such cities as mentioned want a certain colored egg without mixtures of foreign color. The relation between a uniformly colored lot of eggs and freshness has come to be common among consumers, not that there is actually any relation between the two. A carton of eggs put upon the market consisting of some brown shelled eggs and some white shelled eggs is not attractive in appearance and does not look to many buyers as fresh as cartons of eggs of the same color. The egg buying public is a critical purchaser, and it is necessary to cater to its wishes. Never mix brown eggs and white eggs in the same carton or case. Appearances count for much in the business world, as elsewhere. Then, again, eggs should be sorted before sending to market with regard to size. All small eggs should be sent as seconds, or used for home consumption. Do not break down the otherwise attractive carton of eggs by including even one small, under-sized egg. This work of grading or sorting eggs can be done at the same time that the candling is made. When dozen cartons are used, strive to put into one carton eggs that are as near the same size, shape and color as it is possible to obtain. This presents neater, more attractive packages and indicates



BASKETS OF EGGS

Uniformity in color, shape, size and weight, freshness, cleanliness, evenness and sterility are quality marks in table eggs.

to the purchaser that care is being used in the handling and production of the eggs sold to him. When eggs are marketed all together, small ones, large ones, brown ones and white ones, and dirty ones and clean ones, the value of the really good eggs is pulled down by the presence of others. A few minutes spared at the farm in sorting and grading the day's eggs brings in greater profits and proves a great advertising value in the building up and development of a demand for those eggs. All this talk about being careful with regard to uniformity is not idle theory, but it is practical common sense.

The size of market eggs is an important quality that is necessary to the development of private trade and to the suiting of the commercial egg handlers. Pullets and under-fed hens tend to produce small-sized eggs. Prevalence of undersized eggs injures the producer's reputation. The housewife wants an egg that has a normal sized yolk and a good supply of albumen, or white part. Small eggs are usually lacking in the latter. The size of eggs is due to several factors, most of which are more or less completely controlled by the manager of the flocks. It is somewhat controlled by the breed, though the difference in size between breeds is not appreciable to the average person. The Minorca is supposed to lay as large, if not the largest egg of any standard breed, and yet the individual variation within the Minorca breed is tremendous. All females can be induced to lay large eggs by the proper care both in breeding and feeding and general management. Some individuals habitually lay very large eggs, while others lay exceptionally small eggs. The latter should be eliminated from the breeding pens and the former increased in number. The under-fed flock will tend to produce small eggs. Plenty of protein is necessary for the manufacture of eggs within the body of the fowl. Foods such as bran, alfalfa, meat scrap and wheat are essential to the laying of big eggs, full of albumen and good sized yolks. A large percentage of corn and starchy foods is usually resultant in small sized eggs. There is a lack of available material from which to produce eggs, themselves great protein products. The season has something to do with the size of eggs. After the spring season of heavy laying there will be a notable tendency to produce small eggs, for many fowls are nearing the end of their clutch of eggs. At such times extra care should be used to put all eggs of the same size together, and selling them for what they are. The average dozen of eggs should weigh from twenty-four to twenty-eight ounces, the latter being much preferred. The public will buy eggs from the producer that brings her good, large eggs. The presence of a little egg in a carton with other large ones looks bad, and creates the impression that such a producer is not absolutely fair and honest.

A factor of controlling importance in the quality of eggs is the cleanliness of the eggs themselves. Dirty, filthy nests are the cause of a great majority of the dirty eggs that spoil the appearance and selling value of eggs put upon the markets. It is not wise to make a practice of washing eggs, for eggs keep better if not washed. But it is a bad practice to sell dirty eggs. The secret of clean eggs lies in the care of the nests as a rule. Every nest should be kept clean and dry. Wood shavings make a good dry nest litter, or chopped straw. Whatever material is used it should be replenished from time to time, and all manure removed, so that when the egg is dropped in the nest it will not become soiled. In extremely wet weather, especially on sticky soils, the hens will soil the eggs by bringing mud into the nests on their feet. There is nothing left to do in such cases, but either shut the birds in the house, which is not always possible or practical, or wash the eggs. Dirty, bloody eggs spoil the sale of many lots of eggs, and as it can be so easly avoided, the loss from this source is directly the fault of the person handling the eggs.

All freak eggs should be sorted out from the cases that go to the market. Uniformity in shape is desired. Only normal shaped eggs should fill the market baskets. In the average flock there are but comparatively few freaks, and these should be used at home.

WHAT CAN BREEDING DO?

Breeding and careful mating of birds that produce the eggs from which the laying stock is to be hatched will have a marked effect upon the quality of eggs produced in that flock. Not enough of the importance of this factor has been realized. In the first place the pure bred fowls are those that will produce the most uniformly colored eggs. Mongrels are of indefinite breeding and can never be relied upon to produce eggs of either uniform color or size and shape. This is one of the most forceful arguments used for the standard bred birds. A pure bred bird has been developed as the result of a demand for a fowl that would breed true generation after generation. Constant selection along such lines has developed our present pure breeds of fowls. Among

other characteristics that have been developed is that of constancy, at least in a measure, in color and size of eggs. There is much variation within pure breeds, due to individualism, but there is infinitely more among mongrel bred birds. Trap-nesting will, in the future, have much to do with the further development of this particular point, I believe.

Egg farmers and producers should keep such breeds as will produce the kind of eggs demanded by the trade to which they are catering. That is the reason why the great egg farms in New Jersey are primarily White Leghorn farms. These farmers are selling to the New York and Philadelphia markets, and the premium is paid for white eggs. The Leghorns are birds that have been bred with the characteristic of the production of white shelled eggs. The birds of the American class, such as the Rhode Island Red and the Barred Plymouth Rock, produce brown eggs and are particularly adapted to regions about brown-egg using centres.

QUALITY IN CARTONS AND BASKETS

Of primary importance is the quality of the eggs themselves, but of great importance also is the nature of the container in which they are marketed. Today there is an increasing tendency toward the use of cartons which hold one dozen eggs each. This is due both to the fact that housewives usually buy eggs in dozen units and also to the fact that such packages are easy to deliver and are of advertising value. On every carton should be printed or stamped a guarantee of the quality of the eggs contained. All cartons should be sealed, in order to insure the quality and make sure that no inferior eggs can be sold under the same guarantee. The printing or stamping should be neat and attractive. The name of the producer and the name under which he sells his eggs should find space on the carton as well. The continuance of this practice will result in the growing of a demand for eggs bearing such name and guarantee. Cartons are a protection to the eggs against breakage and dirt, as well. A great point in favor of their use in the facility of handling. Whatever form of box, carton, or crate is used for market eggs they should be neat, clean, attractive and economical.

Quality in market eggs, then, is nothing more nor less than attention to little details. It includes everything from the proper selection of pure bred birds for the matings in the breeding season to the candling and grading of the eggs after they are gathered from the nests. Now as autumn approaches and winter is near at hand, when egg prices will undoubtedly soar, it is important that every poultry raiser should contemplate as to how to gain the highest market prices for his eggs, and as to how he can better the quality of his eggs.

Highest quality eggs are those which are perfectly and strictly fresh, clean and free from filth and bloody spots, of uniform color, size, shape and weight, large and meaty, packed in neat, attractive cartons or crates, carefully selected.

The above motto should be written in clear type in the egg room on every poultry plant and in the laying house. where its importance can never be lost sight of or forgotten.

THE POSSIBILITIES IN POULTRY BREEDING

The Poultry Industry is With Us to Stay as an Industry—An Organized Industry and the Prospects for Its Development Were Never Brighter Than Now.—Estelle E. Collier.

THE field of labor is full to overflowing along every line. It is one of the things agreed upon by both capitalists and socialists alike. Every line of business you may mention is run on a close margin of profit entailing great loss from waste and overlooked opportunity.

Out in this great Western country where opportunities are supposed to grow or fall from the tree tops we see the loss from waste. These great stretches of timber lands, from which million of dollars are coined each year are often swept away by forest fires that takes as well the homes of hillside farmers. Great stretches of logged off lands represent millions of dollars of waste in the great stumps sometimes left standing as high as six feet, with a circumference of often fifteen and twenty feet. Great may be the demand for lumber, for wheat and for corn and all vegetables, but in every community on the face of the globe stands a never yet satisfied demand for meat in any form. Beef, pork and mutton have always a high price and a demand that keeps those prices high, but never in the history of civilization has there been a time when turkeys, ducks and chickens did no represent a luxury as meat and cost more per pound.

The poultry business in the West is becoming one of the great features. When a new community is settled, when land is being cleared for a crop, before even a tree is lowered, the man who would build his home in the West brings with him a flock of chickens and many a time his groceries are supplied by a trade of eggs. Another thing very noticeable about poultry raising in thi Western country is that you seldom see a flock of mongrels. Go as far into the timber as you may and either the Leghorn type is found on farm after farm (tho we in the West always say "ranch") or one of the larger breeds.

When the poultry shows come on in the fall you often see the coops filled by pure breds raised among the stumps of logged off lands and the owners standing by giving a full week of their time enjoying the diversion of the show room, learning the newest wrinkles of poultrymen and studying in some corner away from the crowd, the latest edition of the American Standard. I have seen women, who had been out in the open burning stumps and clearing brush until their faces were reddened from exposure, taking part in exhibitions and doing active work for the organization after having driven ten or twelve miles to get to the show room. This means but one thing. It means that the poultry business as an organized industry has come among us to stay. It is no child's play. In it is bound up the hard working interests of the people who struggle and strive for a bare livelihood and success to them means more comfort in their homes and less laborious lives. They have something to strive for. These hard working people who exist everywhere in the East, the Middle West, as well as in our West, are becoming one in their interests and are bound by the same ties that would build up a poultry business world wide and organized for the betterment of the industry. Into its building is going the devoted application of years of study and from such a united interest we can hope to see results that will put in the shade all other industries that tear at instead of build up the home.

We shall see the day when people will have all over the United States laws made to protect the poultryman in his industry. We have our "Egg Law" now in the State of Washington, that protects the home grower from the imported product and from the cold storage dumping ground. We out here refuse to have our market the dumping ground for cold storage left-overs that have tried to corner the market and kill our sales. We demand that which comes fresh from the hen and the poultry yard.

There will never be a supply to equal the demand for poultry products as long as beef, mutton and pork exist at such high prices. As long as eggs and poultry have to be shipped into a community your supply is not equal to the demand. As long as everyone in your community does not get all he or she wants of anything, the supply falls short of the demand. Therefore, we in the poultry world may look forward only to the difficulties surrounding the raising of poultry products and not worry over its sale.

That element of chance that exists in producing poultry is at the bottom of many busy men entering the field. Business men enter as a recreation and are surprised at the great results attained with so little effort, but the best figures they can compile on the subject cannot be

depended upon to work out, as success in poultry raising depends on conditions that are not always equal. Taking a chance is what they all do and the winner is he who left no stone unturned to bring success. When once the idea is gained that poultry can be left to develop itself we fall down hard and back we go to the original care and method we once used.

There is no limit to the possibilities of poultry breeding. The market is always open. The seasons are always coming about with regularity, making the loss of last year good in a thousand ways. Many who feel discouraged over their losses in the beginning of their efforts at poultry raising, go back to it next season with redoubled effort and often show the old timer what true success means.

The poultry shows that exist in every part of the country are evidence of the great growth of the industry. Ten years ago the members of our Tacoma poultry organization could be seated on four or five benches ten feet long, while now it takes a large room to hold them when they meet.

The possibilities in poultry breeding are not confined to the fancy alone. What business can you engage in where you can figure on the undiminished value of your stock and a profit from what that stock yields. When you have your birds fit for the show room and have won your blue ribbons you have your birds with added value and an egg yield coming steadily forward, the young chix and broilers. Your stock for the coming year and all ready for the market if need be.

The beauty of it all is that there is no limit. You have a business that is ever on the increase. You can raise for egg production and choose your breed for that purpose. You can raise fowls for meat and get your eggs as a side profit. Then when conditions are best for the success of both, if you have been wise enough to keep your flock pure bred you are ready for the poultry shows, where advertising methods are discussed and sales are made that run up profits fifty per cent.

It makes no difference where you live. If it is in the East, near the big markets, or the Middle West, out on farms or on a small place in town. The main thing is sell what you have produced for the highest price you can get for it. Where you find the greatest demand there you find buyers who do not squabble over price. It pays you to keep your flock pure bred, as then you are always ready to get more than the regular market price for the birds that come out surpassing the general flock.

Successful advertising spells successful poultry sales. The sale of one hen to the man who wants just what you have to advertise will pay for an advertisement that will be the means of selling every saleable bird on your place. The demand for fancy birds is too great for people to turn off on the meat market birds that a little advertising will place before breeders anxious for breeding stock and willing to pay the price.

Men and women in the poultry business will walk miles thru the dust or over muddy roads to get birds to add to their flock. They will give up a day driving into town to get a setting of eggs that seem to fill the requirements. We know that the demand for fancy birds is a very real demand, for we know of few fanciers who raise more good birds than they have sales for. One fancier at Kent, Washington, has large flocks of White Leghorn cockerels and hens and pullets in greater proportion yet when the busy season comes on he finds sale for every bird of good points at splendid prices and his culls bring down the feed bill when they are turned on the market at meat prices. This man keeps up his large poultry runs, hires his help and sends his birds to the poultry show with an attendant, paying all expenses with a good net income, his White Leghorns paying all bills.

When poultry pays the bills, when the industry is such that by application one can make a living it behooves everyone who would complain of the high cost of living to start a flock of thoroughbred birds and let them pay some of the bills. The chance is here for all and the one who is more successful than his fellows is the one for whom novelty does not lose its charm with wear. Application, constant unvarying is the secret of success. The finest flock of pure breds in the world will in one season lose all resemblance to the birds from which they sprang if neglected and allowed to roost in dirty quarters or neglected in feeding.

So many people depend on grass for their greenfood. Eggs do not come from fowls kept without greenfood. One little three foot square of soil will raise enough kale plants to transplant for a large flock of hens all the year round. People in the West depend more on the kale they raise for poultry food than they do on grain. They plant a bunch of kale around the stumps when they clear the land. And by the way they plant also great quantities of strawberry plants for the house and raise chickens before they ever start to burn the stumps. Many flocks of chickens in the State of Washington and Oregon are raised among the burning stumps dusting among the ashes as they cool and eating the charred coals after the fire dies down. The opportunity is here on every side and the man is hard to find out West who has not some experiment on hand for raising poultry of some sort. The interest is universal and into the vortex of the poultry world is being drawn men and women from every class in life.

Berry growers in the fertile valleys are putting small poultry houses and enclosing their berry fields in chicken tight fence that they may make a double profit. These growers of small fruit cultivate their berries systematically and thereby turn up many grubs and worms good for egg production. The hens scratch the soil and help the berries except during the year when the young shoots are coming out when the poultry has to be turned into other runs to keep the hens from eating the shoots. This gives the poultry-berry grower a chance to have poultry runs in process of cultivation growing oats and kale while the hens run in the berry fields.

This merely serves to show that the old time method of raising poultry in closely fenced yards of small dimension, never giving a change of quarters until the yards were infected with disease, was all wrong. Such methods as those were what disgusted so many with the poultry business. Now that the industry has acquired caste and is known to be one of the leading industries of the world we find more people experimenting by combining it with other industries that pay along the same line. It is like the farming of the Japs who raise three or four crops in one row, making one succeed the other, as with meat while they build their homes. We are here already in the field to supply that demand and if then well as grow in unison. In our garden where I have imitated them I have growing now in the same row some very fine head lettuce, parsnips and cabbage, in others some carrot, cabbage and lettuce. So with poultry. The more growing things in the yards the better the flocks.

With the end of the war will come hordes of immigrants to settle our public lands that will be thrown open for settlement and the logged off lands of our Western states will be cleared by foreigners. All these people will make up a new field for poultry products. They will create a demand that will be hard to satisfy. There is our great chance, coming as sure as the end of the war must eventually come. The people will start with poultry as their easiest way of supplying themselves the industry does not overleap its present bounds and make the fancy a permanent and popular thing with this new trade, the fault is ours. We must be ready to advertise when they come in a way they can understand. We must be prepared to supply any demand and to let them get our idea of what good poultry yards should consist. Our Standard should be in great demand and when we have this new custom governed by the American Standard of Perfection the fancy poultry breeder will have hard work to keep enough fowls on hand to supply the demand.

Never before in the history of the world has the prospect been greater. It is a poor wind that doesn't blow somebody some good," and we, if we keep out of this world war, will be able to build up our "Billion Dollar Industry" into something for seers to write about. It will indeed be true that not only the goose but the hen will lay the "Golden Egg."

Now, whereas thousands of dollars each year sent out for eggs and the Chinese flooding of our western markets with eggs at less cost than we can produce them, we have before us the problem of supplying our own market and reaping the harvest that is ours for the asking. What manufacturer would not welcome a locality that supplied him with an assured market? What manufacturer would not move anywhere where he was sure he could sell all he produced. Yet here we are faced with a proposition that asks us only to produce. The market is at our door. In every part of this great country the demand is sure, the market open and the

work of supplying the demand ours. Could a condition be better?

There is no business that demands less and gives more. Incubators are now made that will hatch with more faithfulness than "Old Biddy," and if raising with brooders is obnoxious as it is to some "Old Biddy" can still fulfill her mission in life by brooding the chix. That old bug-a-boo and ever present enemy to the poultry industry, the louse, can be kept under control with lice killers that really do effective work without injury to the fowls! "You cannot have your cake and eat it," and if we would reap the benefits from this industry we must put up with a few of the inconveniences and work a little to get the results. Hens do not raise themselves.

Get the idea that the poultry industry is with us to stay as an industry, an organized industry and the prospects for its development were never brighter than now. It is the one industry where great amount of capital is not necessary for its beginning now for its upkeep. The modest hen gives much and asks little. She will give good results if given an old tub to lay in or a sheltered fence corner if food and water is supplied her, but when systematically fed, sheltered and watered, with shade for the hot days of summer she will develop a plumage and supply a demand on the market either for meat or fancy that will fill the owner with a desire to compete with all exhibitors in the show room and for egg production.

(Continued on Page 412)

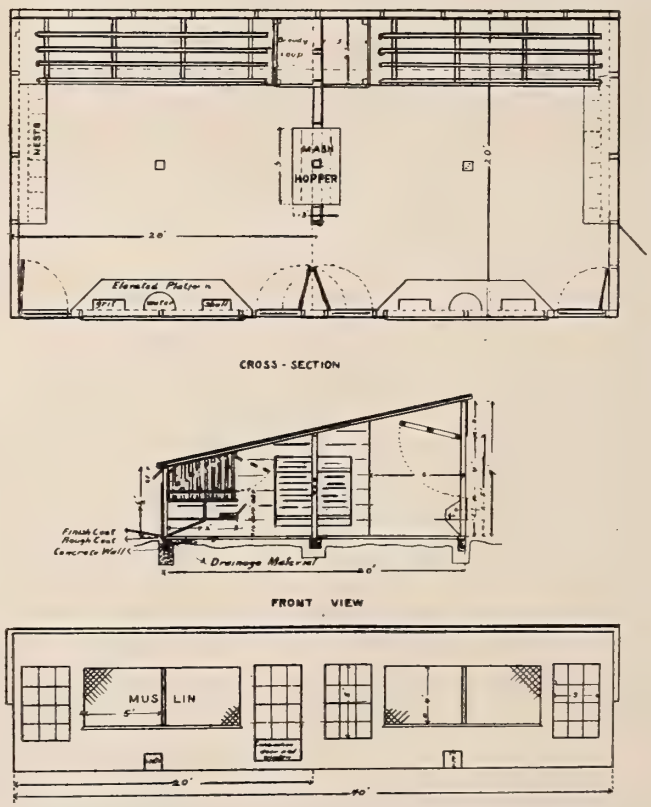
EVERYBODYS POULTRY HOUSE

The Problem of Surrounding the Poultry Flock With An Ideal Environment Is One of the Most Important Which the Poultryman Must Solve.—By H. R. Lewis.

BY ENVIRONMENT is meant the external conditions which surround the flock, such for example, as temperature, moisture, sunlight, and all other similar factors which in large measure are artificial since they are controlled by the poultryman. A suitable environment means a healthy, contented flock. It is the healthy, contented flock which is capable of producing eggs at a profit and of making satisfactory gains in body flesh. Environment then determines in large measure the resulting profit from the flock. The factors of breeding and feeding are other very essential and fundamental considerations, but even if birds are carefully mated and their offsprings well bred, if they are not provided with proper surroundings they cannot develop those inherited characteristics to their fullest degree. To create and insure this proper environment it is nessary to give the laying flock properly planned and well constructed quarters. In other words their house should be so planned and built that economy, efficiency and durability shall be assured.

THE MODERN IDEA IN POULTRY HOUSES

For centuries birds, then in the wild state, lived exclusively in trees, until as man developed in civilization and the wild birds of the jungle became more and more domesticated it became necessary to provide them with suitable shelters against extreme weather conditions. As the process of domestication developed and more and more in the way of production was expected from poultry it became of increasingly greater importance that they should be more securely protected



WORKING PLANS OF A STANDARD MULTIPLE UNIT LAYING HOUSE.—This is one of the most economical and efficient types of houses to build for the laying ock.

The high performing animal, whether it be cow chicken or horse, is essentially artificial, being the product of man's efforts in this direction. This greater performance is in large part due to greater care in feeding and to a careful study of the most suitable environmental conditions. The New Jersey Experimental Station has for four years been making a careful study of environmental conditions which are best adapted to the maintenance of health and production in the poultry flock. And as a result of this study the requirements of light, moisture, ventilation, etc., have been carefully studied and from the study of many types of poultry houses a type has been evolved which, it is believed, embodies the ideal features of the most efficient and economical house for the laying and large breeding flock. It can be safely said that there is probably no such a thing as a one best house for all conditions of climate, altitude, latitude and the very nature of the type of poultry farming practiced will affect the design. It can be said, however, that there are certain principles which govern the building of a poulry shelter for any purpose, it being the problem of the builder to apply these principles in the most economical manner under his particular surroundings. It is with a full discussion of these principles and a suggestion as to how to apply them that this paper will deal.

PRINCIPLES OF POULTRY HOUSE DESIGN

The following factors govern the design and type of the poultry house, for without them the health of the flock and its continued high production cannot be assured.

An abundance of unadulterated sunlight.

Constant and complete ventilation.

Absolute freedom from moisture.

Sufficient room for the size of the flock.

Protection against excessive temperature.

A neat, sanitary construction.

Proof against rats and mice.

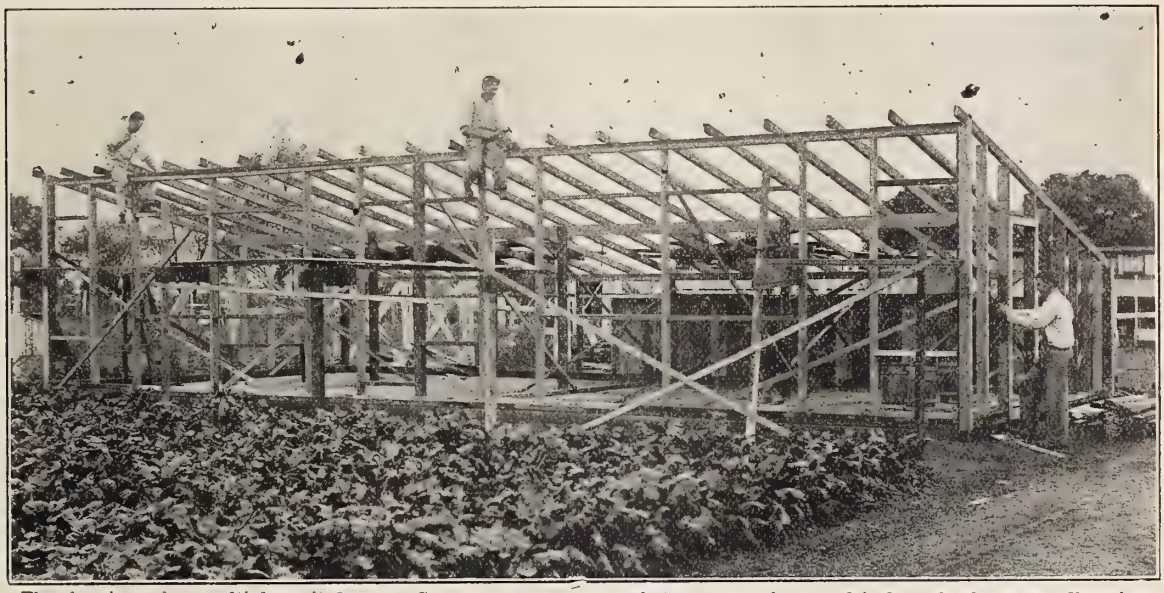
Economy in material and labor.

Convenient in regard to caring for the birds.

All of these factors either as a whole or in groups can be worked out successfully in a great many different types of houses. When, however, the factor of economy be included it becomes a different story. There is found to be one general style of house and one general scheme of construction which admits of all these principles being economically worked out. The following discussion points to the importance of these principles enumerated above:

An Abundance of Unadulterated Sunlight—Sunlight is the greatest germ destroyer known. It reaches all cracks and corners where it strikes, killing all germs of disease

and cleansing the entire surface. It adds warmth on the short cold days of winter. Its presence makes the interior congenial and lends contentment to the flock. Every observant poultryman has observed how the birds struggle for the sunny spots on the floor and lie there during the cold weather dusting and taking invigorating sun baths, combined in many cases with a good dust bath as well. The house should be so placed and the front so planned that during the winter months especially the sunlight will strike every part of the floor at some time during the day The direct rays of light are the most beneficial, reflected rays not performing the desired function. Remember that sunlight acts as a tonic to the flock, inducing a heavier and more profitable production of eggs and insuring a healthier and more contented lot of fowls. This is what we are all after, so why not see that our birds get the light.



The framing of a multiple unit house. Strong and permanent, but no money is wasted in large lumber or needles pieces.

Constant and Complete Ventilation.—Every one of us appreciates the importance of oxygen in maintaining life; how necessary is is in the process of building up waste tissue and in forming new tissue. In these instances it acts as a food, it being carried throughout the body in the blood. Oxygen is supplied to the birds from the air and hence the need of plenty of fresh air in the poultry house. Where a large number of layers are confined to a long laying house, as is so common on commercial egg plants during the winter, special care must be used to keep the supply of fresh air constant. It is very important to maintain this ventilation without any excessive drafts. The fresh air can best be supplied through openings in the front, so placed that the floor is not drafty. If these openings are about two feet above the floor and provided with muslin curtains, which can be let down during the storms and during exceptionally cold weather, all the fresh air which is needed will be present. The opening should extend practically the entire length of the house and be from three to four feet wide. Some of this space should be provided with glass covering in the form of hinged glass sash to let in light on stormy days when it is necessary to have all of the muslins shut. Ventilation in the back of the house for use during the hot summer months is valuable. It is not only desirable to keep the house warm and dry in the winter, but it is just as necessary to keep it dry and cool during the hot summer. No expensive system of ventilators, which sometimes work and sometimes not, are necessary. Muslin curtains and plenty of open front, with back ventilation for summer use, are all that is requisite.

Absolute Freedom From Moisture.—Moisture wherever found leads to the development of disease germs and general unsanitary surroundings. Moisture in a poultry causes the birds to become run down and easily susceptible to roup and its kindred troubles. The designer of a poultry house must guard against three distinct types or sources of moisture. First, there is what is called atmospheric moisture, so called because it exists in the air in the house. It is caused by a large number of birds being confined to a limited area and an insufficient amount of ventilation being provided to carry off the moisture which is given off in their breath. When this type of moisture is present it can be detected by a dampness in the air on entering the house, usually a nasty odor and damp litter. Early in the morning, during a cool night it can be seen in the form of drops of water on the rafters and side walls. The amount in the air has become so heavy that a sudden change in temperature has caused it to become precipitated on the interior of the house. Such conditions are far from healthful. Plenty of ventilation removes this moisture and the carbonic acid gas (a poison)) which is given off with it.

The second type of moisture which must be avoided, is termed soil water. It is the moisture which comes up through the soil and if the floor were of dirt and the moisture abundant, would wet the litter and make the house very unsatisfactory. Such conditions are very common where the location is low and the soil heavy and springy. A good concreter floor with plenty of drainage material as a sub-base will prevent this. Elevating the house about two feet off the floor will answer the same purpose, the former method, however, being preferable. Very moist locations should be avoided.

The third type of moisture which may bother the house is what may be termed surface water. It is only apparent when the house is placed in low spots or hollows. In the spring of the year such places may form small ponds during the melting of the snow or during periods of freshets. In many instances the writer has seen poultry houses located in such places where at times the water has stood over a foot deep over the floor of the house. It is needless to say that such conditions cannot be tolerated in a successful house. The avoiding of such locations and the raising of the house at least six inches above the top of the soil and placing it on a good concrete foundation are preventatives.

Water of any kind in or about the poultry house is contrary to a congenial environment and to sanitary conditions.

Sufficient Room For the Size of the Flock.—Birds should not be crowded. At least four feet of floor space should be provided for each bird in a given house. The size of the flock must be determined by the floor area. Exercise is essential to health and vigor. The floor is the only place where the layers during the winter can get this exercise, hence the necessity for a sufficient amount of room. The crowding of too many birds in a given area necessitates extra labor in keeping the floor and litter clean and in maintaining sanitary conditions. Where heavy birds are kept, such as Brahmas, it may be desirable to allow more than four square feet to each hen. In the breeding pen it is by far the safest practice to allow each breeder at least five square feet and even more may be advantageous.

Protection Against Excessive Temperature.—The birds must be protected during the winter from excessive heat. The average hen will stand a considerable

degree of cold if the house is dry and well ventilated, whereas, if the house is damp and drafty a considerable warmer temperature will result in serious trouble. A good test is to so build the house that at no times will the temperature and moisture conditions be such that the combs of the birds will become frosted. The small, close-feathered, large-combed breeds of Mediterranean origin, require more protection than the better protected American breeds. A well designed house is so arranged that the temperature given off by the birds can in part be conserved to warm the house. The use of muslin curtains at the front of the house, and if need be, a temporary drop curtain directly in front of the perches in very cold climates, will usually be sufficient protection. Healthy birds and a dry house are of even greater importance than temperature.

A Neat, Sanitary Construction.—The internal construction should be as plain as possible. All boards should be planed and set tight, to avoid cracks and holes in which mites may seek a hiding place. All fixtures, such as nests, perches, etc., should be made portable, so that they can be easily detached and taken down for cleaning. The litter should be kept dry and coarse, the windows clean and the walls swept clean. Cleanliness is the next thing to profit in the poultry business.

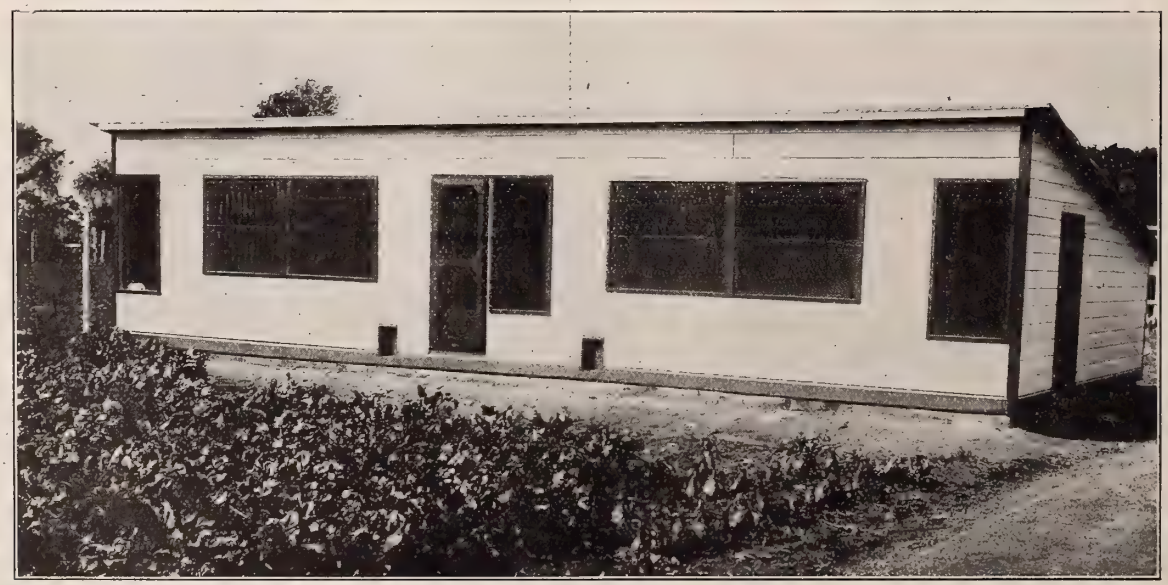
Proof Against Rats and Mice.—Every poultry house should be so built that rats and mice can find no places to burrow in or about it. A good family of rats will not only destroy many young and half grown youngsters, but they will eat up large quantities of food, especially if hoppers are used in the feeding practice. A good concrete foundation and floor will absolutely prevent rats from bothering the birds. The foundation should be built deep and the floor of such a strength that they can neither burrow under nor through. The cost of such a floor can often be saved in one year by the saving from loss due to this one source alone. Such a floor will be remembered was recommended as a prevention against moisture.

Economy in Labor and Material.—Along with efficiency, as measured by the factors discussed above, should go that of economy. Economy means money saved in first cost. It means money saved in interest on investment and money saved in heavy maintenance charges. The house which best provides the above conditions at the minimum of cost we will all agree to be the best. It is not always necessary to buy new lumber for the poultry house. Often old farm buildings may be torn down and much of the material utiized, or, as is often the case, such buildings may be of a style which will admit of their being remodeled at small cost into very efficient houses. When purchasing new lumber a very good grade for sills and frames is desirable, while a cheaper grade can be used for boarding and roof, especially if the latter is to be covered with a good grade of roofing paper. Fancy and elaborate plans, with many trimmings, requiring a costly construction, tend to reduce economy as well as efficiency. The comfort of the birds and the fitness of the house is not enhanced in the least.

Convenient in Regard to Caring for the Birds.—When planning the house every effort should be made to have the construction as convenient as possible. Certain labor saving devices which have been found satisfactory should be installed, such for example as double swing doors between pens, friction stops to all doors, large self-feeding hoppers, large roomy drinking vessels which can easily be filled and cleaned. Portable nests and all fixtures should be raised above the floor, giving all the floor to the birds and making it easier to care for the flock. A convenient arrangement for removing the litter and feeding the flock is an advantage. Houses and pens should be so arranged that a system of chores can be planned which will admit of as few extra steps as possible in the shortest time possible. All of these things should be foreseen and planned for before a stick is sawed. Convenience means the reduction of labor and a big saving in the cost of production.

A STANDARD MULTIPLE UNIT POULTRY HOUSE

As a result of the studies at the New Jersey Station it was appreciated that a standard house which admitted of adoption to a variety of uses and to any size of flock and to a great many locations would have many possibilities. With this in view the following style of house was evolved. It was found that a house approaching a square was the most economical to build as it took less wall material. Furthermore it was decided to adopt a standard size which had a standard capacity and this unit or standard could be indefinitely increased as desired. A unit 20 feet square, that is 20 feet wide and 20 feet deep was used, after much experimental data was secured to prove the value of such a size. This unit has a floor of 400 square feet, or a capacity of 100 birds. A shed roof type of construction was used, with a front wall nine feet in heighth and a rear wall five feet in heighth. When it was desired to house 200 birds a double unit, 20 by 40 feet could be built ,and when 500 birds was the desired capacity, a house 20 feet wide and 100 feet long would naturally follow. This scheme of construction has proven very popular in New Jersey and other Eastern states. One big advantage is the fact that all buildings are uniform and if at a later date it is desired to enlarge the plant it can be done on a uniform and definite plan.



A double section of the multiple unit house completed. and cost complete with labor approximately. $250.00

This house, 20 by 40 feet, has a capacity of 200 laying hens

SPECIFICATIONS OF A DOUBLE UNIT HOUSE

The following is a brief specification of a double unit house with a floor space of 20 by 40 feet. All studding and rafters are 8x4 feet, hemlock or yellow pine. The sills should be 4x6 inch material and they should be bolt-

ed to a six inch concrete foundation wall. A 2x6 inch girder runs the length of the house, supporting the rafters at their center. The girder is in turn supported every ten feet by a 4x4 inch post, resting on the concrete floor. The plates are 2x4 inch material doubled and joints broken. All outside walls and roof are single boarded with tongued and grooved material. The back wall and roof should be covered with a good grade of roofing paper. The opening in front, where the muslin curtains are placed are 4 by 10 feet. The curtains are made in two parts and are hinged at the top, lifting up. The glass openings are 3x5 feet and the glass sash is hinged at the side and opens against the wall on the inside. The dropping boards, nests and perches are all attached to the back wall. They are all portable to facilitate cleaning. The nests are darkened by a hinged door in front and the hens enter from the rear.

A dividing partition is placed between every two units; it is built of boards and extends from the back wall to within six feet of the front wall, the remaining space being left entirely open. This partition is important as it prevents drafts when desired to use the house for two flocks of birds a light wire partition can be used to close the remaining space. A large dry mash hopper is built in the center of this partition, feeding from both sides. All other fixtures and feeding utensils are placed an an elevated slatted platform just under the muslin openings on the front wall.

CONSTRUCTION OF CONCRETE FLOOR

When the house is completed, a concrete floor should be laid and should consist of three distinct layers. First, a layer of eight to ten inches of cinders, or crushed stone, well tamped and leveled on top. Next a rough coat of concrete should be laid about two inches thick. It should consist of one part cement, three parts of sand and five parts of cinders. This should be tamped and leveled and over it should be applied the third or finish coat. This should be about one inch thick and should consist of three parts of sand to one of cement. It should be leveled and trowelled smooth. Such a floor is moisture proof, rat proof, vermin proof and is easily and quickly cleaned, and is more economical than a wooden floor and more sanitary than a dirt floor.

MATERIAL REQUIRED TO BUILD A DOUBLE UNIT

Lumber—

Sills	6 pieces 4x6 by 20 feet
Plates	8pieces 2x4 by 20 feet
Posts	2 pieces 4x4 by 14 feet
	2 pieces 4x4 by 18 feet
Studding	9 pieces 2x4 by 18 feet
	4 pieces 2x4 by 14 feet
Rafters	22 pieces 2x4 by 22 feet
Frames for nests and dropping boards	5 pieces 2x3 by 16 feet
Boards for roof, walls and fixtures (8 inch T and G)	2,200 sq. ft.
Curtain frames and trim, 1-in. by 2-in. white pine	200 linear fete
Nests, 1x4 white pine	10 linear feet
Broody coop	1 bundle plaster lath
Nails, 10 lbs 20 penny wire; 50 lbs. 10 penny wire; 20 lbs. 8 penny wire.	
Approximate cost of the above material,	$ 75.54

Miscellaneous Materials—

Roofing paper, 1,060 sq. ft., 11 rolls	33.00
Four special sash, 3x5 feet	8.00
Muslin, 8 square yards	1.00
Hardware: hinges, locks, tacks, hooks, etc,	4.75
Cement, cinders and sand	55.00
Total cost of the above material	$176.29

Allowing four square feet per bird as the capacity, this makes a cost per bird of 88 cents, if labor were added to the above it would probably bring the total cost of the finished house to about $1.15. This cost, when we consider the quality and appearance of the house and its efficiency as tested by experimental existence and the favor with which it has been received by the commercial poultryman is certainly very reasonable and warrants the statement that this is an economical type of poultry house and suitable for everybody, whether commercial poultryman or farmer.

THE RED AND SPECKLED SUSSEX

A Few Rambling Remarks As To Their Origin, Type, Color, Their Quality and Prospects For Their Future.—By H. H. Coburn

BEGINNING this article, I will state it is the purpose of the writer not to dwell at length on the unsurpassed and unsurpassable utility points of the Red and Speckled Sussex—It now being a well established fact that they are unexcelled layers of nice large, tinted and strongly fertilized eggs (meaning vigor) beating most large breeds in these features, (The Red Sussex being in the lead in size of egg) and producers of the finest flavored meat of any breed in the world. This is a broad statement, but a true one. Before tasting Sussex we thought nothing could beat a Wyandotte and we were never known to refuse a Plymouth Rock, Orpington or any other good chicken, but those who have had the pleasure of eating Sussex will agree with me that as a delicious table fowl Sussex will stand unchallenged.

We aim to make type, color, markings, origin, etc., the gist of this article. In reverse to the others named, we will first mention origin, generalizing, Dorking and Game figure largely in the ancestry of all Sussex. While Sussex were practically unheard of in America, prior to January, 1914, (when we began to set forth their merits in printer's ink) some varieties have been bred in England for centuries—and for utility alone, for years farmers crossing Sussex cockerels on common flocks to command a higher price for their table poultry—as Sussex lead on the London markets and are served on the table of the royalty.

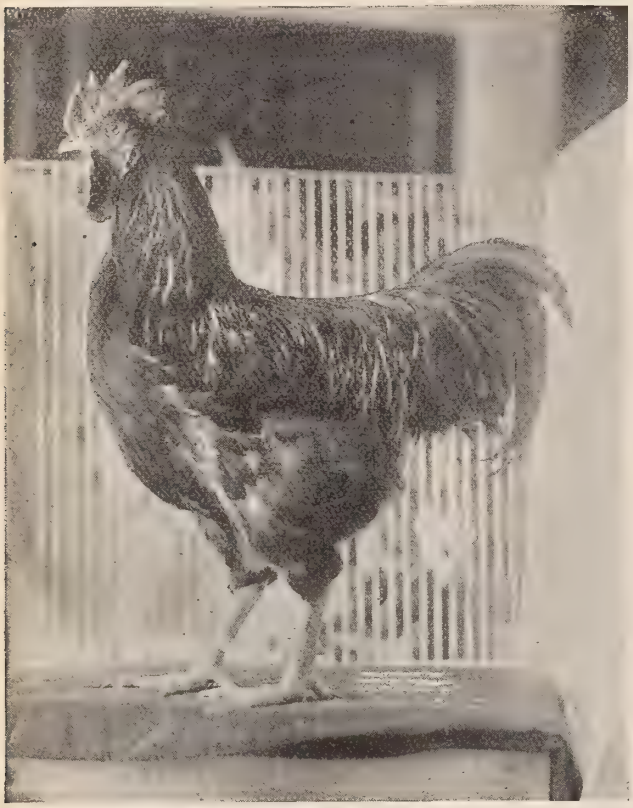
RED SUSSEX

Red Sussex, the most popular variety in America are mostly a blending of systematic crossing of Red Dorking and old English Black Breasted Red Game—the game blood making them rather closely feathered and supposingly heavy and solid. This liberal mixture of both Game and Dorking is largely accountable for their fine table quality.

Some years since black feathers used to appear in body and breast breeding back to B. B. Game—and some strains still have to contend with this trouble, but our strain is practically free from black in breast and fluff of males and were from 75 to 90 per cent good sound colored ones. The English used to breed striped hackles and tickerl saddles, but our American Standard calls for red hackles, but a slight ticking does not disqualify. American bred birds will also have many clear backed females. The old striped hackles gave good shape, wing markings and green black tails. The slate under color gives richer surface color, which stays red. Red Sussex cock birds are richer in color than when they run cockerels, and you will notice our Red Sussex hen won championship over a pullet at the Garden and our Red Sussex cock won championship over our first cockerel. You may think you have a Red Sussex of inferior quality, but you wait until he is a cock bird, he will surprise you. A very good cockerel makes a magnificent cock bird.

We get innumerable letters from all parts of the United States asking wherein Red Sussex differs from and compare with Single Comb Rhode Island Reds, so will simply state they are a darker richer red and have slate under color and white skin and shanks. The Standard weight of all varieties of Sussex are about the same as our Plymouth Rock weights, but some specimens have excelled these weights to the extent of becoming monstrosities in size. The Single Comb Rhode Island Red gives the person who has never seen the Red Sussex some conception of what they look like, but when it comes to speckled Sussex the imagination ceases to work as there

is practically nothing to compare to in color and markings. The ground color of a Speckled Sussex is rich red or bay—a perfect feather on body and fluff of both sexes is red or bay, with a narrow band or half moon of black near the end, the feather ending in a small white



RED SUSSEX

First Prize Pen Red Sussex Cock at the Club Show Madison Square Garden, New York, February, 1915. A beautiful specimen of this valued breed, sound and strong in color, even in all sections and of ideal form. His magnificent rich red color with positive evenness and soundness was marvelous to note His pen mates were equally good and of the same high quality and worth. This kind of stock assures a brilliant success for the Red Sussex in America. Owned and exhibited by the Red Sussex Farms, River Road, Marysville, St. Clair County, Mich.

tip—not spangle. The hackle and saddle of male and hackle of female should be rich red or bay with a black lacing near ends and tipped with white. We get many inquiries regarding our 'Red Sussex" or our "Speckled Red Sussex"—the latter not being so far off as it at first seems. These persons getting their idea that red and speckled describe one variety—from the fantastic gymnasts some printers indulge in, in setting up type for our ads. The Speckled Sussex originated principally from the Red Dorking and Spangled Old English Game cross—and as the oldest variety. Some think they were bred from Jubilee Orpingtons, but it is the reverse—and Orpington type Speckled Sussex have won in Orpington classes in England. (They have more tendency to Orpington type than the Red Sussex.) Some strains show no black at all. Such birds are usually light bay or orange tints with large white splashes, and again most birds shown up to date, have altogether too much black, their breasts, shoulders, fluffs and hackles being almost entirely black and white. This is bad enough, but we regret to say that birds were shown last year whose hackles run solid black, solid white and mixed feathers. Speckled Sussex bred up to our American Standard are worth a lot of money and are equalled or surpassed in beauty only, by the Red Sussex. This being a matter of personal taste. The English Standard calls for almost white tails and wings, while our American Standard calls for almost solid black tails and bay and black in flights. The glossy green black tails add much to the richness and is the climax capping feathers in the attractiveness of the male. There are only two or three of these jewels in America, hatched prior to 1915. The coming shows will show advancement in this direction for the best American breeders will have had experience in breeding them as they have wanted them from the first. One can readily see the unadvisability and the sheer foolishness of importing Sussex bred by the English Standard, when those bred in America are bred by our American Standard, and will win over imported birds. Why not patronize your own counry, for you will have depend on Americans for your trade when you get started.

Then again acclimated birds have more vigor and produce stronger chicks. Importing is especially bad on males and more die in every breed than become acclimated. There are now enough good Sussex in America to make it unnecessary and the American Journals will protect your interests and you stand a chance for redress in case of dissatisfaction. We are now in the position of the boy with the new sled—independent—in Sussex as well as Orpingtons, Campines, Houdans, Games, Leghorns, etc. It is the **Made in America birds that win the Blue** in the show room at **all the best shows all the time.**

Last year some imported Sussex won, simply because they were shown in little or no competition and that few judges knew what a really good Sussex was like and purchasers accepted any old thing that was imported, swallowing hook, line and sucker, because many of them did not know. This year we have our American Standard and the judges will get posted—so those wing birds and birds of like quality will not get a look in, if shown in competition under competent and authoritative judges.

To return to the text—the type of the Sussex is between a Plymouth Rock and Orpington in length of shanks. The breast bone is longest and deepest of any breed, giving room for the most breast meat of any. The back is long, the tail carried at a nice angle. Last year high tailed Langshans, backed and legged birds were shown and won, that are only a disgrace to the breed. Of all things steer clear of this type and abominate high tails. At Madison Square Garden, when our Sussex Club held its meeting, judges were instructed to judge Sussex for **type** and **surface color—visible things**—so Sussex are not handicapped by that big bear, under-color. Sussex are absolutely free from stubbs and it is a pleasure to get a show string ready. The shoulders are very broad

SPECKLED SUSSEX

First Prize Pn Speckled Sussex Cock at the Chicago Coliseum Show, Chicago, Ill., December, 1914. Note his shape, with full breast, grand body, etc. It is impossible to show color or markings to advantage in any illustration He is a beautiful rich red cock with the best laced and tipped hackle we have seen. The Sussex have much to commend them, and are bound to become popular. Owned and exhibited by the Red Sussex Farms, River Road, St. Clair, Co., Michigan. (Note—Judge H. H. Coburn is part owner and manager of these farms).—H. P S.

—the Red and Speckled varieties were the only ones admitted to our Standards of Perfection at the Chicago convention, beating older breeds in America to it, showing how quick we grasp a new thing **that can make good** and that **has to make good.**

The Light Sussex differs from our Columbian Plymouth Rocks in color of shanks and skin only, so failed to get into the Standard. The Brown Sussex male resembles our Brown Leghorns in markings and the females are so unattractive in this variety they will never become popular and double mating would have to be resorted to, to get anything like good ones. The Red, Speckled and Light Sussex are produced by single or standard matings—but this article is supposed to be about Red and Speckled Sussex—the varieties that are making history in hendom and that have come into popularity the quickest and fastest of any breed—they will be stayers—not a fad, for they possess both beauty and utility.

In looking over the club list of members many new names of prominent breeders of other breeds appear—recognizing the great future for Sussex—Sussex is the breed for the city man who wants a few birds for pleasure and recreation and who wants abundance of fresh eggs and the finest of table poultry and for the man with limited quarters and who wants to keep a few pens for settings and has a nice little fancy business—and for the town or country woman who wants a little private income and outdoor life. One or both varieties is a money saver and good investment for the beginner if he or she will take up Sussex and not try every known breed—it will save dollars as the cutting and trying expense costs every amateur. He can be among the quickest and biggest in Sussex of any breeds. The professionals mentioned first, taking up Sussex is the proof of the pudding. Join the procession and our club now.

Editor's Note.—Mr. Coburn was largely instrumental in getting Sussex into the Standard, and is president of the Sussex Club. He also helped make the Sussex Standard. He is part owner and manager of the Red Sussex Farms, River Road, Marysville, St. Clair Co., Mich.—H. P. S.

MR. E. B. THOMPSON'S "RINGLET" BARRED ROCKS

The Strain That Has Made History for the Breed—Their Breeding and Mating—Re-producing Qualities a Line Feature—Their Years of Madison Square Garden, New York, Winning Record—Their Real Worth Backed by 35 Years of Breeding For a Purpose, For Practical Qualities Combined With Highest Standard Quality---By H. P. Schwab.

OUTSTANDING sharp and clear in Barred Plymouth Rock records and history, are the deservedly famous "Ringlets," as bred by Mr. E. B. Thompson, Amenia, N. Y. For upwards of 35 years they now have held the center of the stage, and as time passes have forged to the front, stronger and better than ever, making records that will stand unapproached for time to come. They have virtually swept competition from the field of activities, a condition that is not to the credit of several of our breeders.

The sweeping records made by the "Ringlet" Barred Rocks at the last three or four Madison Square Garden, New York, Shows, were as deserving as they were popular, their inherit quality of color and barring combined with the most beautiful shape is their undeniable feature and quality that the world credits them with, that has won for them and has made their record and position possible. At the two last Madison Square Garden, New York, Shows, Mr. Thompson's Cockerels won every prize offered, viz: First, Second, Third, Fourth and Fifth. Two years in succession this most wonderful record he made. During the same time he also won First Prize Cock each year, First Pen and several other prizes including all specials. The last New York Show he won all Five First Prizes, and everybody that had a right to be was satisfied. In the above we refer only to the last two exhibits. We could well fill pages with his records of the past, but ancient history does not require repeating in his case. His winnings are right down to this day made by him, himself, and with birds he bred.

A visit to the "Ringlet" home is the best illustration we can give of the possibilities in poultry breeding, there personal achievement is evident, the home is a home in all the word implies, while the plant stretches out as far as the eye can reach, with a dozen or more great long buildings and a hundred or more colony houses. The winding private driveways, the grassy shaded yards, the feed and water stations, with perfect arrangement evident everywhere. All point with credit to the master, all has been accomplished by and is the result of successful breeding. Mr. E. B. Thompson owes his success to himself alone. It is the result of his life's labors; the result of his insistent endeavors and his determination to succeed.

Like on former visits here, we are mostly interested in Mr. Thompson's matings and the results obtained. Results are the value tests of line worth and of knowledge in mating. They have their peculiar interests and their particular value, the producing of actual results, i. e., the reproduction of quality with improvement evident is an art in any breed; in Barred Rocks it is a science, a tuition gained by years of study and experience.

Here we have seen and again handled the famous New York Champions of this and last year and here also, we again had the extreme opportunity to handle the Grand Old Champion Male of the New York 1911-12 Show, who in his fourth year has the vitality of a cockerel and whose line and blood values has produced two New York Champion Males and other noted breeders and winners the country over. Today Mr. Thompson has in his yards three (3) Madison Square Garden New York Champion Males and seven (7) First Prize Winning Males at this, America's leading show.

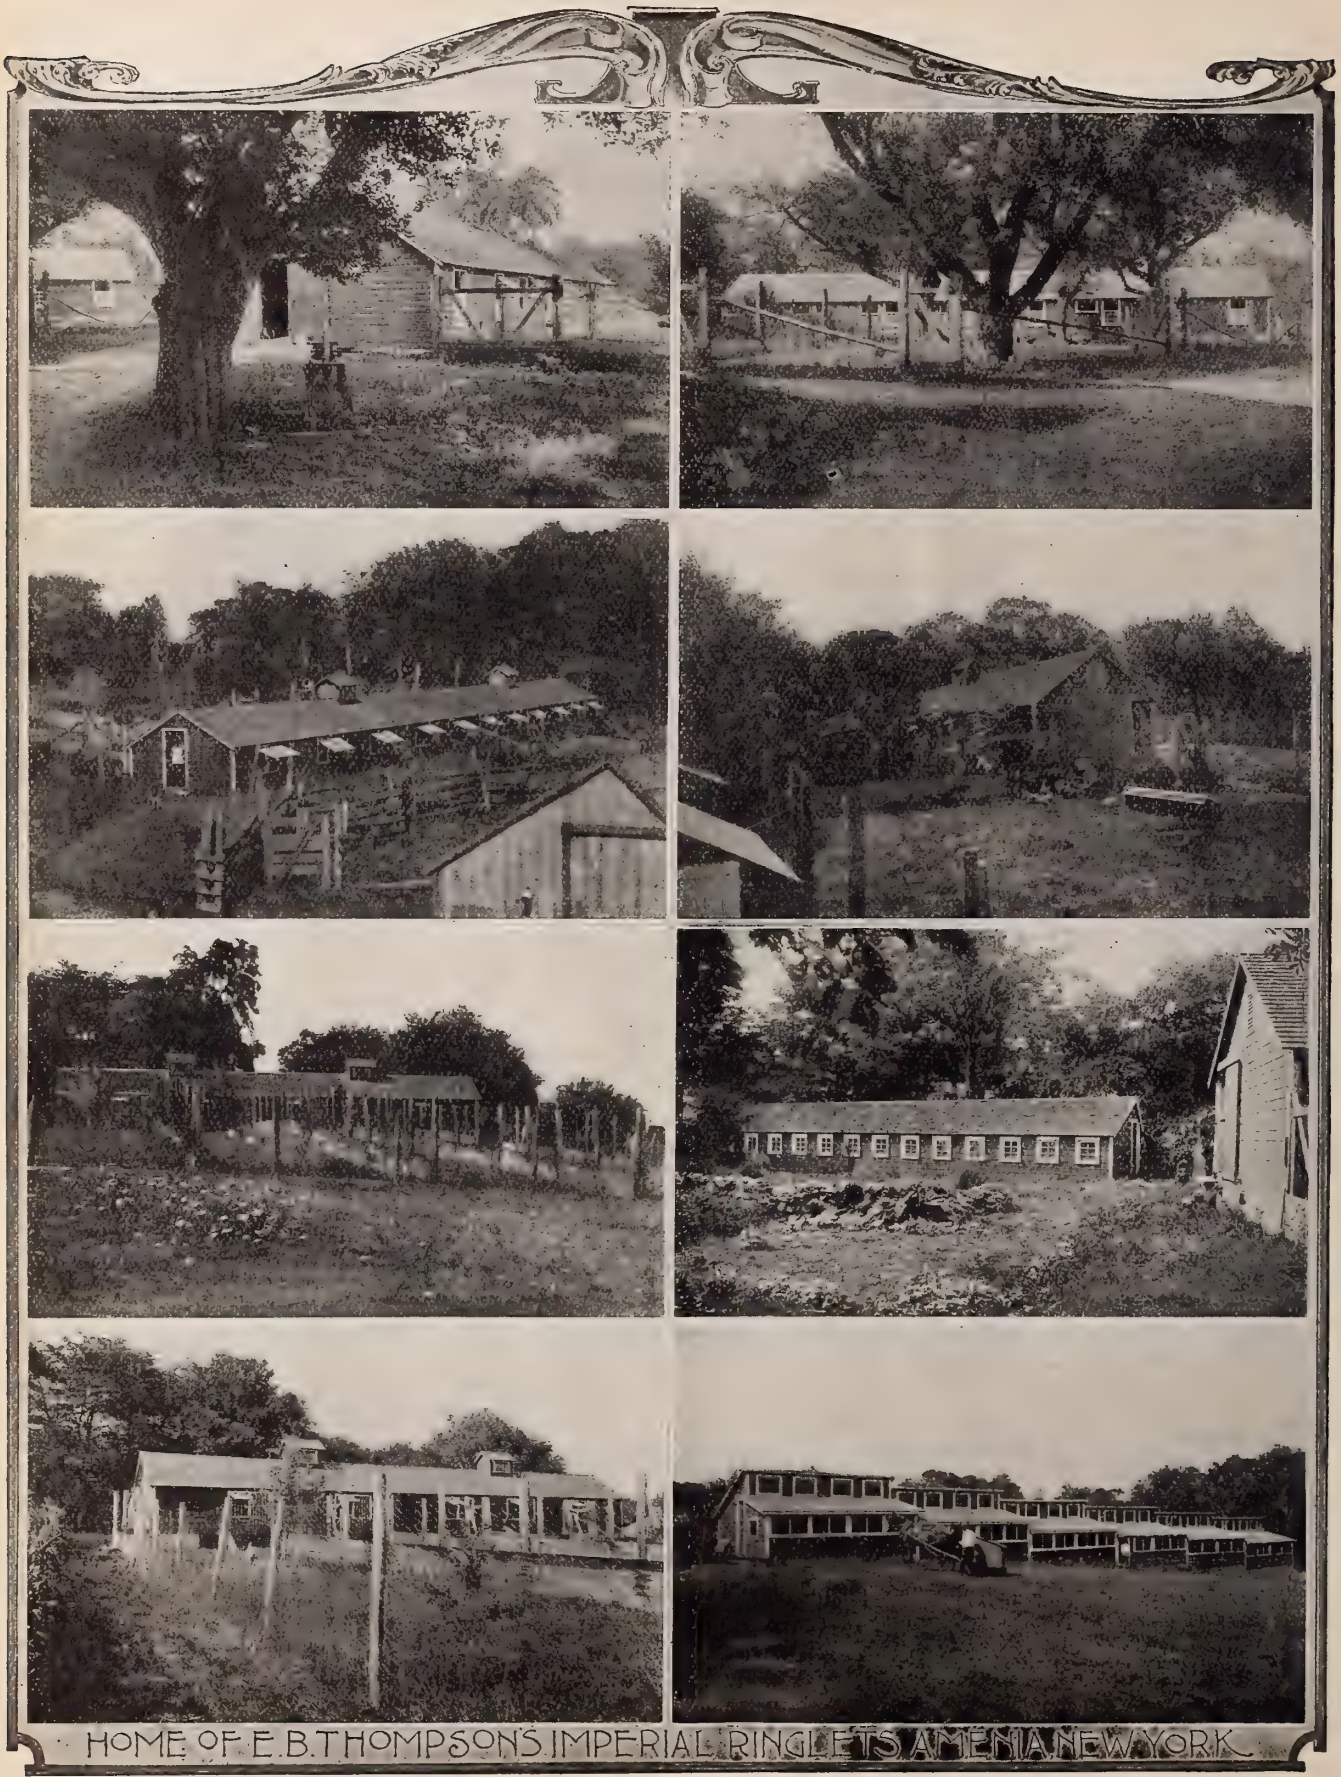
The outstanding feature in this line of males is found in their similarity. The Old Champion of 1911 is the exact counterpart in shape, head, style and barring of the late Champion of 1915. They look alike and they are alike in all characteristics. Color has been improved; the later day birds have more snap, more contrast, while for a generation this line has been bred to a form and style that has been so close to perfection that improvement hasn't been so noticeable.

Aside from the winning males mentioned there were other winners of close to equal value and a great host of unshown birds that would grace any pen or show. To those who attended the last Garden show and saw the "Color-Special" Cockerel we can say he is better and grander than ever; to those who have not seen him, we can say that they have missed seeing the "Best" Barred Plymouth Rock Male ever produced. There has never been a male shown, at any show, that has come within a mile of his quality or of his worth, for he in fact is the ideal and the superior of all. We have seen the best of the birds shown East and West for 20 or more years, and we never expected to see one of his quality. We did not think it possible to combine such shape, color and barring, surface and under in any one specimen.

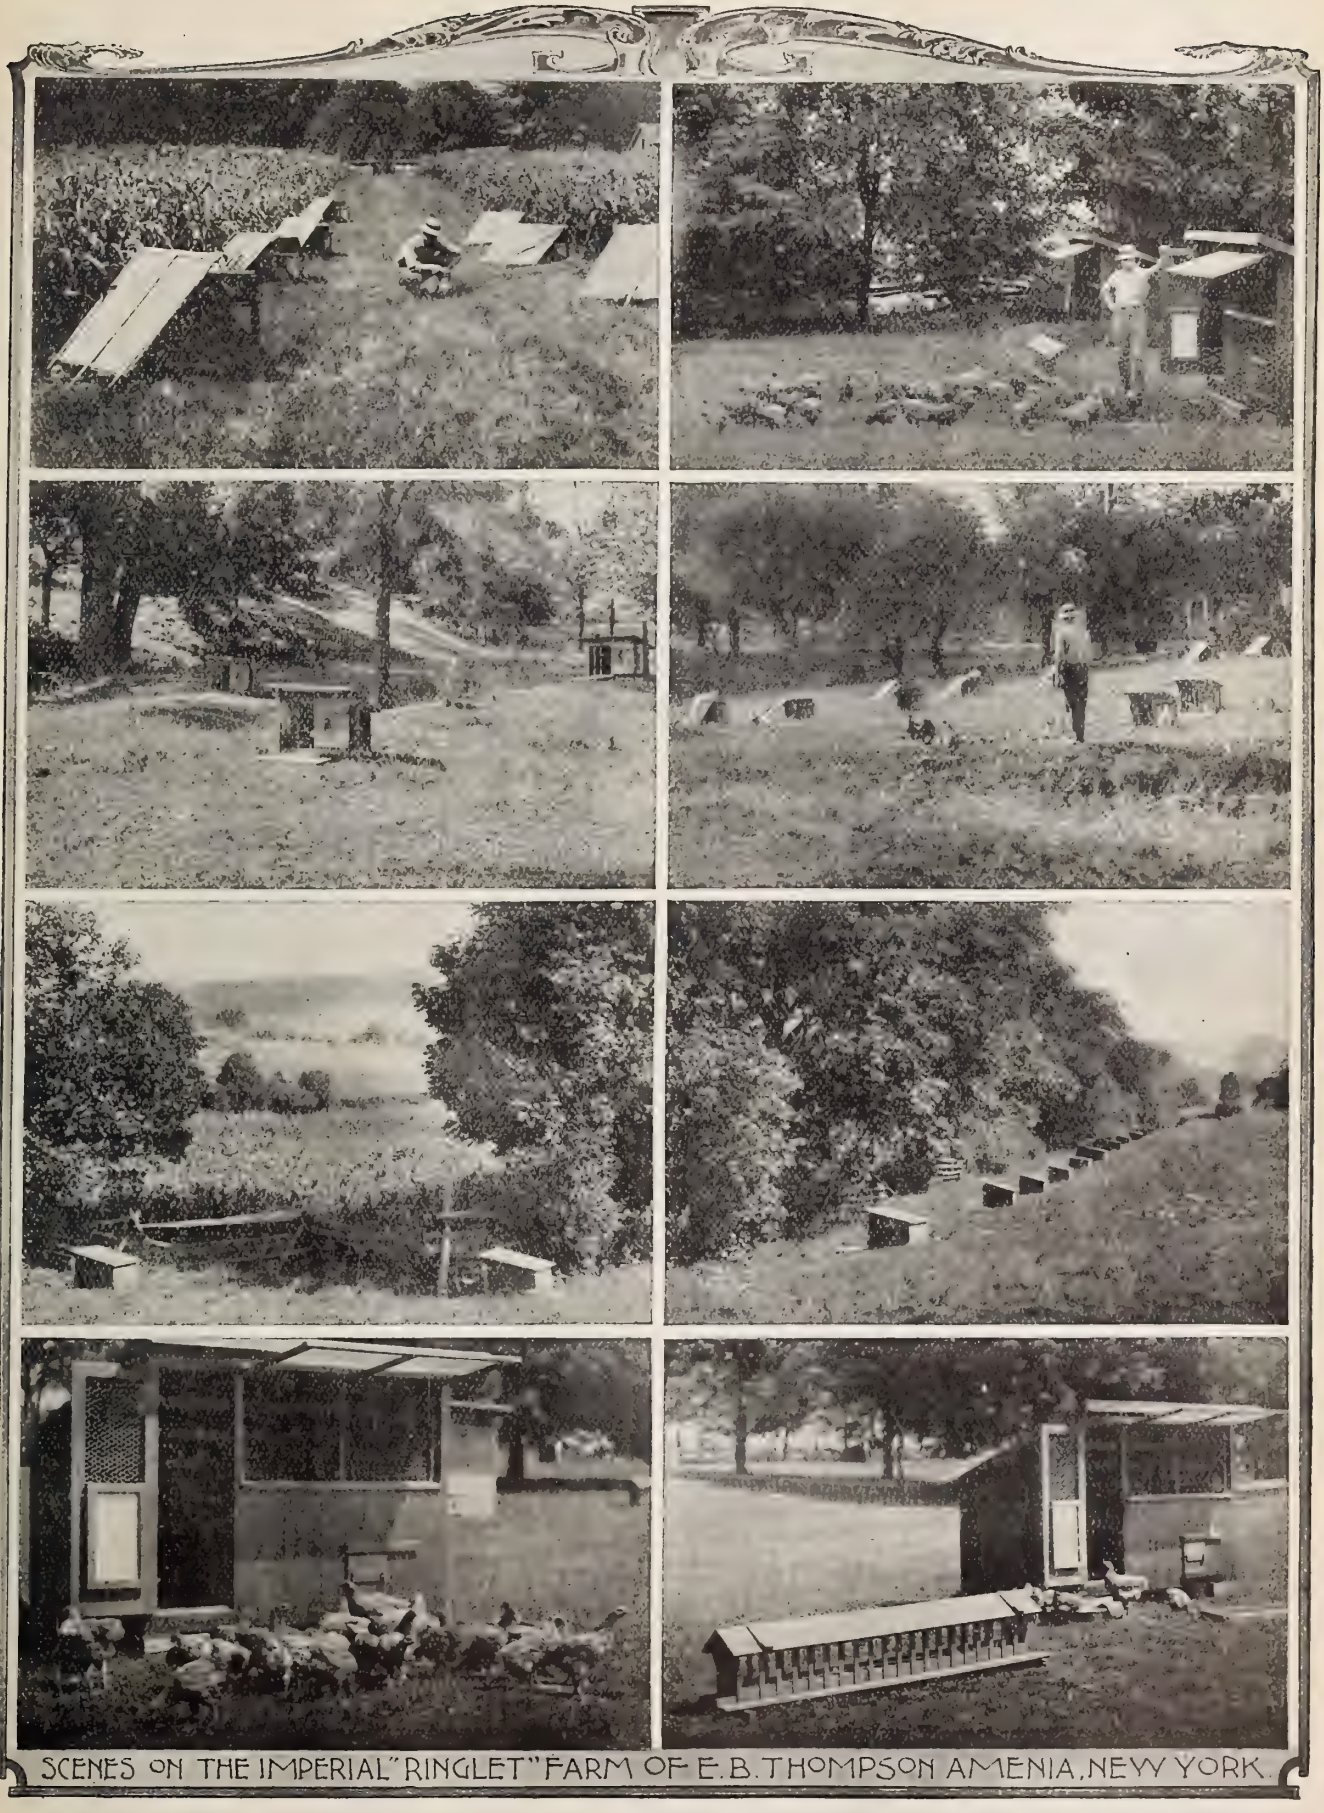
The line of "Ringlet" males has the added quality of breeding worth to an extent where its reproduction has become a line feature, from first to last, the hundreds of males seen here resemble one another, not only in form, size and style, but in color and barring, in evenness and in head points. They well show their quality, breeding along with inherit quality for particular reproduction. It must be evident that this line is one safe to follow and one that insures results in breeding.

THE RINGLET FEMALES

From Mr. Thompson's first New York exhibit 26 years ago to this day, his "Ringlet" females have been consistent winners. We all remember his famous "Helen-of-Troy," who won either three or four First Prizes at New York, who improved with age and who in her fourth year was superior in quelity to that ever shown by her



HOME OF E.B.THOMPSONS IMPERIAL RINGLETS AMENIA NEW YORK



SCENES ON THE IMPERIAL "RINGLET" FARM OF E. B. THOMPSON AMENIA, NEW YORK.

Some few years ago Mr. Thompson established a New York record by winning all five prizes offered on Pullets, a record that still stands unapproached. He has twice equalled this with his Cockerels since, but no other breeder has approached it. At the last New York Show Mr. Thompson won First Hen and First Pullet, and for two years won both Champion Male and Champion Female.

We could well fill many pages with the accomplishments of this line, for the glorious past lives well in the memory and the "Ringlet" records fill many pages of poultry history. The future is full of intense interest, and as we look forward it is with full confidence that we trust it and enter it. At the "Ringlet" home we saw from 2,000 to 3,000 old birds and from 5,000 to 6,000 youngsters, from a week old up to seven months, and pullets who at this time (July 23rd) are fit and ready for any competition.

In the young was seen the quality and the same prospects. It could not well be otherwise; if it were, it would be contrary to nature, and nature is bound to assert itself. In these thousands of young was seen quality at its best, characteristics that follow line and bred into quality desired and bred for in shape and color, and if promises count in chicken breeding, then Mr. Thompson will again show the poultry world more improvement along with a larger line than ever before. In both males and females progress was evident. The quality that breeding has stamped on this line is there, better than ever.

It is a great deal to ask continual improvement year after year in a line that has proven itself a leader, but as poultrymen are expected to ask much, and more as time passes, they are apt to have their desires met, and in a way that will be pleasant surprise for all. While Mr. Thompson's "Ringlets" again assure improvement, other breeders have also been busy and in all the flocks we have seen this year, of all varieties, improvements seem assured. In Barred Rocks there is more to work for in surface and under than in most breeds and varieties, while the good points and sections must be retained in equal value, others are to be improved so the breeder in mating has much to consider and much to try for. The man who can successfully, year after year, produce good general quality and show improvement is a genius, one whom we should appreciate at his worth.

The real influence of Mr. Thompson's work with Barred Plymouth Rocks cannot be overestimated. To him a very great share of their popularity is due and his success as a breeder has cast its influence over the entire industry. He has bred consistently, year by year, showing improvement by producing quality as good or better than the best. He has followed his own ideas in breeding and has produced a line whose greatest worth lies in the capacity to reproduce. His skill and abilty, along with his persistency, combined with the confidence the breeders of the world have in him, brought him the success which is so well deserved. That the men and women of the industry appreciate Mr. Thompson was amply shown by his election two years in succession as president of the American Poultry Association.

BROWN LEGHORNS

This Variety, At One Time Even More Popular Than the White Leghorns, Are Now Small Classes of Medium Quality—By T. F. McGrew.

NO OTHER variety of the Leghorn family has been more admired or sought after as a fanciers fowl than the Brown Leghorn. We can close our eyes and look back on the controversy waged years ago for and against certain features relative to the Brown Leghorn.

As to the origin of the Brown Leghorn, Mr. Feltch wrote in 1873, that the first importation of Brown Leghorns was made in this country in 1855. The pure brown color of the breast was peculiar—distinctive—and beautiful.

The females of that time were reddish brown—in some cases, almost pure brown color; not large and rather short on leg. In color and marking both the males and females were much like the Derby Game of that time. The males averaged from four to four and a-half pounds in weight when a year old.

Some writers have claimed that Leghorns were brought into New England as early as 1835, the color of which is mentioned as having been the same as the Black Red Game. We imagine, however, that there were no specimens worthy of the name brought to America prior to about 1850.

Mr. A. H. Halsted, of Rye, New York, knew more about the early history of the Brown Leghorn perhaps, than any other fancier. He told the writer that he purchased some Leghorns from the captain of a ship coming from Italy, and that these resembled the yellow shanked Black Red Game. Mr. Halsted bred them for many years and was the first to produce good ones in this country. During the time he was breeding the Brown Leghorn, crosses were made by others, who used the Old English Game type of Black Red fowl to cross with the Brown Leghorns to improve the color. These Games had willow shanks and feet and it was thought that the influence of that cross is still seen in the dark color of shanks that is not unusual to the shank and feet of the Brown Leghorn females.

Another feature that indicates the Game cross is the frequency of the creamy tint in the shells of eggs from the Brown Leghorns. Big, badly shaped combs were prevalent; the combs of some of the females had the double loop that is usual with the Minorca and the heel of the comb of the male followed the shape of the neck. The Brown Leghorn as bred in 1880 did not have the same tendency to Squirrel tail that was so marked in the White variety. The illustrations in Lewis White's book of Poultry Illustrations, 1873, shows the Brown Leghorns in color. The fowls illustrated were sent over by Mr. Halsted and they were painted for illustration by —— Ludlow.

Mr. Halsted wrote of them in 1872. The first Leghorns, of which record can be obtained came to Boston Harbor in 1853. Their combs and wattles were large and coarse, their ear lobes mostly red; some had more white than red in ear lobes, but the greater part had ear lobes red like the face and wattles. They were neither Brown-Red Games, or Black-Red Leghorns. They were Brown-Red. The breast of the male was dark brown spotted with lighter brown—the dark brown running up the under side of the neck. The neck hackle was light brown, striped lightly with black. The females were in color about as we now have them, bred from promiscuous flocks. This is as they were in 1853-1855.

The pair of Leghorns that Mr. Halsted sent to England in 1873 were described by Mr. Lewis Wright as being of Spanish type and comb, with the color of plumage like the Black-Red Game, though rather darker in shade; the cock having black breast, orange colored hackle, striped with black; the hen salmon-breasted, with the rest of the plumage partridge-marked, or brown finely penciled over with dark markings.

The Brown Leghorns sent to England by Mr. Halsted had undergone quite a change from their original color of brown-red to the black breast and color marking of the Black-Red Game. This change had been brought about by crossing the Derby Game with the Leghorns, which Mr. Halsted said spoiled them, to his notion, because it had transformed them from Brown-Red to a Black-Red fowl. The tracing of this change in color type from 1853 to 1875 marks the first twenty years of breeding by the poultrymen of America.

Before going farther into their existence in America we shall quote from recent write-ups of them by English fanciers. Mr. Morton writes that the Brown Leghorn has not been allowed to deteriorate as in some of the other varieties. On the question of type he says no other Leghorn has kept so near to "Standard" as the Browns. Mr. Verrey, of England, claims that the Brown-Red Game cross is responsible for the dusky feet and spots on the shanks of the Brown Leghorn pullets; but

in spite of this, he states that the Brown Leghorn is the most typical of all Leghorns.

The English Standard describes a different shade of color to that mentioned in the American Standard. The English prefer lobes of medium size, almond shape, fine in texture and like white kid; a cream or yellowish color in lobe is a serious defect—we admit—white or creamy white as correct for the ear lobes of Brown Leghorns. The hackle of the male by the English Standard must be rich orange-red, striped with black, but not densely striped. The American Standard calls for a rich brilliant red in neck hackle of male, this heavily striped with black running parallel with the edge of the feathers and the striping to have a bright sheen upon it. The body color of the English female must be a rich but soft brown, very closely and evenly penciled (stippled), with black, breast rich salmon, body plumage light brown evenly stippled with darker brown.

THE BROWN LEGHORN MALE

The finest type of Brown Leghorn male is truly an artificial product of wonderful beauty; and while our English cousins do not like it, there is no getting around the fact that it is beautiful. Whether or not it is of value as a commercial or utility product has no place in the fancier's heart. To produce fowls of such quality is an art that but few fanciers have acquired and their number grows less. "Color Type," a new term brought into use by the tall sapling of the Maumee District, Mr. F. C. Platt, is not bad. He writes: "When such a feather is marked according to the Standard pattern, and each part of the feather design is of the Standard shade of color, a complete harmony of color is seen through the specimen." In referring to this completeness of design and color a new way is now coming into vogue and that is in the use of the term above mentioned—"Color Type."

We bring the above expression to your notice so that you may have impressed upon your mind the several thoughts of what was the original Brown Leghorn of sixty years ago, the plan followed prior to nineteen hundred and the different ideas of fanciers throughout the world.

The Color Type of the exhibition Brown Leghorn male is quite as difficult to produce as it is in the Partridge Cochin male. To produce either or both of the richest shades of color, all to blend one with the other, without bad markings or black collars about the neck, is most difficult. The black striping in neck hackle, back and saddle must not extend to the point of the feather; all of them must be completely surrounded or edged with rich, brilliant red. The greenish-black stripe in each feather must be so prominent as to have the appearance of having been laid on top of the red. To have all of these requirements in one specimen is the work of an artist.

The beginning of the change of color in the Brown Leghorn male came when Mr. W. Theo. Wittman mated a Black Leghorn hen to a Brown Leghorn male, the male that he used had fairly good striping. He wrote of this, that the result surpassed all expectations—from but little or no striping in the fowls mated he got striping in abundance in the offspring. The young males from this mating had a rich green sheen in tail feathers and the striping in hackle, back and saddle plumage was wonderful. From this strain by selection and by mating for color and marking was made a line of males that astonished the fanciers of this variety and from their existence came a demand for a standard to describe them. Following this came the necessity for double mating—one to produce Brown Leghorn males for exhibition and the other—to produce Brown Leghorn females for exhibition.

THE BROWN LEGHORN FEMALE

The Color Type for Brown Leghorn females was made by Mr. Geo. H. Morris, of East Orange, New Jersey, who produced some of the most beautiful plumage color ever shown in this variety. He brought females to the Madison Square Garden show that possessed every point desirable—save yellow shanks and feet. These were too dark in color to meet Standard demand, however. There was some little undercurrent of dissatisfaction at his winning. yet nevertheless, the female line bred and shown by him has been the one line from which all of the best Brown Leghorn females have come during the past fifteen years.

Mr. Morris was an ardent fancier. His strain of Brown Leghorn females came from a union of the Howell and Burgott strains. Mr. Morris was the first to establish a mating or a line for producing females alone for exhibition. He selected each year from all he hatched, two or three males. This selection was made when the chicks were about six weeks old. The young cockerels that had body plumage color quite like the little pullets were the ones selected and banded for future use, the balance were eaten for broilers. Both the males and females were selected at the same time. All that were saved had the soft brown color and were evenly stippled all over.

The most beautiful Brown Leghorn female and the only kind that should win the honors in the competition, should be one of even shade of brown, neither gray or red; nor should they have a reddish cast on the wings. This reddish cast is termed "Brick Color," a reddish brown color found on Black-Red fowls. The proper Color Type for a Brown Leghorn female is one even shade of light brown, evenly stippled with a darker shade of the same color-evenness of shade of prime importance. The breast a rich salmon color, darkest at the throat, gradually shading into a lighter color between the thighs. The neck feathers should be golden yellow, with a broad stripe of black down the center; shanks and feet yellow—a shading of dusky yellow allowable on toes and a little above them.

DOUBLE MATING

The present type of Brown Leghorns can be produced only by double matings—the male and the female of this variety for exhibition, are as separate and apart as if they were not of the same breed or variety. To select and to keep matings for males and other matings for females is not nearly so difficult as it might seem. It is only necessary to keep a few breeding birds for producing exhibition males—more can be kept for producing exhibition females. We shall try to map out a plan that can be followed almost indefinitely and from which can be bred most excellent show specimens.

MATING FOR MALES

The best start one can have for this is a male that is fit for exhibition—one that has been bred from a line that has produced winners. This male mated to two or three females from his own strain will be a good beginnning. To test the breeding quality of this mating use trap nests, so as to know the hen that lays each egg. Hatch each hen's eggs separate and toe-mark the chicks, so you will know not only the father, but the mother of each chick. When they grow to maturity you can tell which hen produced the best cockerels and select her chicks only, both male and female for future breeding.

For a check mating, purchase eggs from someone who breeds the best males for exhibition. Hatch and toe-mark the chicks from these eggs and when they grow to maturity, compare them with you own best males for exhibition and keep for future use as breeders, either some of the males or some of the females, according to quality. If your own mating produces the best males do not keep for breeding any of the males from the purchased eggs, but select two females from these eggs, comparing them with the females that came from the hen in your own mating that produced your best male.

For the second year mate the original male with two of his own pullets that came from the hen that produced the best cockerels and with the best two pullets from the purchased eggs, mate the best cockerel with the original two or three hens, trap nest all the females, hatch the eggs separate and toe-mark the chicks. When the chicks have grown to maturity select the best males that are produced—keep the hens that have produced the best cockerels and a few pullets that have been bred from the same hens. If perchance the best have come from two females, this will establish two distinct lines of breeding.

For the third year—Mate the best cockerel to the one, two or three hens that produced the best males and mate the cock that produced the best females to three pullets selected from the females that produced the best cockerels the second year. Trap nest the females, hatch the eggs separate and toe-mark the chicks—select the best cockerels and the best pullets the same as before. Each year when you select, choose for size, shape, color and vigor. Never, under any conditions breeed from a male or female lacking in vigor, no matter how good they may be.

For all future matings use the best cockerel bred the year before. Mated with the best hens, only one of which can be his mother—mate the old male with his own

best daughters, select each one of them if possible from different hens. If proper consideration is given to the rearing of the chicks and to selecting for vigor, they can be bred in line this way for many years. If the chicks are hatched and reared by hens out in the open they will do the best. All chicks should be hatched between March 15 and May 1, and be kept growing continually.

When new blood is needed (which should be seldom), purchase the best cockerel you can get and be sure he has to any extent until they have been tried on one or two been line bred for several generations. Select him for size, shape, color and vigor and mate him with one or two of your own producing hens—not more; trap nest, toe-mark and select the same as with your own. No matter how well he may breed the first year, do not place too much dependence on his breeding qualities until after he has been bred the second year with two of his own pullets and his best cockerel with the two hens that were mated with the male that produced the cockerel.

MATINGS FOR FEMALES

Begin with a few females, of or near to the quality that wins prizes in the show. Mate with these females a male that has come from a strain that has been bred in line for pullet breeding. Be sure as to the breeding of all of them—some that are not so good, but that come from a line that produces the best are more apt to produce well than are better specimens of chance breeding. Above all be certain that you have both male and female from a strain that has for years bred show-winning pullets.

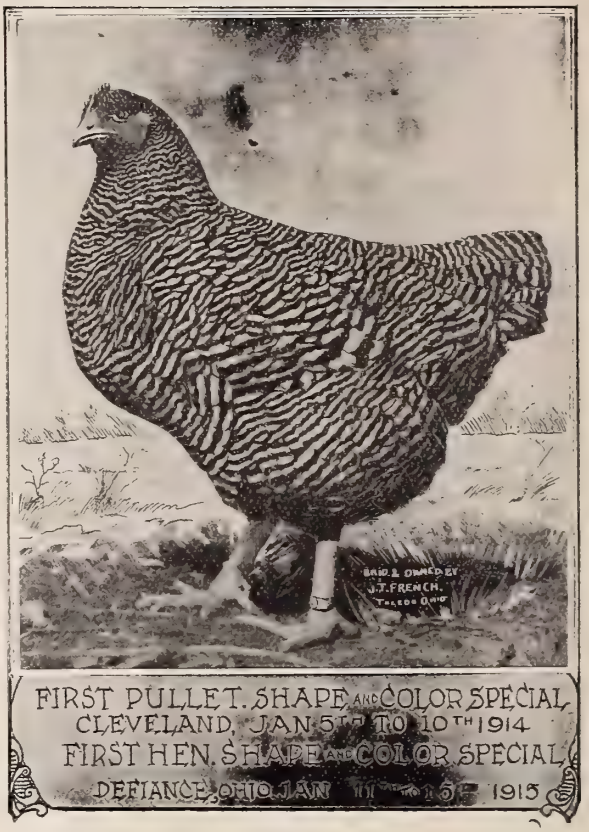
From such a start you will be at least five years ahead of any chance mating you can make. Remember that above all you must begin with the pullet-bred; the male to be bred deep in the same line. Next, hatch separate and toe-mark the chicks from each one of the females.

When the chicks are six or eight weeks old, select from among all the cockerels from two to four that have plumage as near like the plumage color of the best pullets of the lot, as you can find. If some of these pullets have the even shade of brown so much admired and one or two of the cockerels have plumage color nearly like them, you will have a good start. Put leg bands on these pullets and cockerels, save them for next year's breeding. Keep as well all the pullets that you care to have for layers. When all are matured, if the pullets were selected when chicks, have the best plumage color of all, and one or more of the cockerels that were selected at the same time, came from the same hen as the pullets, you will have a real producing hen.

Presuming that fairly good results have come from the first year's breeding, the first point to decide is—are any of the pullets better than the hens from which they were bred? If so, mate a cockerel that is a full brother to the best pullet, with the hens that were in the first-year mating and mate the cock with the two or three of his own best pullets. Trap-nest all the females used in both matings, hatch their eggs separate and toe-mark the chicks as before, when six or eight weeks old—selecting both the pullets and cockerels for color.

If the chicks are better than they were the year before, improvement has been attained. If the pullets from the hens mated with the cockerels were best, this shows that the female line is better than the line from the original male. If the pullets bred from the cock, mated to his own pullets are best, this will prove the line from the original male is the best. If all of the best come from any one of the original hens this will show that she is the best producer and her line should be saved.

If the offspring of the second year's mating is better than the original mating, the breeding in line can be continued. The same methods should be followed: Mate each year a cockerel that is a full brother to the best pullet, to his own mother and two or three of the best colored hens. In this way the cockerel will transmit the blood of his mother into other offspring through the hens and perhaps produce better than any from his own



mother. This kind of mating can be continued for many years, providing the cockerels used are selected each year from a different hen. When selecting the males and the females for breeders, select for size, shape, color and vigor. Remember that each is of equal importance and that it takes a combination of all to succeed—with vigor as of absolute importance. With vigor lacking success cannot come.

If success does not come from the original mating, try to get better results from some other source. It will not pay to waste much time on the breeding of this variety from stock that does not produce well. When a line has been established that breeds well hold to this line and select carefully for the best for future mating. When new blood is needed bring it into the flock through the best hen you can buy. Mate this hen to one of your own best males. Hatch the chicks separate, toe-mark the chicks and breed the offspring from this hen into your flock through the best females that come from her. Do not use the cockerels bred from her hens for several generations.

THE MILLSTONE OF DOUBLE MATING

Double Mating and What It Really Implies—The American Poultry Association and the Standard at Fault—By Mr. F. M. Prescott.

IN THE August issue of "Everybodys" I have read with interest Mr. Tormohlen's article on "Double mating and the Brown Leghorns," and as I see he is an advocate of the double mating I would like to present to the readers of Everybodys some of the evils of double mating as I know them after some 29 years' experience.

I refer to double mating of Brown Leghorns, Dark Brahmas and Barred Plymouth Rocks, which I have bred almost continuously since 1886.

I will start off with the statement that double mating is absolutely necessary with all three above breeds in order to breed exhibition specimens of both sexes as described in the Standard of Perfection.

There are many evils attached to double mating, so

let us take the worst one first, which in my opinion, is the swindle on the public at large.

At the thousand and one shows held annually throughout America we exhibit single specimens and exhibition pens of birds as near to the Standard of Perfection as we can breed them.

The public see these birds and exhibition pens and believe they are birds that when bred together will produce their own like. They even purchase a pair or pen with the expectation of breeding show winners for themselves and imagine their disgust when they find out a year later that the offspring are different in both sexes from their parents and fit only for utility stock or the butcher. Many, when they learn that two matings are necessary and that they must make another investment to purchase the male and females of the two lines, give up these breeds in disgust. Such cases are happening by the score all the time, a good instance of which is cited by Editor Curtis in the American Poultry World of June, page 651, center column.

Think of the financial loss to the breeders who have fowls and hatching eggs for sale; these double mated breeds are always the smallest class at the shows and for good reason, as most fanciers will not be bothered with double mating and the breeds are not so popular or so much bred as single mated varieties.

If in order to breed males and females of exceptional beauty in any particular breed we are obliged to use as mates birds that are so inferior in beauty that we are ashamed to show them together, then I say let us sacrifice a little of the beauty, giving it to the non-beautiful mate and by this compromise breed a pair of birds that may be shown together as breeders of their own like and of which we may not be ashamed.

This with a little good will on the part of fanciers of double mated breeds could easily be accomplished without sacrificing very much of the beautiful in either sex.

It is this going to extremities in order to produce a superlatively beautiful bird that has drawn Brown Leghorns and some other breeds away from the earlier single mating standards in which we already had a beautiful male and female. I am for improvement in beauty and utility in all breeds along natural lines, but when we must employ the unnatural method of double mating and not recognizing the other half of the mating in the Standard, I say it is time to quit improvement in any breed.

The next evil in importance, and it might be placed as the most important, is the injury done the breed by the public at large and who know naught of double mating.

The largest end of the poultry business is the utility end and thousands of hatching eggs and day old chicks are sold annually for this purpose. It is safe to say that in the utility end double mating is employed to small extent. Light and Dark Brown Leghorns and Barred Plymouth Rocks are mated together irrespective of any Standard and the result is the hodge-podge flocks we see all over the country.

Males, setting eggs and chicks are sold from these flocks and this non-standard stock is widely distributed over the country.

Some of it is exhibited, and some used for breeding exhibition stock and is advertised, innocently, for such purposes by the unknowing public.

When sooner or later they find out their error, many of them drop the breed with disgust.

Lesser evils and which tend to discourage the continuance of breeds requiring double mating might be mentioned, as follows:

Double equipment, one must have double the housing, yards and number of fowls required in single mating. This alone is a big item of expense and really means a further evil of double investment from which the returns are not so great as from single matings as one-half the fowls raised do not have an official value for show purposes and most of them have to go at utility prices.

Double work is the next evil. Think of the labor of carefully pedigreeing and mating ten breeding pens and then think of doing that work again as must be done with double mating. In my case, with three breeds that require double mating I must do it six times instead of three.

Double investment is no small evil and the reason many a fancier drops the breed, as they cannot afford the bouble cost of breed, plant, etc.

Double advertising and printing, for if we would be honest with the public we must uncover this swindle and tell before hand that Brown Leghorns are in reality two distinct breeds that cannot be bred together and produce Standard specimens.

The A. P. A. makes a great hue and cry about standing for square deals between its members and dropping from membership those found guilty of unfair dealings, yet the A. P. A., by continuing to publish a Standard or Perfection requiring double matings is guilty of fostering one of the greatest swindles in the poultry business.

We get by mail an order for a set of hatching eggs or a pair of breeders. What shall we send, a setting from one mating and a pair that will breed their like and let the party find out later that he has but half the breed, or shall we divide his setting eggs between the two matings which must not be bred together?

We get an order for a pair for a show and we send them, but when the purchaser tries to breed from them later on, his show business is stopped right then and there.

The public visit the shows for education and they see the prize winning specimens, male and females and even see exhibition pens with both sexes together. What misleading information to show birds in the same coop that cannot be bred together.

If the shows want to be honest with the public, let them refuse to show exhibition pens of the double mated breeds and let them provide two classes for each such breed, viz: Brown Leghorns, male line, Brown Leghorns, female line, then if you wish a breeding pen in each line

The A P. A. stands for honesty in shows and to a certain extent controls them by a set of rules. Let them include rules to carry out the above and they will go a long ways towards righting the wrong they are forcing on the poultry world thru the present Standard.

Personally, I believe double mating should be eliminated as far as possible, but when a breed like the Barred Rocks has gone so far with it perhaps the simplest remedy would be to admit both matings to the Standard under Light and Dark Plymouth Rocks, but for Brown Leghorns, Dark Brahmas and those breeds having dark Brahma color standards, I would advise a compromise in the color description of both sexes and going back to a single mating.

This is something for specialty clubs to consider and take up with the A. P. A., as I am convinced that future changes in the Standard will be mostly along the lines recommended by the specialty clubs in their respective breeds and which is as it should be, as I cannot see the justice in A. P. A. members voting on Brown Leghorn Standards when they have never bred them and haven't the least inkling of what the color requirements should be. I would feel just as competent to vote on changes in the Chinese language as on the color changes in a breed I had never bred.

I consider this double mating a sort of cancer on fancy poultry. Let us apply the only remedy, and cut it out.

Ed. Note—This is the most reasonable Anti-Double Mating article we have ever seen. It is by Mr. F. M. Prescott, Riverdale, N. J While we personally absolutely favor the double mating of Barred Plymouth Rocks, we will admit that double mating has been carried to an extreme limit in some of the other varieties, and in some of the solid colored varieties as well. Wishing to give our readers the benefit of every side of all questions we gladly publish this article for their consideration, and ask for more, both pro and con, on this interesting subject. Lets thrash this question out well.—H. P S.

PATHS THAT CROSS

How nearly we miss, as we come and go,
Both the love and the friendship of life;
Catch glimpses of faces we better would know,
Yet pass them like ships of the night.

A word, a smile, maybe a clasp of a hand,
Or we see through eyes to the soul—
We cannot explain, but there is a band
Which we feel would through lifetime hold.

Or it may be the paths for one brief day
Will lead us along side by side—
Just a glimpse in each life before the way
Causes the paths to diverge far and wide.

And somehow there's left an ache in the heart
As we wish again and again
That these paths would not lead so far apart—
Heart hungry for love and a friend!

—Lucy Hughes Doak

OUR GUARANTEE

We guarantee every subscriber against loss due to fraudulent misrepresentation in any display advertisement appearing in Everybodys Poultry Magazine providing the subscriber when ordering the fowls or merchandise states that the advertisement was seen in Everybodys Poultry Magazine and places the order during the month or months in which the ad is inserted in our columns and notifies us of the fraudulent misrepresentation of the advertiser, giving full particulars, as soon as it comes.

Fifty cents the year. Three years for $1 in U. S. and Mexico. Canada, 25 cents per year extra. Foreign countries, 50 cents extra.

A renewal blank will be inserted when subscription expires.

ADVERTISING RATES ON APPLICATION

SAMPLE COPES sent free to all interested. Subscription agents wanted.

Manuscript and copy for change of advertisement must be in our hands promptly by the 10th of the month preceeding date of issue. New business can be accepted to the 20th, but no special position can be assured.

WHEN WRITING ADVERTISERS ALWAYS MENTION EVERYBODYS

The Average Egg Yield

The reports tell us that the average egg yield of each hen in the United States is seventy. We accept these figures gladly for it shows an average increase of twenty-three eggs per hen per year gain during the past fifteen years. While to those unacquainted with general conditions, this must seem to be a very small average for the American Hen to produce in eggs during the 365 days of the year, it still is a gratifying gain that pressages more results for the near future. These figures have been compiled by the government in its regular way and along the same lines followed for years and no doubt are as near to being correct as it is possible to obtain them, while they may not be positively exact, we are assured that they are not inflated.

If memory and record serves us correctly, the census of 1900 showed an average egg yield for the preceding years of forty-seven eggs per hen per year, while that of 1890 an average of forty-one eggs and that of 1880 thirty-seven eggs per hen per year, so while the late records are still reasonably small and far from what we can hope to expect, they still show a magnificent increase and a substantial gain over the years of the past. In them we can easily see the effect of better and improved stock as well as that more attention is being given to poultry production, that proper methods are becoming more popular, that knowledge and interest have been increased, and that a field for standard poultry production is ever before us, to be opened as knowledge and interest is extended among the breeders and farmers.

That there is no limit to the successful poultry breeding with profit assured, is evident at this time more than ever before, that which has been accomplished being mainly due to natural conditions, to a natural demand, but this is the age of progress, and the gain shown above is the proof that the poultry breeders have also been up-and-doing for the past several years.

Conducive to the present conditions are several reasons for us to consider. The poultry magazines and journals whose epistles on the possibilities of poultry production have awakened renewed interests in every section of the country, while the magnificent work done at the several State Experiment stations in diffusing practical knowledge that is so readily accepted by the general public to profit by, the egg laying contests that have opened the way to a study of foods and of the results, all have had their effect which has proven of general advantage to the breeders in general throughout the world.

But for all this, and more than to any other cause, for both the results and interest seen today in poultry, credit is due to the great number of sound reliable and successful men and women breeders who have devoted their life to poultry breeding, who have led the way and with their personal success have shown its possibilities. There are hundreds of those who well deserve the best we can say of them for their examples and work has led many others to contentment and to success.

The above figures simply show, to our mind,

the increased attention to poultry production during the past few years. This interest should be further greatly increased and the average egg yield per hen doubled. If but one of every twenty or thirty breeders would study conditions and his possibilities of greater profit, with the lessons freely handed him, then the average would soon reach to one hundred or more eggs per hen per year. While an increase of about thirty per cent. in the past fifteen years is a wonderful record to make, it is still one we should and must improve upon. We can best do this by displaying more real interest in one another as well as in poultry and in a greater confidence in all mankind. Now let us all "Boost" for more Standard Bred Poultry and for the American Hen that will average One Hundred or more eggs per year. H. P. S.

Can Success Be Assured?

Can success be assured in the poultry business, is the question we were asked in a letter lately received, and one we were inclined to answer both ways, at first thought, and still believe it to be the proper reply to make. We unreservedly answer yes to this, if you are willing to work and try, and no if you are not quite so willing.

In every line of work and business, the success made by some is equalled by the failures of others, for there is no one line of endeavor, that we know of, but that requires some skill, a great amount of common sense, personal attention, grit, nerve and staying power, and with all these, unless the parties are willing to work for themselves just as hard and as long as they have to labor for others, then they had best stick to their job and continue drawing pay from others.

The question of success is entirely up to the individual, if he is earnestly willing to have success beam upon him, and by his work is worthy, why then it will. This good old world is full of opportunities, good ones, and right now, as many or more than ever before. So peel off your coat and try, for success is worthy of it all.

To our mind, poultry raising holds out more and better inducements than does any other line of live stock, or any of the mercantile lines. While its breeding for results and improvements is a study and its feeding for equal results is an art, both can be very successfully mastered in a very short time, to an extent at least to insure results from the start.

There are no great secrets to learn, regardless of the many so-called "Poultry Secret Books," and dope sheets issued at a price. A strict attention to business, with business ability and willing hands to follow the dictates of common sense will insure success.

Poultry work is attractive; its first experience has exceptional drawing power for all. Then if you love the work and find it congenial it becomes more adhesive and will stick as long as life lasts. Its variety is charming and its prospects are always noticeable to the one who keeps busy and pegs away carefully, observes and tries, with the best there is in him for success. The man who fails with poultry would be a rank failure in any business, for he would surely lack personal ambition and personal courage.

One of the most successful breeders of this day said to me less than one year ago: "I am never so happy as when working with my chickens," and we found him right at it. This was not because he had to, but for the reason that he wished to, it was his desire to be and to work with his birds, their very existence had a part in his life, so why should we wonder at his success, or those like him.

In poultry we have a line that no conniving can corner; a line whose market depends upon quality, a business that anyone can enter, for it does not matter how large or small your plant is, it will show you profitable returns for your work and investment, if you will TRY. H. P. S.

Too Many Varieties

This world is full, (to a very small extent) of people who talk and act different, who live by being different, by being self-constituted official critics of all that happens, and of some things that never happened nor ever will. Thank goodness that they belong to the great minority who can never harm much. For some years we heard more or less rambling statements that there are too many Standard varieties of poultry. This question is just as narrow as is the famed (?) rule 17 question, which has gloriously helpd to cheaply fill the pages of two or three of the poultry papers with matter for their readers to pass over in the hopes of finding some sound poultry articles and news to read.

Of course we cannot agree with those who seem to believe that there are too many Standard varieties, for we never had cause to question the merits of any accepted standard breed or variety. That all have positive merit and particular value, goes without saying, for quality to reproduce themselves and the general quality to breed true to shape, color and markings combined with breed characteristics, has always been considered whenever a new breed or variety received its standard diploma.

But suppose we were to now eliminate half or more of the standard varieties, where would we start and who would start it? Then, after all was done would the few be satisfied, particularly if their favorite "Florida-Flumers" (?) were one of the varieties eliminated? We think not; there would be more of a howl than ever. . If this work were really ever attempted, consternation would reign complete, and there would be more of an upset in every city of America than there was in Jerusalem when "Baalem went through on his Ass." Please deliver us from even such dreams.

In the varieties we have, equal opportunity is offered and the selection of personal likes in shape, color, markings or characteristics are being supplied. We do not all think alike, nor do we all believe alike, and the breeder who admires the Red Cap or Spanish, or any other variety, has just the same reason for liking and breeding them, as others have for the Rocks, Reds, Orpingtons or Leghorns, and also has equal right.

The several varieties add a stimulus and increased interest to the fancy, they do not detract from it.

they are, in fact, a real necessity, for fancy in humans has no limits. Let us have all the worthy breeds and varieties possible, so that we may broaden and extend this great poultry industry of ours that has been built up on a broad and liberal minded plane for all tastes, notions and fancy to join and to enjoy and to profit by. H. P. S.

Great events do happen, even in these days of war, that have no bearing upon the great conflict that is being waged across the water. We are particularly pleased at this time to announce to our readers that we have successfully completed arrangements with Mr. Theo. Hewes, Indianapolis, Ind., to supply for "Everybodys," a monthly article and to report the poultry exhibits of the West and Mid-West that he will attend.

Mr. Hewes requires no special introduction to poultry fanciers or breeders. He is known the world over as a Judge, Author, Editor and as Secretary of the Chicago Show. We consider him to be one of the best authorities, as well as one of the ablest writers of this time. We look with personal interest to his connection with "Everybodys."

Then, we have also arranged to receive a monthly article from Mr. T. F. McGrew, another of the famous Old Guard who have devoted their life to poultry and its interests. Mr. McGrew has been known as a brilliant writer for more than thirty years. He is the author of the breed books issued by the United States Government, and as the principal author of the International Correspondence School Books and lessons. He also is an old time breeder and a judge of national reputation.

We are doubly pleased to introduce Messrs. Hewes and McGrew to you. There is nothing too good for "Everybodys'" readers.

H. P. S.

There are no longer any abandoned farms in Connecticut. This is officially stated. "There's a reason," Advertising. A few years ago such farms were plenty in that st te, as they are today to a considerable extent in both New York and Pennsylvania.

Thousands of Connecticut farms have been bought in recent years, principally by wide-awake Europeans, who, being accustomed to land service there, naturally sought farms on their arrival in this country. They have taken hold of these old farms, many of which were well worn out, at sacrifice prices, and by diligent labor, together with wise and up-to-date methods have restored them to productiveness, and today are yielding a fair living, with prospects good, according to the reports of the State Agricultural Authorities.

There are many farms in the middle and northeast sections of this country which have suffered depreciation in quality through "land poor" policy of taking everything the land will give and returning nothing to the soil. Th e farms have been abandoned by their thriftless owners, or are for sale for what they will bring. But the owners of these farms cannot of themselves find buyers, and the probable buyers do not know where they are. Advertising is the link which can bring them together.

Advertising found buyers for these old Connecticut farms, and advertising will do the same in bringing buyers for farms in other sections of this country.

The growing tendency of "Back to the Farm" is becoming more manifest every day. The busy town and city business man are looking forward to the time when they can settle down on a little land of their own, and there enjoy to the full, the pleasures of a country home, and with advanced ideas of agriculture, make the farm which was purchased at a sacrifice, a profitable investment. Poultry keeping will hasten this success and add tenfold to the pleasures of country life. J. T. H.

Readers of "Everybodys" can well imagine that Birds and Bird-Life is of special interest to us and it no doubt also interests several thousands of our readers as well. It would interest every person if they would but give it a little extra thought. One of the best crops that we possibly could raise would be more birds. Birds everywhere would insure more pretty things, more joy, more protection, greater and better crops and more prosperity. Year by year we read of the Fruit Blight, of the ravages of the Wood-boring Beetles, of the Caterpillars, Grasshoppers and many other harmful and noxious kinds of insects that seem to increase yearly and to add increased loss of millions of dollars to crops of grain and fruit, as well as to our forests and grass lands.

You can call them thieves and pillagers; but know
They a e the winged wardens of your farms,
Who from the corn fields drive the insidious foe,
And from your harvests keep a hundred harms;
Even the blackest of them all, the crow
Renders good service as your man-at-arms,
Crushing the beetle in his coat of mail,
And crying havoc on the slug and snail.

H. W. LONGFELLOW.

The protection of the birds is the prime requisite for increasing their numbers and the results of protection will be in direct proportion to the amount given. We should insure the birds against every form of human persecution and defend them as well from their natural foes. Bird houses should be built and at seasons food and water supplied. Extend to them a welcome and they will respond with graciousness, with useful work and with song.

Monthly, under the heading, "Our Bird Neighbors," we aim to give information of the different varieties of birds that inhabit this country, along with their habits, feeding, etc. We wish you to become better acquainted with "Your Neighbors" of song, knowing that the more attention you give them, the more you will enjoy them. H. P. S.

We are still very well pleased—thank you, at the continued progress that "Everybodys" is making. We welcome our new subscribers with real gladness and while our family circle is rapidly increasing, there is always room for more. It is very evident to us at this time that our contract for 45,000 copies monthly will soon have increased, so let me tell you here and now, that we are willing to comply and to double it if necessary for we have both the desire and the capacity to serve well all that come.

We are incorporating some new features this month and believe we will have more again for our next issue, but be that as it may, you will find us abreast of the times and giving to our readers the greatest possible value for their money. Let me here again urge you on to do your best for poultry and all its interests. Join the specialty clubs that represent your varieties, join the American Poultry Association, and in every way seek to better poultry interests, for better organization and for greater success.

But in all your work don't overlook "Everybodys," talk it at your meetings and to your friends for you can serve poultry's best interests by having a personal interest and pride in "Everybodys."

H. P. S.

DON'T FAIL TO READ
"A HELPING HAND".

By Estelle E. Collier, in our October issue. In this Mrs. Collier has done her best work.

FEEDING FOR EGGS IN WINTER

By Prof. Harry R. Lewis—a masterpiece in Poultry Literature of extraordinary value.

Theo. Hewes will also have his first article in our October issue. Don't miss an issue. Make "Everybodys" a part of your home and success.

MORE BIRDS, FEWER INSECTS

The present bird population is much less than it ought to be, according to the biologists of the department of agriculture at Washington. If birds were given more protection and encouragement there would be an increase in numbers, which would be accompanied by a corresponding decrease in the number of insect pests.

That breeding birds prefer thickly inhabited centers of population to forests, is one of the conclusions of the census. This seems to refute the widespread belief that humans and birds are antagonistic. It also seems probable that as our human population increases so will our bird population.

* * *

EGGS FROM CHINA

Last year there was considerable discussion in regard to the possibilities of cheap eggs from China demoralizing the egg markets of the United States. It was claimed that within a short time our markets would be overrun with Chinese eggs. Owing to the breaking out of the war in Europe these predictions have not been realized. According to figures published in the consular reports, during the first three months of the present year, 410,760 dozen Chinese eggs valued at $64,027, were exported from Shanghai to the United States during the first quarter of 1914 were 1,818,737 dozens, valued at $305,710. The entire total for 1914 shipped to our Pacific seaboard from Shanghai was 3,000,000 dozens, valued at $540,000.

The Chinese farmer in the Shanghai districts receives for his eggs about $4.50 per one thousand, the price varying according to supply and demand. The Shanghai merchant resells these eggs to local exporters at $6.25 to $8.00 per one thousand.

At Nanking eggs are purchased by the local exporters at 40 to 42 cents per gross, for export to Pacific coast ports. The eggs are laid down in San Francisco, Seattle and Tacoma at about four cents a dozen.

There are no specialized egg farms in China, the egg being laid by hens in small flocks on farms devoted to general farming. The territory around Nanking produces 75,000 dozen eggs daily for export, and there are other large egg producing districts.

These figures indicate that under normal conditions the importation of Chinese eggs has within its possibilities some elements of peril for the poultry industry of the United States. But Chinese eggs will never affect the market for strictly fresh American eggs.

* * *

AGRICULTURE IN SCHOOLS

The teaching of agriculture gains momentum throughout the country. Fought at first by educators, but steadily promoted by farmers and granges, the study is fast gaining a foothold in schools and colleges. It is significant that our state universities are now adding summer courses for teachers, in which agriculture shall have conspicuous attention. West Virginia is the latest state to take an advanced position in this respect. Beginning June 21, when the summer school opens, agricultural courses will be offered to all teachers who attend. It is expected that a large number from both high schools and common schools will take this work.

The teaching of agriculture really embraces the whole of a teacher's art. It is a pervasive and exacting subject; at the same time it embodies the most important aspects of character building, for in teaching pupils scientifically to plant, cultivate and harvest farm crops and to care for farm animals, they are being trained the most valuable lessons of life. Teaching agriculture in schools is no longer an experiment. It has been amply demonstrated that those persons who have had special training along lines of agriculture are able

Meet Everybodys

Representatives at the Fall Fairs and Winter Shows

We are now completing a list of Fairs and Shows for our Representatives to make and hope to publish this in our October issue complete. Our

MR. HENRY P. SCHWAB

will attend the following Fairs:

Forest City Fair...Aug. 19-26
Rochester, N. Y., Expo. Aug. 30 to Sept.11
Albion, N. Y.....Sept. 8-11
N. Y. State Fair...Sept. 14-18
Allentown, Pa.....Sept. 21-24
Trenton, N. J.....Sept. 27-30
Brockton, Mass.....Oct. 5-8
Hagerstown, Md.....Oct.12-15

And some others.

Winter Shows

Brooklyn, N. Y.....Nov. 16-20
Buffalo, N. Y.....Nov. 23-27
Baltimore, Md..Nov. 30 toDec. 4
Palace N. Y., Show...Dec. 7-11
Guelph, Ont.....Dec. 10-15
Philadelphia, Pa....Dec. 14-18
M. S. G., N. Y., Dec. 31-Jan. 5
Boston, Mass.....Jan. 11-15
Pittsburgh, Pa.....Jan. 18-22
Indianapolis, Ind....Feb. 7-12
Vineland, N. J., and others.

not only to make this subject a vital one in the school-room but in the community as well. Every summer school and teachers' institute should provide instruction in agriculture, farm arithmetic and allied subjects.

* * *

PRESERVING EGGS

As it is becoming more and more necessary for eggs to be held over from season of scarcity, cold storage and home preservation of eggs are attracting more attention. The former prejudice against eggs which are not strictly fresh is gradually dying away as customers learn that eggs held under proper care for a reasonable period of time are as good for general purposes as those which are newly laid.

Many methods of home preservation of eggs have been tried. Among the various ways are: Packing eggs in dry table salt, bran, oats or sawdust; preserving them in dry wood ashes, powdered sulphur, powdered gypsum, salt brine, slaked lime and salt solution, sugar, lime water or various solutions of waterglass; and covering with vaseline, parrafin, patented preparations, butter or lard. Potassium permanganate, sallicylic acid, gum arabic, formalin, etc., are preserving mediums which have been tried, but proved dangerous to use.

Of all these methods, the lime water and salt solution and the waterglass solution seem to give best results. The lime water and salt solution can most conveniently be made by shaking four pounds good quicklime in a small quantity of water. With this is mixed four gallons pure water, two pounds salt are added and the whole mixture is thoroughly stirred and allowed to settle. The clear liquid, which is the part used to preserve the eggs, is poured off. This rule gives enough mixture to preserve 30 dozen eggs, although the number of eggs which a container holds depends somewhat upon the shape of the vessel. This method is one of the oldest ways of preserving eggs and is considered reliable.

Possibly the waterglass preservative is more generally used. It is made by mixing 1½ quarts commercial waterglass solution, which may be purchased at any drug store for about thirty cents a quart, with 18 quarts pure boiled water. The mixture is stirred until the ingredients are thoroughly mixed. An earthen jar is the most suitable container, although a tight wooden tub may be used. Two eight-gallon jars are sufficient for 30 dozen eggs, using the quantity of solution prescribed in the above formula. If needed more water is added to cover the eggs.

* * *

THE SMALL AD AT WORK

David and Goliath is an old, old story; but it applies to so modern a thing as advertising. Better thirty lines of brain than seven columns of brawn.

The set-to of Gulliver and the Liliputians has a still broader analogy. The advertiser who puts out a hundred skillful little "ads" through the year is likely to bring down far superior results than the man who splurges once or twice on full pages that are not so cleverly calculated. The "repeater" in advertising has the advantage of the "repeater" in anything else: given a constant variety and a constant originality, he wil set the reader looking for a little "ad" every day.

* * *

HENS ENLISTED IN ARMY

The old mother hen has at last reaped the reward of suitable honor for her devotion to her own downy flock. The British Government has installed hens in many palces as a guard against aeroplanes. Generations of experience against he predatory hawk has trained Biddy's eyesight so that she can detect flying machines before anyone else. All that the soldiers have to do is to watch the hen, and then get busy.

"Don't Miss a Single Copy.

THE CERTIFICATE EGG

In our present-day demand for pure food, prepared and put up under strict sanitary conditions, delivered in germproof containers grom a germless market stall, by a sterilized hand, and for milk from cows with a clear bill of health, stabled. fed, watered and milked and the milk delivered at our doors in accordance with health board regulations, we accept anything in the shape of an egg without a thought of the health of the hen that laid it, the sanitary conditions under which she was housed, the kind of water she drank or the kind or quality of food upon which she subsisted, whether she was allowed to follow her natural bent as a scavenger of the depest hue, or whether she was prevented from doing so—our sole demand is that the egg be "fresh laid."

In the light of experience the writer feels safe in voicing the opinion that many times the market man is erroneously accused of supplying "stale" eggs to his customer at a "fresh-laid" egg price.—E. M. L.

SEPTEMBER

1, 1912——Protonuclein Beta, indicated in Tuberculosis perfected.
2, 1879—Treasury Department organized.
3, 1783—Treaty of Peace with Great Britain signed.
4, 1752—New style calendar adopted, 11 days dropped between 2nd and 14th of September.
5, 1751—First Theater opened in Virginia.
6, 1620—Pilgrims sailed in Mayflower.
7, —Labor Day.
8, 1894—Helmholtz (Theory of color blindness) died.

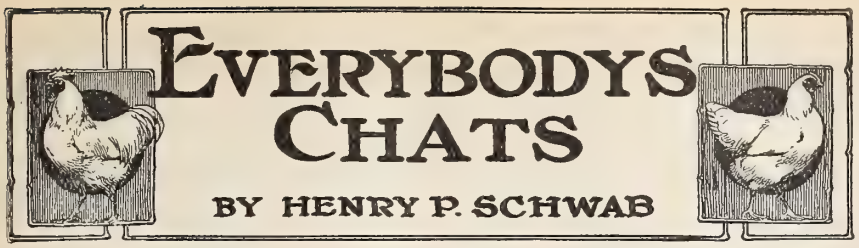
THE CONSTANT

use of advertising space in "Everybodys" will bring large returns and satisfactory results. Investigate the service we give you with the cost. "Everybodys," the magazine of class, welcome in every home.



September, the show season of 1915-1916 is on, arrange now to attend several fairs and shows and to exhibit your stock.

* * *

Look around and observe, ask questions, and don't go home until you have gained the information wanted.

* * *

While there subscribe for Everybodys, and ask your friends to do so, too, they will thank you for this kindly advice.

* * *

Be persistent, but never stubborn.

* * *

The Forest City Fair opened the season with a feature poultry display, complete in all classes, here was seen a fair run of the quality we can expect to see at the later shows, it was very good.

* * *

When a man begins to lose ground he is naturally dissatisfied with his lot, and with that of every one else, too.

* * *

The poultry business is quite safe, notwithstanding the efforts of two or three editors keeping things all mussed up all the time. The man who is honest in heart has all confidence in his fellow man.

* * *

If at first you don't succeed,
Don't sit down and cry,
Just sit up and look around
And find the reason why.
No use to get discouraged,
No use to sulk and cry,
But wear a grin and wade right in
And have another try.

* * *

A good purpose will lead us all right, if we will but follow that purpose without any hesitation.

* * *

Our visits to the homes of several breeders each month has shown a gratifying quality of stock, with the usual numbers and a greater confidence in the future possibilities of poultry production.

* * *

It's a very short step from cunning to rascality.

* * *

Have you noted our clubbing offers? We can make you a combination of any papers, books or magazines you may wish for and save you money.

* * *

We expect to have some surprising announcements to make in either this or in our next issue, for we are moving fast and are leaving no work undone that will insure our readers and advertisers the best quality of service and value to be had.

The silver lining to a great many clouds is nothing but moonshine.

* * *

Hewitt—I don't believe in women belonging to clubs and learning about parliamentary law.

Jewett—Why not?

Hewitt—My wife knows too much. The other morning she said: "I wish you would rise to a question of personal privilege and make the fire.

* * *

The average annual egg yield of each hen in the United States is just seventy, according to latest reports, while the record is said to be 303. Some difference in these figures worthy of consideration.

* * *

The progress made by Everybodys is most pleasing, having more than doubled our circulation since April. We have now contracted for and are printing 45,000 copies monthly, and this will most likely have to be increased very shortly to supply the demand which is coming strong from every section of the country. We are prepared to go to any number, having our own plant with unlimited capacity we are ready to go the limit. We want everybody to have and to read Everybodys.

* * *

The roar of a waterfall is produced almost entirely by the bursting of millions of air bubbles. There have been many hot-air bubbles bursting in poultrydom for some time.

* * *

Of late the rains in the east have been a handicap. They have been unusually severe and the loss at some plants has been quite large.

* * *

The winners of "Everybodys Cups" will have a home ornament to be proud of. We expect that upwards of 150 of these cups will be offered throughout this country. Interest yourself in your home association and see to it that an effort is made to secure one or more of these cups.

* * *

Nothing the matter with living,
Everything humming and bright,
Tender and sweet and forgiving,
Hungry for beauty and light.
Old world shining with glory,
Meadows and mountains at rest,
And love with her wonderful story
Whispering dreams in our breast.

* * *

Let me call your attention to the style of ad-setting in this magazine. Just look over the ads and note their class in make-up, that's all.

* * *

Send us your copy early; we will have it set for you and send you proofs for approval and for use in other journals, if wanted. We have done this for others and will also accommodate you, as well.

* * *

There is special advantage in this kind of advertising, so call upon us for any special service, now or at any time.

* * *

"How do you know that Blinks has had a raise in salary?"

"He argues that the world is getting better, that the danger from monopolies has been greatly magnified, and that human nature isn't so bad after all.

* * *

Love cannot be bought or sold, but it can be exchanged.

* * *

Note elsewhere a list of the Fairs and Poultry Shows we hope to make. Make an effort to meet us. We still have several good opportunities to offer those who wish to represent

EARLY COCKERELS AND PULLETS

All over the country beginning with early September, large Fairs are held. The poultry exhibits are always of great interest to the crowds and the attendance at these fairs is five to ten times as great as at the regular winter poultry shows. If you are not in shape to make an exhibit why not let me fit you out with a string. Early chicks are scarce, but I make it my business to have plenty of them. As a business proposition you cannot afford to overlook this opportunity. A large winning will bring you plenty of orders for stock and eggs. Nothing will attract prospective buyers more than fine, well matured cockerels and pullets at the early shows. That I can furnish you with the necessary quality is shown by my own winnings at the New York State Fair, covering a period of ten years. While I get out a large number yet my supply is not unlimited and you should have your birds reserved early. As a rule prices do not range as high as they do for the winter show winners. Fine show cockerels range in price from $10.00 to $25.00, and pullets from $8.00 to $20.00 Exhibition pens, $25.00 to $75.00.

FREE—Send for catalog and summer sale list, giving description of several hundred breeders I am offering for sale.

Send one dime for the Regal White Wyandotte Book, telling all about White Wyandottes.

JOHN S. MARTIN BOX D PORT DOVER, CANADA

Riley's Barred Plymouth Rocks

I have some bargains in yearling Hens and Cocks, either mating, of my choicest breeders the past season.
Also some wonderful youngsters ready to win your early show.

HENRY D. RILEY
Box C Strafford, Chester County, Pa

Do it now—that little job here and there, whenever you happen to think of it; there is no time like just now.

* * *

Gather and clean your brood coops, spray and whitewash them, have them all ready for next year.

* * *

We still have some excellent opportunities and good fairs and shows to offer representatives. You can more than pay your way, by doing a little work for us. Write us today for terms, etc.

* * *

Campines are coming to their own we judge by the increased general demand for them and the hustle of those breeding. Them. The better their good qualities become known, the more popular they will become and the efforts of the breeders are now directed in the right way.

* * *

Mr. John S. Martin, Port Dover, Ont., is in Frisco doing the fair along with Mr. Frank Hering, of South Bend, Ind. While Jack is so far away we will acknowledge that the Chicago story was only in jest. It is quite natural to pick good fellows to shoot at.

* * *

Start every day with a smile.

* * *

Those who are agitated over spooning in the city parks may take heart. A Boston physician predicts that fifty years from now "kissing will be considered barbarous."

* * *

Billie Russell advises us that all is serene at the Expo. and that they are planning for a big entry and a great show in November. Between H. H. Collier and W. S. Russell the excitement won't fag and a very pleasant time is assured to all poultrymen.

* * *

During our last trip to New York we noted they were breaking ground on Broadway. Our first thought was that it may be for that expected monument at 26th street, but we later learned it was for the new subway. (————)

H'm! So General Scott is going down into Mexico. Well, good-bye, Villa! Good-bye, Carranza! Good-bye, the rest of you! Hope your crops turn out well!

* * *

Carrots, says a beauty hint, are the best food for a good complexion. Yes, but what's good for carrots?

* * *

Prof. Harry R. Lewis, of the New Jersey experimental station is again at his home, after having quite fully recovered from a severe case of blood poisoning which attacked him on his vacation. We are happy to know of his recovery and will now expect more good things for our readers.

* * *

Sol may sizzle and Sol may stew,
Old Sol may dance and feint;
But not a thing can Old Sol do
With her complexion paint.

We feel that we have special reasons to congratulate ourselves in having secured Mrs. Estelle E. Collier as our western representative and contributor. As we could not get Harry H., we gladly took his wife and we now have every reason to believe that we have the best in that family.

NOTICE

HAGERSTOWN CATALOGUE

FOR two or three years past the Great Hagerstown, Md., Show has NOT had a catalog of entries or of awards. We consider this a necessity and have now arranged with the management to issue their official catalogue.

To make this a success and a future feature, we now ask the breeders and exhibitors to give their support by taking space and advertising in this catalogue. The rates for the space are:

For full page.....**$5.00.**
For half page.....**$3.00**
For quarter page...**$2.00**
For one inch space....**$1.00**

We hope to receive your support in this. Do this for Hagerstown. Send your order and for any further information address,

Everybodys Poultry Magazine,
Hanover, Pa.

Comes the news that a spite fence man over in Jersey is now in jail, and in fancy we can see his next-door neighbor taking him nice peaches, angel cake and things like that.

We don't wish to tell you that we have in Everybodys the best poultry magazine in the whole world, but—You just read through this copy and any of our others, then draw your own conclusions.

* * *

Note mention of some special feature articles to appear in our next issue. There will also be many more of value and of interest. Don't miss a copy of Everybodys. You'd better miss some meals.

THE CONSTANT

use of advertising space in "Everybodys" will bring large returns and satisfactory results. Investigate the service we give you with the cost. "Everybodys," the magazine of class, welcome in every home.

GOOD WHITEWASH FORMULA

First clean the chicken house thoroughly. Whitewash will cover up dirt, but will not destroy it. The following is a good formula for a brilliant whitewash which can be put on either with a spray pump or with a brush or broom. It works a little easier with a spray pump and is easier to apply. Half a bushel of unslaked lime, slaked with warm water, cover it during the process to keep the steam and strain the liquid through a fiine sieve strainer. Add a peck of salt previously dissolved in warm water; three pounds of ground rice boiled to a thin paste and stir in boiling hot; half a pound of powdered Spanish whiting and a pound of glue which has previously been dissolved over a slow fire. Add five gallons of hot water to the mixture, stir well and let it stand for a few days. Cover up to protect from dirt. It should be put on hot. Coloring matter may be put in to make it any shade, Spanish brown, yellow ochre, etc.

HESITATE

For not a single moment if you have anything to sell. "Everybodys" will find the customers.

Big Leghorn Sale

5,000 Pullets that will lay in October. *1,250 Yearling Hens*—already splendid layers. *500 Cockerels* full of vigor and of great size.

These are all high class birds, bred especially for size and egg production. We also offer you for the late fall and winter shows

NOTES *and* COMMENTS

BY H·P·SCHWAB

Fair Premium Lists are arriving by every mail and it is gratifying to see the complete classification with cash and specials offered on poultry. We well remember that our first exhibit was made at a fair way back in 1885. and for winning First Prize on a pair of chicks we received a blue card and fifty cents. We still have the card, but long since have lost all track of the money.

* * *

Things have changed, birds are now shown singly at all fairs and shows and real dollars are offered as prizes along with beautiful cups and other specials. Now also there are large and roomy building with competent officials and judges at all, while formerly any old place did for the poultry show and a committee of wise (?) men placed the awards. Yes, we have much to be thankful for.

* * *

We thank Mr. John A. Gaugh, Secretary of the Houdan Club, for a set of the club catalogues. These surely will prove very interesting and of value to us in many ways.

* * *

Haven't had the time to look through our 1915 Standard as yet; it looks good from the outside, and rather wise.

* * *

The catalogue and special sales list of Mr. C. E. Spaugh, Rugby, Ind., should interest Barred Plymouth Rock breeders who are looking to buy stock. Mr. Spaugh has a fine line to offer at this time.

* * *

The R. T. French Co., Rochester, N. Y., makers of "French's Poultry Mustard," are putting out clever advertising. Their goods have been on the market for three years and during all this time every user we have met with has highly recommended its regular use for poultry. Its virtues are many and it is without question giving absolute satisfaction.

* * *

Mr. Chas. F. Rankin, Pittsburgh, Pa., owner of the Schenly Heights Poultry Farms, writes us under date of August 11th: "We hatched at our farm over 15,000 peeps this season, and we are now making arrangements for at least 50,000 next season. My Hall Incubator did good work and I now intend to increase my incubating capacity to 20,000. We have a very fine lot of birds coming along rapidly."

* * *

Letters like the above require no special comment; they speak for themselves. Yes, things are picking up all the time.

* * *

The new dress of the American Poultry World is very becoming and Artist Arthur O Schilling is doing splendid work for it, in and outside.

* * *

We still have room for more subscription agents. If you intend to visit some of the Fairs and Winter Shows, write us particulars and we will send you our most liberal terms We want an agent at every show to be held. Write to-day.

* * *

Consider our "Illustrated Ads.' They suggest a dandy and cheap way for you to advertise; they have class and will surely attract attention.

* * *

The Canadian Poultry Review, always a good, sound and substantial poultry journal seems to be improving with every issue. The July issue has several timely and practical articles. Canada has many able breeders and writers and a world of fine poultry.

Owen Farms Birds Will Win the Opening Battles of 1915-16 In the Hands of My Customers

Last Year My Birds Made Crashing Victories at New York State Fair and At Allentown

26 Out of a Possible 44 First Prizes at the Two Best Fall Fairs in All America, Was My 1914 Record

1915 Show Birds Now Ready

My youngsters are better than ever before. I will not exhibit this Fall and will sell you a Cockerel, Pullet or Young Pen to win your Fair and will spare birds I could not let go were I exhibiting myself.

I have Cocks, Hens and Old Pens in each variety that will be ready and will win for you.

You will win if you buy my birds. If your competitor shows my birds he will do the winning. Think it over and write me all particulars. My quotation will go by return mail.

675 OWEN FARMS BIRDS have been placed among the **WINNERS AT MADISON SQUARE GARDEN, NEW YORK,** and 370 of these birds have **WON FIRST PRIZES** so far as competition from other breeders is concerned. No similar record has been made by the birds of any other breeder in all the world.

It means a lot to you to buy your birds from the man who breeds and raises his winners and has line bred them year after year with **constantly increasing average quality.** My birds will not WIN FOR YOU but have the inherit merit to BREED YOU WINNERS, and very bird I sell you will have been bred by Owen Farms. If you are in dead earnest in your desire to win and to breed winning chicks your order will come to me.

Owen Farms' Buff and White Orpingtons, White Rocks, White Wyandottes, S. C. Rhode Island Reds and S. C. White Leghorns

are established flocks. They have been the foundation blood of thousands of successful breeders all over the world. They are today better than ever before, and consquently I AM SELLING BETTER BIRDS FOR GIVEN PRICES THAN AT ANY TIME IN THE HISTORY OF OWEN FARMS.

Owen Farms Prices have always been lower, quality considered, than those of other breeders having established strains that approached ours in quality. With the greatly improved average quality in my flocks this year even better values will be given. Every one of you owes it to himself to make his money buy for him the **highest individual quality and the highest producing quality. You will find the combination here on Owen Farms.**

——WINTER SHOWS——

You are watching your young birds come on and your old birds moult with the keenest interest. You are liable to feel a little weak in one or more clasess for your strong Winter Show. Why not have the all powerful backing of Owen Farms and know your competitor cannot purchase here because you have already booked your order. **I will not sell more than one customer for any one class in any show.** This is a very strong reason for placing your order early and thus prevent your competitor from buying of me. Have already booked orders for a number of shows. It is none too early for you to get in line.

——UTILITY QUALITIES——

Owen Farms Birds are famous the country over for size, bone, perfect health, vigor, prepotency and heavy laying qualities. There are no birds that excel them in these important functions and very few flocks anywhere near as good.

My Birds Live, Grow, Lay and Pay

HUSKY UTILITY COCKERELS, $3.00, $4.00 and $5.00. PULLETS, $2.50 and $3.00.

BREEDING BIRDS

You are now planning your matings for the coming season. Why not place your order. **I will not sell more than one customer for any one class in any show.** and can make a splendid selection of a bird or birds to meet your exact requirements. A 25 per cent. deposit will hold your birds for you and delivery will be made when you need them. An early order will work to your advantage and to mine.

Satisfaction Guaranteed Every Customer Every Time

and this guarantee is backed by my 26 years' experience in selling thoroughbred poultry.

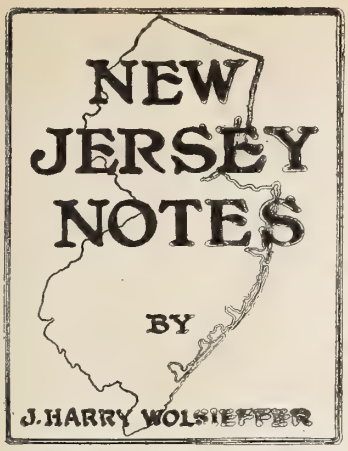
Everybodys Poultry Magazine Publishing Co.

HANOVER, PA.



ALL ROADS lead to the Field Days at New Brunswick, Thursday, Friday and Saturday, September 9th, 10th and 11th. Mr. C. D. Cleveland, chairman of the educational committee has a fine program scheduled, that no one interested in poultry should miss. All that the Field Days need to make it a success is a good brand of weather.

* * *

Progress with the plans of the Vineland Egg Laying contest to be staged in 1916 is satisfactory and indications now point to a contest that will surpass anything in this line yet held in this country. With ideal climate, location, as good as any, and up to date management some good records should result.

* * *

The so-called slump in business has in a measure been of much benefit to the average poultry keeper, in the closer culling of the flock, giving them more room, and retaining only the best, the result being as much profit with fewer fowls. In this age of big things the average poultry keeper to fill the poultry house has retained many fowls that should have gone to the market. Quality and not quantity is what counts.

* * *

The Pitman, N. Y., show, August 11-12-13th, had surprisingly good quality for a summer show. For the past three years under the management of Mr. Nichols, this little show has both increased its quality as well as entries, and bids fair to become a fixture in the South Jersey section.

* * *

The new standard of perfection is out in spite of some mistakes, on the whole, it is the best standard yet put before the poultry keeper. At any rate for the next few years it must be the breeders guide and the Judges law.

* * *

For the one man poultry farm, fruit trees make an ideal combination. They provide shade which is so essential to the welfare of the fowls during the summer months and at the same time added profit to the poultry farm by the sale of the fruit. There is nothing better than natural shade with its good circulation in the poultry runs.

* * *

With the quick get-rich systems, and takes of great profits, such as $6.41 per hen commercially, becoming each year less before the poultry public, and the better advice to the beginner, as to the truth about poultry operations, the industry is coming back to a safe and sane basis, and in the future with a better understanding about poultry matters, greater success is assured.

* * *

Poultry Associations should be allowed the use of the state armories for their poultry exhibits. These armories lie idle a greater part of the year and the educational features of a good poultry show would in no way affect the standing of efficiency of the companies during the week of the show. Poultry shows are not money making affairs, seldom does any association do more than break even and a great number lose money. A nominal charge could be made to cover the expeness of lighting, janitor, etc., such as is done in Baltimore, which has enabled this Maryland Poultry association to pull off a classy show each year in a beautiful armory.

In many cities of New Jersey the local association could schedule good shows if they were enabled to get a suitable hall and in these cities stand Armories, practically idle, which the Associations cannot obtain use of—(even for money). There should and may be a State Law in the future covering agriculture and educational exhibits to be allowed for a sum covering expenses of the armory for a week to use these armories which are paid for by the people.

* * *

Reports coming from this zone and even distant parts of the country bear out the statement made in the columns some time ago that less poultry was hatched and reared this year than in former years.

Quality, however, is of a better grade. A natural out-come where in a majority of cases, better care is given to the growing stock with more house room and closer culling. In the majority of cases the poultry keeper will make more money, having a feed bill that is less than formerly and better production from the quality flock. The average poultry keepers unit has been too large and the trend now among practical poultry keepers is a reduced number to the flock. This applies to brooding also.

* * *

There has never yet been a time when poultry, properly managed, did not pay, good years or bad years, and while one can hear complaints this year about the high price of poultry feeds and the low price of eggs and poultry during the spring when eggs are always low, and now during the period when poultry is at low ebb, and eggs going up. One cannot change the seasons—but in face of the market prices the man with a flock of producers has made good, the other kind never did or will. They ever show a balance on the right side of the ledger. Fresh eggs will be just as high this fall and winter and perhaps higher than last year, fresh poultry will command a living price. Like the peach grower this season, in the face of low prices due to one of the heaviest-bearing years known, the orchardist with clean, big fruit will make good. While it is true the profits were not as great as in former years, the up-to-date fruit grower and the up-to-date poultry-keeper put a balance on the right side of the ledger, the other fellow did not. There is always a sale for the A-1 article.

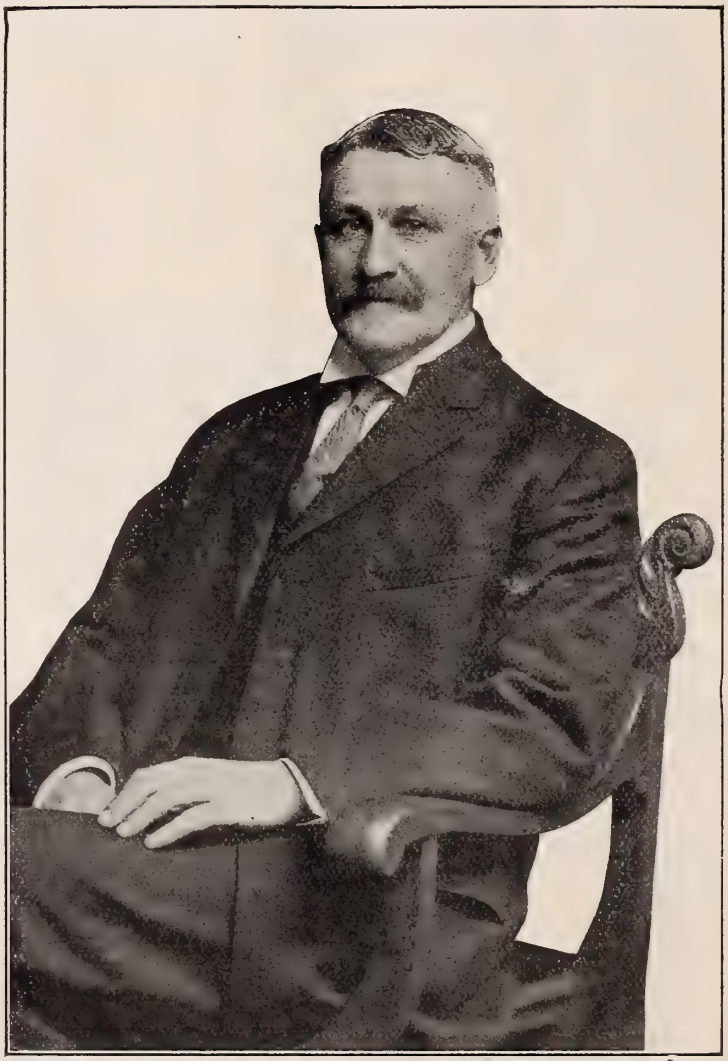
The Sunswick Poultry Farm

S. C. Buff Orpingtons and S. C. Buff Leghorns the Specialty Here—Quality of Sound Buff Color With Exquisite Shape the Feature of This Line—Prominent Winners for Years. A Practical and Successful Plant.—By H. P. Schwab.

THE breeding of fine poultry is a mere habit with some, a pleasure to others and a desire to many more. To Mr. Rufus Delafield the owner of the Sunswick farms, South Plainfield, N. J., it is all these combined and perhaps more, for his activity in breeding S. C. Buff Orpingtons and S. C. Buff Leghorns is second only to his general interest in all that pertains to poultry, its breeding, organization and its general welfare. Mr. Delafield is a fancier first and last who views poultry within a liberal and broad minded way that has added greatly to his worth as a breeder. He admires sound Buff color, it has a charm for him, but he also admires shape and with it practical worth, and it is his work along these lines that has given him his standing among breeders and has made his line so justly famous the country over.

The Sunswick Buff Orpingtons have for many years been prominent and consistent winners at both New York Shows, Boston, Philadelphia, Chicago, Baltimore, Allentown, Williamsport and other exhibits of note. Their quality is universally known. It is the quality that is found fitting to this line naturally for both shape and color, as they have it today is soundly bred into them. They are reliable and of high quality with reason, and we can expect more of them in the future.



Rufus Delafield, owner of "Sunswick" and one of America's best known breeders. His success has been obtained through his knowledge of breeding, as well as ability to please his customers.

Our visit to Sunswick on August 4th, was one of special promise, with promises made good. Mr. Delafield wrote us that he had the best in old and young he ever produced, so we went to see, now admitting that he did not tell us the half in his letter.

There we saw a larger and greater flock than ever in the past. More early birds and others of all sizes, shape, comb, eyes, etc. In size and full of health and vigor of the finest possible Buff color. Even and sound, progress in buff surely means progress in breeding, and this progress was evident here, while we admired their color, the clean, clear buff, free from shafting and shading, we also considered other points essential to highest quality, such as shape, with style, this line has special merit, heavy in bone, deep, full breasts, they stand clean and strong, all marvels in Standard form. Combs have been wonderfully improved. So have eyes, the improvements are so noticeable and so pleasing that we are free to admit both exceptional beauty and value to Buff of this quality.

They now have fully matured young in both cockerels and pullets to supply the wants of their customers. In old birds they are sold very close, still they still have a few cheap females to spare. Here we saw a hen hatched from their eggs sold to a breeder in the Southwest that made a record of 245 eggs in her "Hen Year." The owner sent her to Mr. Delafield with his compliments. She also has a rare color and exhibition quality.

For the past year or two S. C. Buff Leghorns have also been bred here. They now have a large flock of beauties of rare color and of extra fine size and shape. In form they equal the best S. C. Whites we have seen, standing up well, with nice, long full bodies and low carried tails. In these, like in S. C. Buff Orpingtons, they have a large and select flock to fill the requirements of all patrons.

The Sunswick farms are located at South Plainfield, N. J., within easy distance of New York City, in a fertile country. The buildings are modern, well kept and convenient. The cockerel house is one of the best and most practical we have seen. The breeding houses are all of the large Colony style. Each has three pens and a long yard to each. The growing yards are ideals with a good sod and filled with peach, plum and apple trees. It is a homey place with a welcome that is sincere. It is a "Fancier's" plant that we wish every reader could visit.

Mr. Delafield has been fortunate also in having qualified poultrymen. Men who know Orpingtons and Leghorns and have made a life study of Buff color. Mr. Hobbs, his superintendent, is one of the original Orpington men, who served with Mr. William Cook in England years ago when this breed was in its infancy. Mr. Wilson also is a chicken man from the top of his head down, and we were pleased to find him located here. With these two able men we advise all hands to keep their eyes on Sunswick. They have the quantity and quality and they will give every customer full value every time, of dependable stock or eggs.

Department of the Great West

BY ESTELLE E. COLLIER
Tacoma, Washington

THE time for the big fair, the greatest poultry exhibit the world ever saw, is at hand. Everyone who is able in the United States or in fact in the world, should send their best in poultry and fowl life to be with this big gathering. There is to be our greatest audience. There will be the place where new fanciers will be born. To see this big show at San Francisco, to see the fancy on a par with all the exhibits of the world, only, drawing a greater crowd and bringing forth more comment, will make more new fanciers than any amount of talking.

There is to be one great booth where the poultry papers and magaizines will be displayed and where subscriptions may be paid. Here all the poultry press of the world will congregate and when the people who thought the poultry industry a small thing of little moment see how large a gathering it is and see the fowls whose existence calls forth this great amount of advertising and poultry literature, they will have born within them the desire to be one of these. To incite to new membership is one great mission of the poultry press and the poultry exhibit. If it is possible to be among them at this great gathering it is the duty of everyone to either be there or have representatives there in form of well groomed birds.

Boise, Idaho, Ceeur d'Alene, Billings, Montana, Missoula, Montana, the Western Montana Poultry Show, Bellingham, Wash., North Yakima, Wash., State Show, Olympia, Wash., all have their poultry shows in Janu the first part of the year, with Moscow Ihaho, the last week.

Boise, Idaho, with W. M. Coass, Judge, and L. L. Long Secretary, Jan. 10-16.

Ceour d'Alene, Idaho, with C. A. Greenfield, Judge, and A. O. Laabs, as secretary, Jan. 4 to 8.

The war in Europe is felt on the Coast. We are so near the line between here and British Columbia that every other man on this side and that is from the other side. Canadians live over here and like it best while they swear allegiance to the British Flag while Americans live on the Canadian side. Many poultry shows formerly held yearly have been called off because of the war, their big buildings put to use for soldier's headquarters. The Provincial Fair at New Westminister, always held yearly has been called off.

Many Judges will be found to oppose use af the score card. Judge Drevenstadt is among those who have declared war against it. This is not surprising because taking up the use of the score card in the show room entails a lot of extra work and the secretary employed must always be a person sure of his ability to figure and accurate in every detail. When the score card is used a great deal of hard feeling is caused by little mistakes that when rectified means the replacing of the ribbons. The exhibitor finding his card replaced by one of lower score is, of course, rather angry after an hour or two of boasting on the brilliant qualities of the bird he thought had won a high score but tho the mistake is usually one of careless figures the blame falls on the shoulders of the Judge. No Judge, after scoring the birds, and having placed the winners, forgets the face of the highest scoring birds and a mistake on the part of the secretary is easily discovered when the Judge finds the high score placed on the bird he gave a low score. Mistakes under score card judging have to be corrected regardless of the feelings of the exhibitors and it is up to the Judge and secretary to see that mistakes that cause hard feeling are not made. Good efficient secretaries are the keynote to successful score card judging. The country is flooded with Judges who can place awards by comparison but how many can you find who can pass the test under the severe grilling brought out by the score card where a Judge's mistakes are as plain as the nose on his fase, his stupidity, his efficiency, his good points and his bad marked down for the judgement of all exhibitors.

On Puget Sound where the weather is always temperate winter and summer poultry does well. We have our prairies that drain the rainfall where the poultry run at large the year round and the green food is always plentiful. We can plant our kale in mid-summer for winter and in early spring for the summer feed. Cabbage and kale seldom freeze. During the last eleven years I have seen it cold enough to freeze

YOUNG'S STRAIN SINGLE COMB WHITE LEGHORNS I Have No Other Breeds

Acknowledged throughout the world as being the Standard for all the Leghorns and leading strain of heavy layers. They have been bred in line since 1853 for heavy egg production alone, and the show birds have simply been chosen from the layers. They are the only original line bred strain of Leghorns in America. Why not come to headquarters and get the best?

Hundreds of yearling hens and cock birds for sale. Eggs at half price remainder of season Mating list free Address,

D. W. YOUNG MONROE, N. Y.

the cabbage growing in the garden only once. Usually it keeps on growing all the year round. The late kale is best as it doesn't go to seed. If plenty of kale were always fed the hens during the winter the egg yield would equal the yield in spring. No green food has the fullness and richness of kale for poultry and cabbage and kale give them a great quantity of water which has every thing to do with the health of the fowls when under the steady strain of egg production. The grain fed will digest much better when mixed with kale.

Eggs average 31 5-6 cents per dozen for the last 12 months in the Tacoma market. There are a good many big poultry breeders in the vicinity of Tacoma with up to date ranches that make good incomes for their owners.

One can have a splendid choice when looking for a place to start a poultry ranch around Tacoma. We have a clay soil, shady and cleared, where the ground slopes in every direction with low swales and high dry places. We have our prairies without shade and our prairies densely shaded with trees three and four feet in diameter where one can build a log house as one clears the land, building a house complete in a few weeks with one man and a horse to help. We have our prairies without a single tree, where the ground is drained of its rainfall (and the rain falls every few days from fall until spring) in a few minutes after the rain has stopped.

There is one beautiful feature of this rainy climate during what we call our dark month. When the mist-like rain and drizzle does stop it is delightfully warm and clear with the mountains bursting into view and the fir trees glistening in the sun as green as the colors of spring. One can always work out of doors without gloves and poultry thrives on this coast of ours. The rain seldom falls heavily and where the fir trees abound the ground is dry the year round.

Tacoma's largest newspaper has a column every Monday morning devoted to poultry dope, edited by Harry H. Collier, holds "open house" every Friday in the Ledger building where he answers all queries concerning poultry and people come there to discuss the latest in poultry lore, and find out about the different poultry papers and organizations.

The California branch of the American Poultry Association is calling on its members for a fund with which to entertain the members of the American Poultry Association when they visit the Fair. This would be a fine thing as it would enable all the members to have meetings that would further the interest and the sociability of the members. People so far away from home would find many things of common interest with those of kindred tastes living in the West, knowing the conditions there and able to satisfy any curiosity concerning the possibility of poultry.

Trail B. C. will hold their annual show beginning the week of December 6. Grand Forks expects to follow with a show the next week.

The State Fair at North Yakima is always a good one. There all the old breeders of the Coast meet and stay the entire week renewing their friend ship of years' standing and planning another year's campaign. It comes at a time of the year when the hardest work of the year is over and a resting spell is had before the rainy season sets in for the winter. It never rains at North Yakima during the fair week and is always delightfully cool.

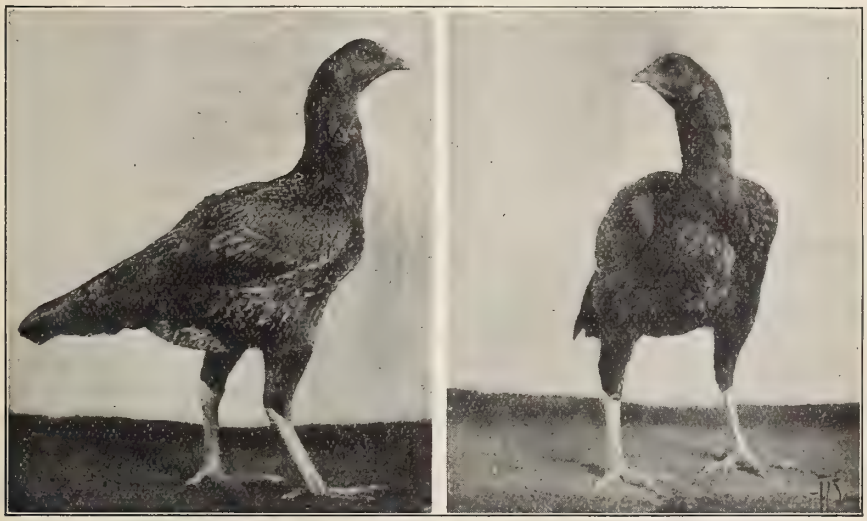
The Dark Cornish Fowl

A Visit to the Home of John W. Ward, Jr., Pennington, N. J.—Both Old and Young Stock Seen in Goodly Numbers—A Successful Plant.—By H. P. Schwab.

THE Dark Cornish, always an excellent fowl, owe their popularity and position, along with much of their present quality, to Mr. John W. Ward, Jr., Pennington, N. J. For the many years we have known him he has always been active and foremost in their breeding. His work as a breeder, as an organizer and his active part as club secretary for many years, has stimulated interest and has made this deservedly variety one of the leaders of this day in Standard-bred poultry.



The Dark Cornish appeals strongly to those who wish a practical fowl of extra table qualities. Their natural strength and vigor with excellence of flesh commend them highly. The above pullet is on that was sent to Mr. F. L. Swell by Mr. John W. Ward, Jr. Next month we will show the dressed carcass.—H P. S.

We have seen this line at their home before, also at the great shows for years where they have made many grand records, but we never viewed them with more pleasure than on August 3rd, 1915, for here we saw his old and young in improved condition and improved value. The young had a special charm for us, here were cockerels and pullets nearly finished, at their best, hearty and strong with grandest station, standing bold and strong and of highest color and markings.

Since they left their brood coops they have been roaming at will with an untampered freedom over the whole farm, in the hedges and through corn fields. Their condition is wonderful. Their ruggedness beams all over them while they are finishing in Nature's way. He values strength and vitality above all and in his entire flock we did not see a frail or droopy chick.

While many of the old birds were in moult we could see enough of them to note the "Ward Quality" in all. Several of the hens and three cocks looked particularly prime and fit to us. Here also evident strength and grand shape with size were features, sound valuable stock of this kind is sure to give results. In both old and young his stock is ample to supply the wants of others.

Mr. Ward's successful work with the Cornish will ever live as a credit to him, his every interest is backed by his confidence in the worth and value of this breed for whose popularity he is greatly responsible. His Club and Association work has brought results for the Club now has close to 400 members and is growing daily. We were more than pleased with the stock and all conditions seen here.

Mr. Wards many friends will be pleased to know that John Ward 3rd arrived a month ago now weighs over eleven pounds and is strong and hearty. We know for we heard him crow.

The Possibilities In Poultry Breeding

(Continued from Page 388)

By Ralph Woodward,
Grafton, Mass.:

Perhaps it's wise that we cannot look into the future and make a reasonably sure prophecy as to what is liable to happen. We live our lives in the present, having the past to remember and cherish and as a guide for future progress and fulfillment.

The poultryman goes about his work from day to day always with a hope for the future and happy in his past achievement and success; these with his failures—and few there are who have not met with some failures—are the guides and encouragement in his life work.

We look with increasing hope however, into the future of the poultry business, speaking in a general way yet conditions in North America have been fraught with several handicaps and outward conditions that have somewhat retarded the growth of the business for several months past.

The horrible European war has affected us adversely in many ways. The general stagnation of our manufacturing industries except in a few specialized lines with the consequent diminished field for the profitable employment of labor; the failure to move the cotton crop with its resultant financial depression in Southern states; the war taxes imposed and absence of many men in Canada who have been called to the front, has been a severe blow to our brothers on our northern borders and with hard times extending generally with curtailment of many family incomes to a great extent, the poultry industry has had its discouragements in the past ten months. Now the brighte side of the outlook seems to lie in our serious belief that the war cannot or will not last much longer. We look for its termination by next Autumn and then conditions will prevail that will open wonderful fields for our products both in manufacturing and agriculture; and incidentally and as a result of good general business again, the poultryman will profit, along with all others who are producers.

The most encouraging aspect of the poultry business at present as we look over the situation is in a gradual movement of our city population out to the country, or at least to get away from the crowded condition of the city to some place where they can have a bit of land about their home.

The movement of "back to the soil" as exploited and signifying that every man is to leave the city and take up farming as an occupation does not appeal to us, or is it what we have in mind in these few remarks.

Any man of middle age employed in manufacturing or a commercial pursuit—had better think twice before he gives up his business or work and suddenly goes out and takes up general farming or even poultry culture on a scale large enough to afford him a livelihood.

The change of environment is too abrupt, the lack of knowledge of conditions in the country and his inexperience in the new occupation are more sure to bring failure than they are to bring success.

What we do see in their gradual exodus to the suburbs is all to the good. The man keeps his city position and there is assured of a competence, but he has his little place and can do outdoor work about his house morning and nights. He has his garden spot and seldom fails to keep a "few hens." He has a good healthy place to bring up his family, pleasant social interests and congenial occupation out of doors for his spare hours.

From the viewpoint of the poultryman who depends upon the sale of Standard bred poultry for his income this rapidly increasing suburban population offers the best and one of the most important outlets for his products.

Few who go out to live in the suburbs fail to keep chickens and they will not long be content with just hens, i. e., mongrels and crossbreeds.

These people are reading the poultry papers and attending poultry shows. They are learning that Standard-bred poultry—uniform in size, shape and color are the only kind of poultry that will satisfy them. They have a sense of the artistic and a love of beauty in nature else they would have stayed in the city.

It is our firm belief that we will look more and more to this country population and small farmers for our sale of Standard-bred poultry, stock and eggs; and with good and better times surely coming again, we have no fear of the ultimate success and advancement of the poultry industry.

"EVERYBODYS"
PRIZE SUBSCRIPTION
Contest Extended To
December 10th, 1915

We have found it advisable to continue our Prize Subscription Contest until December 10, 1915. the date formerly set for closing proving unpopular as it really barred a great many who wished to enter this contest.

We now hope that this extended time will meet with the approval of all, and that it will tempt many more to enter and to secure subscriptions for "Everybodys."

GET BUSY NOW

the opportunity is equal to all. Write us today for sample copies, contest blanks and for any information desired.

The White Faverolle

By K. M. TURNER, West Nyack, N. Y.

THE metamorphosis of the primitive barnyard hen to the majestic, deliciously tender and juicy table bird is perhaps most complete in the now war-torn section of France known as Faverolle, where no special attention was given to anything but the producing, by a series of matings, covering many years, of fowls which in themselves presented each its own peculiar advantages.

The result is now shown in the White Faverolles which, within the past very few years have made such wonderful progress among those who believe that a perfect utility bird should be an egg producer, as well as an ideal table bird. The White Faverolle has demonstrated beyond a doubt her ability to provide for those for whom she works with both meat and eggs. In the year 1913 the village from which she derives her name shipped more than 600,000 dressed Faverolles to the Paris and Houdan markets. Large of body, long in keel, she weighs as a pullet six and as a hen seven pounds, which would give us a minimum of more than 3,600,000 pounds of tender, delicious meat from that one section.

The White Faverolles—Artistic, Beautiful and Practical. Bred by the Dielograph Farm, Mr. K. M. Turner, Owner, West Nyack, N. Y.

Is this not sufficient to attract the attention of those who are interested in reducing the high cost of living and place a premium on the preparation of fowls for the table?

After leaving the egg the Faverolle grows rapidly and soon develops the ability to hustle for himself. This spring I kept a careful record of their growth:

At 5 weeks old a White Faverolle weighed . . . . . 1 lb.

At 9 weeks old a White Faverolle weighed . . . . . 2 lbs. 12 oz

At 14 weeks old a White Faverolle weighed . . . . . 3 lbs. 8 oz

At 18 weeks old a White Faverolle weighed . . . . . 6 lbs. 10 oz

At the present market price for live weight birds shipped to the commission men in New York city, this bird at 18 weeks old would bring $1.30. The mother of this particular bird laid last season 187 eggs. This is what I call an all round utility bird. Any breed that will sell in the open market for $1.30 each at 18 weeks old or lay 187 eggs in one twelvemonth, is a breed that should attract not only the attention of the breeder of fancy stock, but of the farmer and the suburbanite, or in fact anyone who has a few spare feet of ground.

Economic conditions change our life, habits, and even our personality. These changes come over us and it is not until the third or fourth generation that comparison with former conditions proves to us beyond the question of a doubt that "the world do move," and that we have unconsciously moved with it.

Generations ago when the range supplied meat for the tables of the nobility of Europe, no thought was given to the raising of poultry as a food product. The fields, the forests, and the woodlands supplied the meat, and the kingly feasts served in baronial castles was evidence of the bountiful supply. This was especially true in France.

Time passed, the population decreased, monarchical rule gave way to republic, which in turn was overuntil the war, which those living still thrown for the rule of the despot, remember, when the people again came into their own. Prosperous, Prosperous, mulitplying and thriving, the matter of meat became of more than passing importance, and the barnyard fowl was their natural source of supply. Always thrifty, recognizing its value as an adjunct to the maintenance of the household table, their attention was not only turned to the purpose of the bird, but to breeding it with a view of securing the maximum quantity of meat and eggs with a minimum amount of waste—carcass.

This event, heralded with no pomp or display, was of greater importance to the nation than the acquisition of thousands of square miles of territory won with the sword and the blare of trumpets.

HANOVER FAIR AND POULTRY SHOW, SEPT. 14, 15, 16 AND 17

Entries close for the Hanover Fair Poultry Show, September 7th. Write Chas. S. Shirk, Supt. Poultry Dept., addressing him at Hanover, Pa., and receive by return mail a premium list which will give you all information pertaining to this old established Fall Poultry Exhibition, where year after year, the products of many of our best breeders and fanciers are placed on exhibition. The Hanover Fair Poultry building is one of the best arranged in the country, with modern equipments throughout, and where every convenience is afforded the exhibitors. Messrs. J. Harry Wolsieffer, Louis Paul Graham and Geo. L. Young are the judges. Show dates Sept. 14, 15, 16 and 17.

Cheap Poultry Stock Never Pays In End

Amateur Breeder Generally Gets Poor Results When He Goes Bargain Hunting—Start With Best Fowls—Right Strains, Eggs and Chicks Yield Best Profits in Every Way.—By J. Harry Wolsieffer.

THE season is now on for the purchase of stock. A little later the demand will be for hatching eggs and day-old chicks. Each year a certain per cent. (mostly beginners) are dissatisfied with the stock, eggs or chicks purchased. In the majority of cases this is largely due to lack of knowledge of the value they should receive in return for the money sent to the different breeders of stock, eggs or chicks. It is true that the day has passed of the $10,000 bird, or other high values, and the poultry public is coming down to a safe and sane basis. In some cases the reaction from the high prices paid is toward the other extreme, and has caused the bargain-counter to become operative, to the detriment of the beginner's future success. In this case the extremely low price has appealed to the prospective customer, and the order has been forwarded for low-priced birds, stock or eggs, and, naturally getting what he paid for (and in the majority of cases expecting the same grade as the higher priced eggs, fowls or chicks), he is disappointed.

In the past stock and eggs have in some cases sold above their real value taking the strain either for laying or show purposes, and again the price has been too low for the grade of goods sent out by the breeder. In this case the purchaser was on the long end, and received more for the money than he should. This is due as a rule to the breeder's inexperience in judging the true value of his cock, or perhaps being overcrowded make a sacrifice sale to enable him to have more room. As a rule the breeder of years of experience knows the value of his flock, what they will produce, either from a show standpoint or utility, and in many cases both and the better his strain is in one or all lines the more money he should receive, for the purchaser receives more than from a strain of haphazard breeding.

For years practical writers have advocated avoiding cheap stock. They well know, through their own experience, that hatching eggs, day-old chicks or stock cannot be sold at any kind of profit for but a few cents above the market prices. Any poultry raiser is better off selling the males for broilers or roasters, the culled pullets and fresh eggs at the best market prices, with no expense to him in advertising, shipping coops, extra buildings for males, the extra trouble of handling breeders, the care of handling the hatching eggs of the worry of incubating day-old chicks, than to be compelled to cater to the trade that is in many cases so hard to satisfy.

The above magnificent specimen of the Cornish Fowl belongs to Mr. T. H. Hetherington, Monongahela, Pa. This two-year-old cock weighs 10 1-2 lbs., and both as cockerel and cock has made a proud record at the Club Shows.

The beginner should remember that cockerels kept until they show the shape of the breed, are fair in color without disqualification, cannot be purchased for less than $5 up. Then do not expect a show bird, or a bird bred from a 200 or more egg record hen. Pullets, according to their age, can be purchased for $1.25 up. The earlier the hatch of the females the higher the price, and these $1.25 pullets should not be expected to be from trap-nested heavy layers, but should be from good, strong, standard-bred hens, or should any purchaser expect anything like show specimens the price on both cockerels and pullets depends largely on the breeder's skill and reputation his strain has obtained either in the show room or egg basket. As in every walk of life, there are breeds of many grades of many grades, some good, some fair and some bad. The better the breeder, the better the results the purchaser will obtain from the goods sent him, so $15 is not too much to pay for a cockerel to head the pen for future breeding operations; $5 up is a fair price to pay for females to mate to this male; from $3 to $8 is a fair price to pay for high-grade hatching eggs from selected matings, and if successful in the growing of a fair percentage of the chicks specimens of many times the value of the eggs have resulted. Day old chicks of any kind of quality can be purchased from $15 to $25 the hundred.

Where the beginner makes his first mistake is in the purchase of bargain counter stock, the cheapest he can find, and naturally on looking at his neighbor's flock, purchased from some good breeder he is disappointed in his own birds, not only appearance, but in the results obtained from them. He was not cheated. He only received what he paid for, and in the end cheats himself for, sooner or later, if he sticks to poultry—and they are the kind that win success, the stickers—he will purchase good stock eggs or chicks, will reap the benefit by having uniform fowls of fair color, breeding true each year and producers of eggs and plenty of them, if properly cared for. It pays to purchase the best in the long run.

Everybodys Poultry Magazine Extraordinary Prize Subscription Contest

FREE! Your Choice of Any One of the Best Poultry Books Published

In this the Greatest Free Offer made, we give you absolutely FREE any one of the books listed below. They are standard works, reliable, practical and helpful. Edited and compiled by the most brilliant writers and artists of the day. To accomplish our purpose to get one of these books in the hands of every fancier, we will mail one copy (your choice) free for the first six subscriptions to **Everybodys Poultry Magazine** you send us at one half our regular subscription price.

Send us six subscriptions to **Everybodys**, with $1.50, and we will send you post-paid the copy you wish. Make your own selection.

ALL THE MUSIC OF ALL THE WORLD CAN BE HAD WITH THE COLUMBIA GRAFONOLA "THE BABY OF THE HOME CAN PLAY IT."

1ST PRIZE—COLUMBIA GRAFONOLA "DE LUXE" **$200**

This instrument represents the apex of achievement in cabinet struments. There is none better made. It is of the highest and finest grade (See illustration). It is 19 3-4 nches high, 22 1-2 inches wide and 24 inches deep.

2ND PRIZE—COLUMBIA GRAFONOLA "MIGNONETTE" **$100**

Its appearance is dignified and artistic and is of the same high quality as the larger size above. It is 44 3-4 inches high, 22 1-2 inches deep and 19 inches wide. See illustration.

3RD PRIZE—COLUMBIA GRAFONOLA "FAVORITE" **$50.00**

A popular "Favorite" with all lovers of music. This, like the above instruments, is fully equipped and can be had in Mahogany or Quartered Oak in Golden, Fumed or Early English finishes. See illustration.

FOURTH PRIZE—$25.00 TRIO OF FOWLS, INCUBATOR, OR BROODER, YOUR CHOICE.

Fifth Prize—$25.00 Trio of Fowls, Incubator or Brooder, Your Choice.

Sixth Prize—$15.00 Pair of Fowls, Incubator or Brooder, Your Choice.

Seventh Prize—$15.00 Pair of Fowls, Incubator or Brooder, Your Choice

Eighth Prize—$10.00 Pair of Fowls, Incubator or Brooder, Your Choice.

Ninth Prize—$10.00 Pair of Fowls, Incubator or Brooder, Your Choice.

Tenth Prize—$10.00 Pair of Fowls, Incubator or Brooder, Your Choice.

In making your selection of Fowls, Incubators or Brooders, they must be selected from advertisers in Everybodys

We will furnish you with subscription sheets, also with sample copies for use. Remember our regular subscription price is 50 cents the year, but to subscription agents in this contest, it is but 25 cents, so you are at liberty to take subscriptions at the price you think best, some agents give all their commission to the subscriber and in this way probably get more subscriptions. We leave this for you to arrange according to your condition.

SPECIAL INSTRUCTIONS TO AGENTS

1st. Renewals count the same as new subscriptions. 2nd. Cash must accompany all subscriptions this will avoid misunderstanding. 3rd. Keep a duplicate list of all subscribers sent us, in case any question arises when the contest closes. **4th In case of a tie the value of the prize will be divided. 5th This subscription contest closes** December 10, 1915. All letters postmarked that day will be counted, thus giving those at a distance an equal chance with those near. 6. A list of all winners will be given in the January, 1916, issue. 7. All agents may work where they please; this is fair to all. Send for more supplies at any time. 8. No subscriptions can be sold for less than 25 cents. You must send at least six subscriptions to entitle you to agent's commission on prizes. 9 All subscriptions must be taken on the merits of the publication. 11. **Notice**—Take three years subscription to "Everybodys" for $1.00 to any one party. Send 75 cents and keep 25 cents as your commission; this will count as four subscriptions on the contest.

TODAY IS THE TIME TO START

"Get Busy." Start today and be one of the first. There is advantage in this. Subscriptions for **"Everybodys"** are easy to get.

DO NOT NOW DELAY TO ENTER THIS CONTEST

Remember, you are to send us only 25 cents for each subscription. You keep the balance for your commission. This opportunity is yours to accept. You receive your choice of the Poultry Books offered for the first six subscriptions you send us. Send for sample copis and subscription blanks today, they will be supplied at once, free of charge. Start today as you will be getting in on the ground floor.

Everybodys Poultry Magazine Publishing Co.

HANOVER, PA.

Cruelties In the Poultry Yard.

By Michael K. Boyer, Hammonton, N. J.

IT is surprising how many people otherwise model citizens, are guilty of cruelty to both fowls and animals. It may not altogether be intentional on their part, but nevertheless they do things that call for censure.

One of the most common acts is to carry chickens by their legs, heads down. This cruelty has been practiced for years, and no one ever thought anything about it. They did not notice the rush of blood to the head of the fowl when carried that way. A neighbor just the other day was carrying a fat hen by the legs, and in a few minutes the bird was gasping and came pretty near choking to death. An equally cruel method is to carry fowls by the wings—especially so when the fowls are heavy bodied. The proper way is to allow the fowl to rest on the arm, and the legs held firmly by the hand; or it can be held between the arm and body.

A dealer was one day noticed to yank killing stock out of a crate, by catching a leg or a wing, and otherwise roughly handling them. When remonstrated with he replied that it did not matter, as the birds would soon be killed.

With some people it is common to throw fowls over the fence into a yard. There is no telling in what manner they will reach the ground, and when this cruelty is performed while the attendant is in a fit of anger, there is considerable force put into the throw.

A very pious old gentleman was vexed to the cussing point because his chickens happened to get out of the yard, through a broken fence, into his garden. In his anger he threw a stone and lamed one of the fowls. "There, it serves you right; I don't pity you a bit," was the only comment on the accident. How much better it would been to have carefully driven those fowls back into the yard and at once repaired the fence.

Verily, the contrariness of the hen is "not in it" with the contrariness and stupidity of some of the attendants.

A common cruelty is to overcrowd the flocks, especially in close, badly ventilated houses. Allowing the supply of drinking water to run out, and placing the drinking vessels out in the sun, are cruelties practiced by shiftless, lazy people.

Many acts of cruelty could be named in the methods employed in breaking up broodiness in hens. For instance, dousing them in water, tieing them by one leg to a stake, or throwing them into a yard of young cockerels to be knocked about right and left, are all practices that should be stopped. Broodiness is a provision of nature for rest, and certainly the industrious hen deserves it. But if it is wanted to have her change her ideas or conditions, the only humane way is to place all such in a separate house where there are no nests nor male birds, and allow them to gradually have the fever pass off.

For some years back it was the custom to sell little (newly hatched) chicks at the poultry shows, and also at large bird stores around Easter. These innocents were bought by fond parents for their little tots, and carried to their houses in pasteboard boxes. Without the proper brooder heat, or the right kind of food, these little chicks would be slowly tormented to death, quite often, too, by rough handling from the "cute baby." But it is not so now. The Society for the Prevention of Cruelty to Animals has taken hold of the matter and will no longer allow this uncivilized cruelty.

Anything that will inflict needless pain, or make the fowls uncomfortable, should be punishable. It is surprising how many people, who otherwise are kindhearted and good, will not stop to think that their very acts are uncharitable and un-Christianlike.

* * *

Fresh air, sunshine and exercise are the best poultry tonics. But fresh air does not mean drafts in the houses, nor does sunshine call for exposure to hot suns during the summer. Our houses should be so constructed that fresh air can constantly be present to drive out bad odors and purify the atmosphere. The sunshine should be able to reach every corner to destroy any germs that might be lurking in the dampness. The fowls should exercise by scratching that they may cause a good circulation of the blood. The above are the three best medicines in the poultry doctor's art.

* * *

Hardy parents beget hardy offspring If we neglect in this particular each succeeding generation will be more delicate. No fowl should be used in the breeding pen that has had a case of serious illness. No matter how sure we may feel that full health has been restored, there is still some taint of disease remaining in the fowl which will be inherited by the young. Inbreeding has caused more weakened constitutions than anything else we know of.

* * *

Some years back the poultry fraternity were greatly alarmed over the ravages of "cholera." If chickens died suddenly, of if they all of a sudden became sick, cholera was blamed for it. Of late years we hear very little about this disease, the reason for which is that we have very few, if any, cases of this dreaded disease in the poultry yard, and nine-tenths of those reported 20 or 30 years ago were not cholera, but instead a condition produced by a combination of indigestion and lice. The poultry were fed practically nothing but corn, producing an overfat condition, and the subject of grit was never thought of. Consequently the food being of overfat condition, indigestion was sure to present itself. This trouble coupled with lice—and in those days the poultry keepers were not so particular about keeping lice at bay—the fowls would succumb to cholera just about as sure as the "good old summer time" came round. It is a fact that genuine cholera cases are almost as scarce as hen's teeth.

* * *

Egg eating is a habit that starts with hens, generally, that are out of condition. In other words, when the hen gets too fat, and also when there is a scarcity of lime in the bill of fare the shells of the eggs become thin. When being laid these soft shelled eggs usually break and the hen thus acquires a taste. It is always best to gather the eggs several times a day, so there will be no chance for breaking by hens crowding on the nest, or by the newly-laid egg striking those already laid.

* * *

For canker in fowls the following remedy is recommended: Mix 12 drops carbolic acid, one teaspoonful laudanum, 10 cents worth sugar of lead, five cents worth sulphate of zinc, and one pint of water; shake well. Open up the nostrils with a broom straw, and with a small glass syrings inject into them the mixture, three times a day and put eight to ten drops in the mouth. Feed soft bran and give plenty of water.

* * *

Here is a novel way for preventing fence flying: Take good strong string, and tie a knot about three inches from the end; then take the end nearest the knot and put it around the top of one wing, and tie a slip knot below the knot in the string so it cannot pull up to tight on the wing. Then pass the other end of the string under the other

Avon, Mass., July 30, 1915.
Everybodys Poultry Magazine,
Hanover, Pa.
Gentlemen:
Enclosed find my subscription to Everybodys for one year. Everybodys would be hard to beat at any price.
Yours very truly,
JOHN DOREMUR.

wing, and have it just loose enough so that the chicken can keep its wings folded naturally, and tie same as other end. After it has been on about six weeks the string may be removed, and your chicken will stay in just as though it had never flown over a fence.

* * *

It is characteristic of the laying hen to be quick in her movements, and more or less of a nervous disposition. When a hen is lazy, and moves about in a careless, indifferent manner, she is pretty sure to be a poor layer.

* * *

An egg to belong to the strictly fresh egg class, should not be over three days old in summer weather, and a week old during winter. But in either case they must be kept in a cool temperature. Heat very quickly stales eggs. Crates of eggs allowed to remain in the hot sun for several hours will quickly change their condition.

* * *

Poorly dressed poultry goes begging in the market, while the supply of choice (fancy) stock is not sufficient to met the demand. In shipping to market, all dressed poultry should be assorted according to size and color, in order to secure best returns. Small, poor scraggy, birds, half dressed, bring prices in proportion.

*

A "large roaster" means a plump, soft chicken of four or five pounds weight. The broiler weight in March is one and one-quarter pounds each; in April, one and one-half pounds; in May, one and one-quarter lbs. to two pounds. Old cock birds have a special classification, and do not come under the head of "large roasting" fowls.

*

The hen turkeys sell first, and medium sized carcasses sell best in market. The market turkey should be shorter in legs and neck than is ordinarily the case, and very full in the breast. A compact body, meat and fat, rather than a large size and coarse structure.

President Elect E. E. Richards, of Cedar Rapids, Iowa, is justly elated over the fact that the Iowa Live Stock Commission have by resolution voted an appropriation of $1,500.00 for Poultry at the San Francisco Exposition.

* * *

There is no doubting the fact that Everybodys Poultry Magazine has met with universal favor by all poultry lovers.

* * *

The South is fast becoming recognized as one of our strong poultry centers, the interest in pure bred poultry being ever on the increase. During the month of May, fifty-four car loads of eggs were shipped from Morristown, Tenn., in addition to twenty cars of live and three cars of dressed poultry. Surely, this looks as if the poultrymen of Tennessee were able to produce the goods.

* * *

The American Poultry Association has always had a staunch worker in H. H. Collier, of Tacoma, Wash. His efforts have born fruit in many ways and are showing strongly in the aroused interest being taken in the San Francisco meeting.

* * *

The Nebraska College of Agriculture has at last established a poultry department, funds being forthcoming after a long wait by Nebraska poultrymen.

* * *

John S. Martin, of Port Dover, Canada, the world known breeder of the Regal White Wyandottes, has returned to his home after a most enjoyable visit to the San Francisco Exposition.

It was the writer's pleasure to enjoy a day with Mr. Martin last summer on his visit to points in Pennsylvania and we know the breeders of the coast found him a most enjoyable visitor. To come in contact with men of Mr. Martin's type adds pleasure to the "chicken game."

* * *

Patronize your County Fair and regardless of your competition, show some good ones. You not only help yourself, but assist the industry in general.

* * *

Mr. Hiram Demmy, superintendent of the Whatglen Farms, Lancaster, Pa., where some of the grandest S. C. Black Minorcas in the world have been produced, writes us under date of August 5th stating that the past season their demand for eggs exceeded previous years. In addition Mr. Demmy states that the young stock at the Whatglen farm show wonderful promise.

* * *

The Rancocas Poultry Farms, Brown's Mills, N. J., always alert to the advancement of the best interests of the poultry industry, have made arrangements whereby they will be able to accept students for actual demonstration work on their model farms. In this way many graduates from agricultural schools and those who have taken correspondence courses, will be able to finish their education by actual poultry work. This surely is advancement.

* * *

Mr. J. W. Parks, of Altoona, Pa., the well known bred-to-lay Barred Plymouth Rock breeder, has returned to his home after an interesting trip thru New England, New Jersey and Pennsylvania. Mr. Park made this trip as one of education, visiting all the large plants on the journey.

Do not allow your subscription to Everybodys to expire, but renew today. We will date your renewal from the date of expiration.

* * *

W. Thos Wittman, superintendent of the Allentown, Pa., Fair Poultry Show, announces that the poultry building has again been enlarged, making this the third time that this has been necessary during the past few years. We all recognize in Mr. Wittman a man qualified for the high position he holds among poultrymen, and the noble work he has done for the Allentown Poultry Exhibition.

* * *

Lone Oak Poultry Yards, Batavia, N. Y., E. B. Peck, Prop., write us that their young stock in the varieties which they breed, have developed wonderfully this season, also that thy have now March hatched pullets which have been laying for a month past. Mr. Peck breeds both White Wyandottes and S. C. Anconas, and has established his Genesee Strain through his knowledge of breeding and square treatment of his customers. Write him your wants in these varieties. His prices are right and the quality will more than please you.

* * *

Mr. Frank Cross, of Montague, Mass., manufacturer of the celebrated adjustable clinch leg bands, has again rebuilt his plant, after a severe fire early in March and is again turning out his celebrated make of poultry and pigeon bands.

* * *

Yes, the Standards are out, and your order, if placed with Everybodys, will have our immediate attention.

* * *

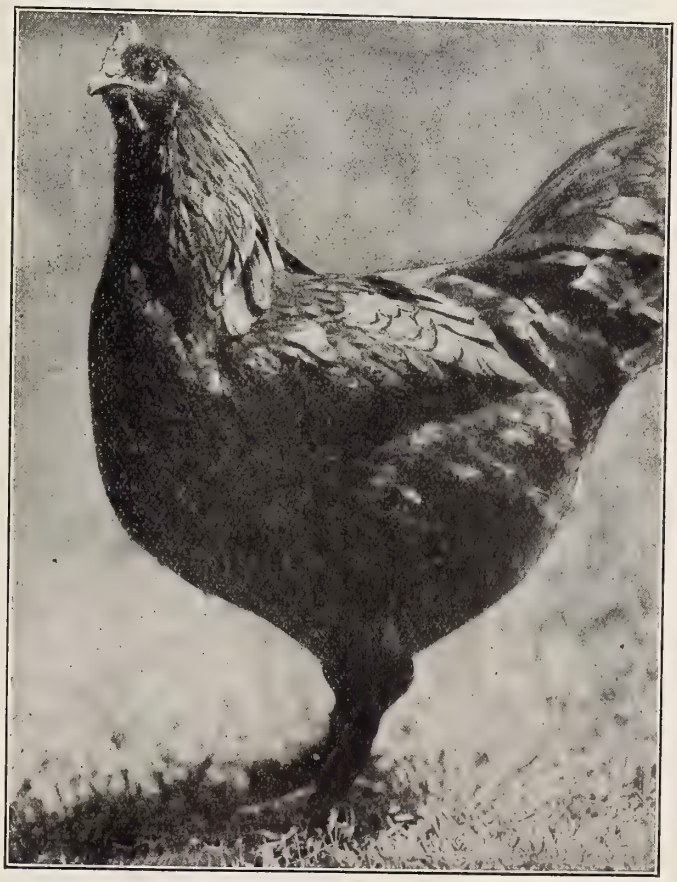
The New York State Branch of the A. P. A. will hold a meeting Wednesday at 2 P. M. of State Fair Week at Syracuse. All members are earnestly urged to be present and all persons interested in poultry are invited.

* * *

From every indication the Fall Fair Poultry Shows will, if anything, have increased entries over previous years. We base this assertion from the many letters we have received from the show superintendents and secretaries, in which they inform us that requests for Premium Lists are away beyond that of former years.

* * *

The badge of the submarine officer is a handful of cotton waste. The interior of the boat is everlastingly sweating oil. The doors and the walls and the steel seats exude their globules. It is even said that the dishes



Black Langshan Female. Another of Mr. Alexander N. Warner's (Titusville, Pa.) birds, of which he makes a specialty. Mr. Warner has been a regular at many important shows.

sweat oil, and before they eat, the members of the crew mechanically wipe the plates with a wad of waste.

* * *

An Association is now being formed whereby the South will have an Egg Laying Contest, this commencing about December 1st and lasting one year. Thousands have become interested in poultry keeping in the South during the past few years and a contest held right at their doors should be of great interest.

* * *

On July 19 Richard Chambers, of Millville, N. J., discovered that some one had kindly relieved him of the care of 125 chickens during the previous night. On the morning of July 23 he found the entire flock safely returned and an unsigned note tacked on the door stating that "Since the theft the writer had been unable to sleep, and had returned the fowls to relieve his conscience.

Mr. W. O. Jennings, the newly elected secretary of the Greater Buffalo Show, is well known to those who have exhibited at the Garden and Boston Shows and, in his new position as secretary of the Buffalo Exposition, will be pleased to renew his acquaintance with all old and new exhibitors. While we regret that Mr. Denny finds himself unable to fill the position of secretary, we congratulate the Buffalo management in securing so worthy a successor.

* * *

The general bill that was passed by the Nebraska Legislature gives the Nebraska State Poultry Association three thousand five hundred dollars, which will be paid yearly in two sums of $1,750 each. This was less than was appropriated at the last session of the legislature, but in view of the fact that the legislature was inclined this year to cut down all appropriations, they can be thankful.

* * *

The poultrymen of Southern Pennsylvania and Maryland are more than ever interested in the Poultry Shows held in connection with the Fairs of the Pen-Mar Circuit. Hanover, Pa., Sept. 14, 15, 16 and 17, will be one of the largest Fall Poultry Shows in the State. The combined interest occasioned by the Old Home Week Celebration will bring many fanciers from other states.

* * *

There is nothing more important in the prevention of disease than disinfection, and yet there is nothing in the poultry yard so neglected. Cleanliness should be enforced, but cleanliness without disinfection is not complete.

* * *

If more stress were laid by poultry writers on the success made in poultry keeping, rather than elaborating on the failures, it seems reasonable that more would be accomplished for the good of the industry.

* * *

True, it is well to point out certain failures, that others may profit thereby, but to continually have them pictured before one's eyes is harmful. It is usually the case that when one fails in the poultry business, they also would fail in any other business.

* * *

J. E Poole of Victoria, Tex., is the proud possessor of a hen's egg that his friends are very much inclined to believe is the largest on record. The circumference of the egg is 6 1-2 inches one way by 3 inches the other. It weighs a quarter of a pound and has been placed on exhibition.

* * *

Make Easy Money, Real Easy, by working for Everybodys in your spare time. Write us for particulars. What others are doing, you can do.

* * *

Henry Durling, of Spring Street, Newton, N. J., asserts he has the most wonderful barnyard fowl that the world has ever seen since the days of the hen Ayesha, that laid the golden eggs in Bagdad in the reign of the Caliph Haroun-al-Raschid. His bird lays eggs each morning with the initials of the family marked on each one.

A week ago Mr. Durling was painting his automobile and removed his initials from the side during the scraping process. Topsy, the famous hen, was strutting about and picked up the initials, "H. D.," and swallowed them. Mr. Durling did not know what had become of them until thre days ago, when he found an egg in the fowlhouse with "H" stamped on the shell. He waited further developments and was rewarded yesterday with another egg, with the letters "H D" inscribed on it, which he is showing to his friends.

DO NOT

Leap to the conclusion that "Everybodys" is the best advertising medium on the strength of what others say. Try it yourself.

THE CAPON

Ever taste capon? Try to imagine something finer than the sweetest,, juiciest and tenderest morsel of spring broiler you have ever eaten and that's—capon.

The origin of caponizing dates so far back that its beginning is lost in antiquity. The Chinese knew of it at least a score of centuries ago and it was extensively practised by the Greeks and Romans and in several of the Asiatic countries linked in history with these two famous empires. Today the empire of France knows capon, wants capon and gets capon, for the thrifty French small farmer and poultry raiser has sensed the great prodts in the industry and sees that the supply is never lacking.

The introduction of the capon to the American table is comparatively recent. The business of producing them in this country has advanced rapidly, rst taking hold strongly in and around the larger cities of the Atlantic seaboard, which have proved profitable markets. More recently, the Northern Central States have produced them in large numbers and at the present rate of growth, the industry should progress to an extent that might be termed country-wide within the next generation.

Type of Pullet Breeding Male used by Charles W. Orton, Greensboro, N. C.

The capon is a male bird from which the reproductive organs have been removed. In more familiar terms, what the gelding is to the stallion, the steer to the bull, the wether to the ram, the barrow to the boar, so the capon is to the ordinary barnyard rooster. When the alteration is made a complete change in characteristics takes place. The unsexed bird becomes docile and exceedingly sluggish, the comb ceases to grow, making the head seem out of proportion with the rest of the body, which takes on weight rapidly with no more than the ordinary amount of feed. The hackle and saddle feathers develop in wonderful fashion, making up for the loss of voice, since the crow disappears entirely. The true capon never courts trouble, being shunned, in fact, by the sex birds and usually left to seek the company of its own kind.

But, it is on the market that the capon gets the justice that is due and which has been denied in life. Not only does he outweigh his more fortunate brother, but he brings a much better price per pound. These prices vary, of course, with different markets, but the price frequently is double for the better pecimens, say a fourteen or fifteen pounder. To put the prime points of advantage of the capon tersely, he will eat as much as one cockerel, weigh as much as two and bring the price of four. Figure it out.

The birds to be operated upon should be from three to four months old, at which age the sex can be readily determined and the cockerel of sufficient growth to allow room for an easy operation. The chance of "slips" or death increases as the birds grow older and at five months the bird should either have been capoinized of left intact for breeding purposes.

Shut your birds up without food for about thirty-six hours. This is a most important factor in successful caponizing and no bird should be operated upon the intestines of which are not entirely empty. Next in importance is the light. Sunlight is the best that can ever be secured and the operation should be performed in the open air to take full advantage of it.

The Pilling "Easy-to-Use" caponizing instruments are recognized by all experts as standard. From the latest and best designs of men experienced in caponizing they are made by skilled mechanics in the factory of G. P. Pilling & Son Co., established over one hundred years ago at Philadelphia. They are primarily built for service rather than merely to sell and are safe, reliable and the high quality of Pilling instruments has become the standard with all poultrymen interested in caponizing.

VERY OFTEN

The poulterer is in a dilemma as to how best to advertise to advantage the choice breeding and show specimens he has to sell. To the unfamiliar, several of the many poultry publications look attractive.

But there is always a choice; there is urgent advisability of offering what you have for sale thru a Poultry Magazine which has the confidence of its readers.

Such a publication is Everybodys, with readers in every section of the country, readers who are fanciers, readers who are buyers, readers who rely on Everybodys as the medium to acquaint them with from whom to buy.

Write us for advertising rates and other information.

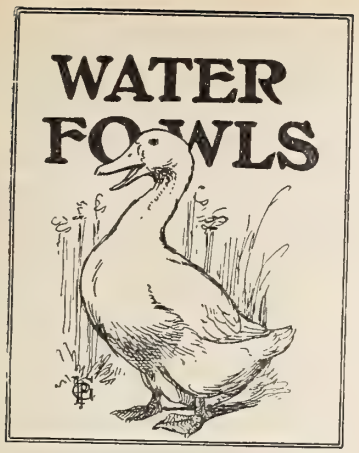
Originator Partridge Rock Fowl, Specialist, Just One Breed, The Best.



PENCILED RUNNERS

By Mrs. George W. Church

BY SEPTEMBER even the late hatched ducklings should be large enough to cull.

The amateur Runner breeder is often so charmed with his birds that he keeps the entire flock until after they have completed the second moult. This however, is a great mistake as nothing whatever is gained and considerable in the way of feed is lost.

Even the novice who never saw a duck should be able to distinguish the sexes when the ducklings are 8 or 9 weeks old as by this time if they have been well fed so that they have attained the proper growth, the ducks will "quack" loudly while the drakes will scarcely speak above a whisper.

Each one should be picked up separately and only the most perfect of the drakes saved.

Keep the ones having long, slender upright bodies, a good heavy bill, markings clean cut and not splashed with white where they should be solid fawn.

If the quills have not started sufficiently to show whether they will all be white it will be necessary to look them over again later and discard those having other than white in the primary and secondary flights.

With the second feathers an occasional drake may be slate, gray or wine color on the breast. These though admired by many, should never be kept. The colored portion of the plumage should be a good deep fawn which will not fade unduly.

On close inspection this seems to be finely peppered with two shades of fawn but a few feet distant has the appearance of solid color.

The cull drakes should be placed by themselves and fattened for market by the time they are ten to twelve weeks old or as soon as the first feathers are ripe. Just as soon as the new feathers start they begin to shrink in flesh consequently one should feed with a view to having them ready for market by the end of the twelfth week.

Few breeders sell any ducks on the market as they are too valuable as layers even though unfit for breeders. There is always someone who wants them just to lay market eggs.

In selecting the ducks for breeders, choose those having long bodies, upright carriage and as good markings as may be, also good strong bills.

Owing to the scarcity of Runners for a number of years, many breeders did not cull their flocks as they ought, but bred from good and poor alike in order to get large numbers with which to supply the tremendous demand.

As a consequence there are now many flocks only fit for market. These present a sad contrast to the flock of the careful breeder who has culled closely and mated properly for many generations.

The penciled runner is one of the easiest birds to prepare for the show room.

When fitting for the show we allow them mash only once daily as they must be kept slender. This is best done by feeding mostly whole grain.

Weigh them frequently so as to be sure they are neither too fat nor too lean.

When they have access to swimming water and plenty of clean dry bedding they will need no preparation other than proper feeding.

If they have no water for bathing then one must wash them unless they can be persuaded to bathe in a tub of water set in the pen. This, they will not always do in very cold weather then one must wash them carefully in warm water and rinse in two waters, the last being cold. Let them dry in a warm room on clean straw. In washing always stroke the feathers from the head towards the tail.

Mr. Maurice A. Delano, proprietor of Owen Farms, Vineyard Haven, Mass., writes us under date of August 16th that he has in his various varieties 8,000 young stock, and of good quality, far beyond his fondest expectations.

Hundreds of these birds are ready for your early fairs and sold under the Delano guarantee, the probable buyer will, of course, be interested to know that the past season has been so productive of results to the Owen Farms. When Mr. Delano makes a statement such as this, it at once carries interest, insomuch as it has weight among the buyers and backd from their personal knowledge of the "Delano Way."

As the Owen Farms will not exhibit this fall, their customers will thus be able to purchase these choice winners, and win at the shows where heretofore Owen Farms have shown and won the blues.

Get in quick touch with Mr. Delano, let him put his proposition up to you, giving you all the information you desire, freely and gladly.—J. T. H.

Amenia, N. Y., June 22, 1915
R. T. French Co.,
Rochester, N. Y.

Gentlemen:

Allow me to express my high appreciation of French's Poultry Mustard. I have been pleased to recommend this Mustard since 1912 and I am now more convinced than ever that it is a healthful tonic and that birds receiving it regularly are much better for its use. My Imperial "Ringlets" with their World's Records, appreciate it; they were never better in shape, color and size than now.

Very truly yours,
(Signed) E. B. THOMPSON.

Mr. Thompson is the originator and breeder of "Ringlet" Barred Plymouth Rocks, and surely, if his first trial three years ago had not proven a success for his world-famous "Ringlets" he would not be using it now. The fact that he continues to use and recommend the regular use of

French's Poultry Mustard

Cost: Not More Than 10 Cents Per Hen, Per Year

is evidence that he has found nothing that will do as much for his prize-winning birds. "It is superior to anything I have used for birds during the moulting season," writes Mr. Thompson in a previous letter . For your dealer's name we will send you an interesting booklet on "Mustard: Its Relation to Poultry and Increased Egg Production."

Why Campines Are Coming to the Front

By F. B. Wakefield

THE writer feels that no amount of praise from the breeders of Campines will be adequate to do this beautiful fowl the justice it deserves, and feels it will not be out of place for him to set forth a few of the reasons why he prefers the Silver Campines to all others.

Before deciding to enter the lists as a breeder of fancy fowls, I studied seduously the different breeds, looking up those breeders who were successful with their different breeds, and were willing to disseminate their knowledge gained from practical experience, also delving into the best publications on the subject, in fact I spent a whole year investigating, and finally landed on Silver Campines.

I feel that the time, patience, and work were well spent, for I am sure I picked the best and most pleasing type of fowl ever developed.

To know the Campine is to love them, they are different from any other fowl in many characteristics, they do things I never saw any other fowls do, from the day they are hatched they are more than interesting. I have heard persons say, I hate chickens, but I am sure if such a person would watch a brooder with say, two hundred little silvers two or three days old, for ten minutes, they would quickly change their minds, they are as funny as the proverbial "Box of monkeys" their precociousness is remarkable, and any one watching these little chicks, will then and there get the chicken fever.

No other breed of fowl I have investigated, develops as fast as Campines, and the ones I have raised seem to have no ugly age, almost before you know it they jump from the fuzzy stage to the full feather state, and are as trim and slick as doves.

For looks, in my estimation, no more beautiful bird among the domestic fowls exists, with their large dark eyes, handsome combs, beautiful white necks, and black and white barred bodies, with a carriage all their own, and as dainty as a Pheasant, which in a way they resemble, and an alertness combined with a quickness to learn what you want of them, makes them outclass other breeds. For those who want fowls for pleasure as well as profit, that are interesting and beautiful, this combination I have not had shown me in other breeds but it does exist with the Campine.

One of the most interesting things about a Campine is their tameness and friendliness, although very quick and active, they seem to love to be petted and handled, any of my fowls can be handled and picked up at any time or place and no one resists the desire to pet a Campine pullet when they are two or three months old. No daintier bird can be imagined, they are not a scrawny ungainly looking object, like the most of the ordinary breed of chickens are at that age.

Now for the utility side, I feel safe in making the statement, that a Silver Campine hen will cost forty per cent less to maintain, and will lay twice the value in egg product in the course of a year than any fowl belonging to the heavy breeds, for she lays in the late fall and winter when eggs are eggs, and when the other breeds mentioned are setting, the little Campine sticks to her job of laying large pure white eggs.

The Campine is not a slaughter house fowl, although on the table they are a delicacy, but are egg producers par-excellence.

A great advantage in favor of the Campine is the fact they can be kept in closer quarters than other breeds, this an inherent attribute, and they will do better on a small range than any other fowl.

To the city man or woman, who yearns to get in touch with nature, but has only the back of a city lot, the Campine will appeal strongly, a small flock will do well in the small space afforded, proper feeding and sanitation will make them pay a large part of the grocery bill.

To those who are ambitious to have a larger flock and wish to supply a fancy family trade with large white eggs, by all means choose the Silver Campine, for they lay eggs when eggs are eggs.

To those who admire a beautiful flock of chickens, and enjoy them for their beauty as well as their utility, then it is the Campine they want. and when buying eggs or stock for your beginning, get the best, the high priced eggs or stock is the cheapest in the end, when bought from reliable breeders.

WILL YOU DO THIS?
When writing advertisers, mention "Everybodys." Thanks.

FERRIS S. C. WHITE LEGHORNS

15 years' careful breeding for size, health, vigor, heavy egg production and exhibition. Trapnested layers. 60 first prizes at 15 big shows. Laying, breeding and exhibition stock shipped C. O. FERRIS LEGHORN FARM,
George R. Ferris
921 North Union Grand Rapids, Mich.

Myers' Barred Plymouth Rocks

"Lady Beautiful" Strain, Pullet Line Exclusively

My winnings, year after year, at the leading shows of America, where the Barred Plymouth Rock Classes are the strongest, show conclusively the quality of my line.

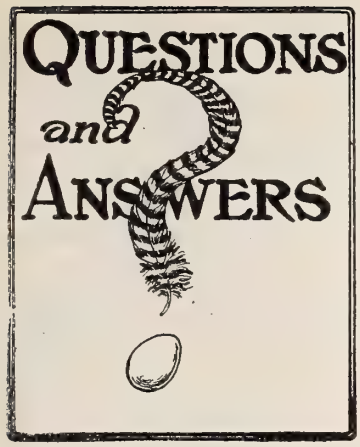
Winners of Five Championship Female Specials at Madison Square, Garden, N. Y., 1914; Philadelphia, 1913 - 1914, Hagerstown, 1914; Williamsport, 1914.

This unapproachable record stands unequalled. It was made at my last five exhibits, competing against all birds in the American Classes.

AT PHILADELPHIA, PA., DEC., 1914

My total winnings were: Hen, 1, 2, 3, 5, 7. Pullet, 1, 4, 8. Pullet-bred Male, 1, 4. Pullet-bred Pen, 2. Special, Best Shape female. Sweepstake Special, Best Bird in American Class.

C. N. MYERS Box E. Hanover, Pa.



In this department we will answer questions pertaining to poultry. When special information in regard to diseases, etc., is desired, same will be furnished by mail to avoid delay. Ask your questions, let us help you.

Q. Would it be all right to use a rooster with pullets of the same hatching for breeding purposes next spring? How often ought roosters to be changed for breeding purposes?

A. If both your cockerels and pullets are strong and of good bone and size, it would be safe for one season to mate as you suggest, still we wish it to be understood that we do not approve of this, as there is too much chance taken in mating a full brother and sister together. We believe it would be best in the end to save a year's breeding by making some changes.

* * *

Q. Will you kindly advise me, through the columns of Everybodys, a good balanced ration. Can I use the following with good results: Corn chop, Kaffir corn, wheat, oats, peanuts, broken up. C. C. K.

A. A balanced ration depends greatly on the season and what results are expected. As a rule, one part each of corn, kaffir-corn, two parts of wheat and three parts of oats, are a good standard balanced ration.

The only experience we have had with peanuts was where they were roasted, but if I were to judge it from their value as roasted peanuts, would consider them very good feed.

* * *

Q. Will you kindly give me information on the following questions: (a) I am living in a city and have forty White Leghorns in which I take great interest. Is it necessary that they have a yard in which they can scratch. My coop is plenty large and has a small run for them, with wooden floors. My birds always have a dirty appearance. On the inside of the coop I feed dry grains, mash, beef scraps etc. (b) I have a hen that is apparently healthy, lays regularly, but she does not seem to be able to stand any length of time. Looks like leg weakness. Could you advise me what to do with her?

A. (a) A yard for chickens is always advisable where eggs for breeding and strong fertility are wanted. I do not consider it a necessity for laying fowls. If kept indoors in a clean, light and airy coop, have seen fowls kept this way for years with the best possible results in egg production. The one secret is to give them plenty of green foods with plenty of litter on the floor for them to exercise in.

(b) Your hen prabably has leg weakness. If it were rheumatism, do not think she would keep on laying. For leg weakness we would advise you to feed more green food and grit, also more hard mineral food and arrange for a better general ration than you are probably feeding. Would also advise you to try the following: Strychnine, 1 gr.; cehate of iron, 1 dram; phosphate of lime, 1 dram; quinine, a small Us-sulphate, 15 grains. Make into thirty pills and give one two or three times a day.

* * *

Q. Will you kindly answer the following questions through Everybodys Question and Answer department:

(a) In preparing a bird for the show room (White Leghorns) what is the best way to clean them? (b) To remove dirt from under the scales of the shanks? (c) At what poultry exhibitions the coming year are there prizes offered for best shape, color, etc? This to apply to table eggs.

C. S. N.

A. (a) All white birds at their best should be thoroughly washed. This is an art in itself, and unless you have had experience you had better practice on some other common birds first. Use luke warm water and a good pure white soap, ivory preferably. See that the bird is soused thoroughly. You should use at least three different waters. In the first and second be sure to get all the soap out and dry in a good warm room. Would really advise you to practice this on a few common birds first and see the results you have, if you want to do a thorough job on the birds you wish to show.

(b) Wash legs and shanks thoroughly with soap and water. Hold them in the water for a while to soften all the dirt and foreign matter. Use a tooth pick to remove the dirt from the scales.

(c) Most all shows nowadays have specials for shape and color and also classes for eggs.

Subscribers.

Through no fault of the publishers it happens now and then that someone does not receive the issue of his magazine. We regret this very much and use all possible care in our mailing. We are interested in you, and wish you to have your files of "Everybodys" complete, for every issue contains much of interest and benefit to all. In case you do not receive your copy, drop us a card and we will mail another copy the same day to you.

POULTRY AND PIGEON SHOW
OCTOBER 12th, 13th, 14th and 15th
W. F. SPAHR, Secretary, Hagerstown, Md.
ENTRIES CLOSE OCTOBER 2nd

IN THE GOOD OLD DAYS

Under this head we will monthly publish a select line of articles published years ago that are of special interest to the breeders of this age. We also ask for contributions for this department either in books, Poultry papers or in manuscript form.

THE PROFITS OF FOWL KEEPING

Poultry World 1872

Anyone who carefully collects the statistics of eggs and chickens and the cost of feed at all the neighboring farms where accounts have been kept who reads the statements printed from time to time, especialy those accompanied by figures, who ransacks the reports of the local agricultural societies (made in the good old days when premiums were given for "Creoles" and "Natives" and the sensible regulation was enforced requiring the exhibitor to give a written statement of the number, management, and produce of his whole flock, with the cost of feed for a year) and last but not least, he who repeatedly under various circumstances, as regards breeds and feeding, must reach the certain conclusion that hens do now in this contry, and have for the past twenty years, paid a high profit. It is also true that the difference between the money paid out for feeding fowls and the same gained from their produce tends constantly to increase in New England and the Middle States, as is evident from the comparison of the market rates through a series of years.

At the time of the earliest settlements in the Atlantic states, before the woods were cleared, grain was too scarce to be fed to fowls, and but few were kept. But at a later stage of events, when sunlight had been admitted to broad clearings and the mould of primitive forests produced good crops, poultry became so abundant that more eggs were produced in farming communities in spring, than could be possibly used in home consumption. At that time, the great city markets that now make an insatiable demand for eggs and chickens had not grown up. Consequently in those "old times," as people now living have heard in their childhood, eggs actually accumulated in April and May till boys in frolic pelted each other with them, and their elders would interfere, less to save the eggs than the cleanliness of the tow pantaloons and checked aprons of the urchins. But every year the proportion which city bears to country has been increasing in all the Atlantic States, until at the present time fresh eggs are in great demand. As western competition continually presses with increasing force on eastern farmers, in the matter of beef and grain raising, we begin to hear the shrewdest among them declare their poultry farms the profitable department of their farms, in proportion to the labor involved. The ever awake Westerners are on hand in this matter also and find that poultry means money, notwithstanding they have been despising it as too petty a concern for people accustomed as they are to "big things" and they are now sending to the East enormous quantities of eggs and live and dressed fowls.

GOLDEN PENCILED HAMBURG breeders and prospective breeders of this beautiful variety, we want to organize a club, create an interest, and exhibit what you have at the Fall and Winter Shows. An energetic, hustling man or woman wanted to assume the secretaryship. Get busy and send your name to

SUNNYBROOK FARM'S WYANDOTTES AND LEGHORNS
We have the largest and best lot of chicks that the farm has yet turned out. Exceptional bargains in breeders including 500 choice Leghorn hens and one-half of our White and Columbian Wyandotte breeding females.
We shall be in a position to supply SHOW BIRDS for the very EARLIEST SHOWS.
EXTRA CHOICE TWELVE TO 15 WEEKS OLD WHITE LEGHORN PULLETS IN ANY QUANITY AT $1 EACH
Charles D. Cleveland
Box 50 - Eatontown, - New Jersey

ROBINS

(Planesticus migratorious)

Length, 10 inches.

Range: Breeds in the United States (except in the Gulf States) Canada, Alaska and Mexico; winters in most of the United States and south to Guatemala.

Habits and economic status: In the North and some parts of the West the robin is among the most cherished of our native birds. Should it ever become rare where now common its joyous summer song and familar presence will be sadly mised in many a homestead. The robin is an omnivorous feeder, and its food includes many orders of insects, with no very pronounced preference for any. It is very fond of earthworms, but its real economic status is determined by the vegetable food, which amounts to about 58 per cent of all. The principal item is fruit, which forms more than 51 per cent of the total food. The fact that in the examination of over 1,200 stomachs the percentage of wild fruit was found to be five times that of the cultivated varieties suggests that berry-bearing shrubs, if planted near the orchard will serve to protect more valuable fruits. In California in certain years it has been possible to save the olive crop from hungry robins only by the more strenuous exertions and considerable expense. The bird's general usefulness is such, however, that all reasonable means of protecting the orchard fruit should be tried, before killing the birds.

Vegetable foods form 58 per cent of the stomach contents, over 42 per cent being wild fruits and only a little more than 8 per cent being possibly cultivated varieties. Cultivated fruit amounting to about 25 per cent was found in the stomachs in June and July, but only a trifle in August. Wild fruit on the contrary, is eaten every month and constitutes a staple food during half the year. No less than 65 species of fruit were identified in the stomachs; of these the most important were 4 species of dogwood, 3 of wild cherries, 3 of wild blue berries, barberries, service berries, hackberries and persimmons; together with 4 species of sumac and various other seeds not strictly fruit.

The depredations of the robin seems to be confined to the smaller and earlier fruits, few, if any, complaints being made that it eats apples, peaches, pears, grapes or even late cherries. By the time these are ripe the forests and hedges are teeming with wild fruits, which the bird evidently finds more to its taste. The cherry unfortunately for man, ripens so early that it is almost the only fruit accessible at the time when the bird's appetite has been sharpened by the long continued diet of insects, earthworms, and dried berries, and it is no wonder that at first the rich juicy morsels are greedily eaten.

While the robin takes some cultivated fruits, it must be remembered that being a natural enemy of the insect world, it has been working during the whole season to make that crop a possibility, and when the fruit ripens, the robin already has a standing account with the farmer for services rendered with the credits up to this time wonderfully on his side.

Since the robin takes ten times as much wild as cultivated fruit, it seems unwise to destroy the birds to save so little. Nor is this necesary, for with care both birds and the fruit may be preserved. Where much fruit is grown it is no great loss to give up one tree to the birds, and in some cases the crop can be protected by scarecrows. Where wild fruit is not abundant, a few fruitbearing ed will serve for ornament and provide food for the birds. The Russian shrubs and vines judiciously plant-mulberry is a vigorous grower and a profuse bearer, ripening at the same time as the cherry. So far as observation has gone, most birds seem to prefer its fruit to any other. It is believed that a number of mulberry trees planted around the garden or orchard would fully protect the more valuable fruits.

IMPORTANT MEETING OF POULTRY PEOPLE ALLENTOWN FAIR WEEK

In order that the poultry fanciers of the State of Pennsylvania (and perhaps nearby points in other states) may be able to send their birds to the great Panama-Pacific Exposition Poultry Show, San Francisco, November, 1915, at a minimum of expense and risk, it is proposed that a suitable car be equipped with Empire or other similar coops with feed and water cups; that a good caretaker be employed to go with the car and see them safely out and safely back and that this car start at Philadelphia and stop enroute at Harrisburg and Pittsburgh.

In order to get the fanciers and breeders organized and the thing started, the undersigned hereby calls a meeting for Wednesday evening at 8 o'clock (parlors American Hotel) during Allentown Fair Week. Representatives of the various railroads and express companies will be in attendance and the meeting will be well attended and by forming a permanent organization then and there, can do business at once.

For any further information address the undersigned. W. THEO. WITTMAN.

Mt. Gretna, Pa.

FERRIS WHITE LEGHORNS

A new advertiser this month is the Ferris Leghorn Farms, Grand Rapids, Mich., one of the largest White Leghorn Farms in the Middle West. Our readers have probably heard of Ferris S. C. White Leghorns, for they have been one of the leading strains for 15 years, during which time they have been carefully bred to increase egg production and at the same time have been winning at many of the largest shows.

Ferris Leghorns are sold under the most liberal guarantee that any breeder can give. If not satisfactory in every way they can be returned and money will be refunded—if they die or get out of condition within 30 days they will be replaced free. They will also be shipped C. O. D. if desired.

Mr. Ferris is quoting special prices during the next 30 days on all grades of breeding and exhibition stock, The winter prices always are reasonable, but the prices now are 30 to 50 per cent. less than usual, because he wishes to reduce his flock before putting them in winter quarters. Laying and breeding pullets and yearling hens can now be bought as low as $1.50, choice breeding cockerels as low as $2.50. These birds have laying qualities bred in the bone and will improve your flock. Exhibition birds as low as $5.00 for hens and pullets; $10.00 for cocks and cockerels, offer an opportunity not to be missed. Address George B. Ferris, 921 Union Ave. N. E., Grand Rapids, Mich.

Oats Sprouter $2

For $2 you can buy the best Oat Sprouter on earth; easiest to operate. A boy with saw and hammer can make one in an evening. Plans 25c.

JULY REPORT OF MISSOURI AND NATIONAL EGG LAYING CONTESTS, MOUNTAIN GROVE, MO.

Relation of Shape to Egg Production. —Rhythm of Egg Production.— Barred Plymouth Rocks in the Lead in Missouri Contest for July and for nine months.—S. C. White Leghorns in the Lead in National Contest for July and for the Nine Months.

WHETHER the shape of a hen's body influences egg production or egg production influences her shape, or both, we cannot say, yet we do see good egg producers have triangular shaped bodies, in the form of a wedge, the back being one side of the triangle, the breast being another, and the third side being the distance from the pelvic bones to the back point of the breast or keel bone.

It matters little whether shape influences egg production or egg production influences shape, for the fact remains that the hens which are producing large numbers of eggs usually conform to this wedge shape, and we believe that something can be told of pullets even before they begin to lay.

RHYTHM

Shape assists, therefore, in selecting the best producers. But where it is possible to trapnest for at least thirty days, much can be told of a hen's value as an egg producer by the rhythm of egg production. The number of eggs produced by a hen without missing a day is called a cycle. The number of eggs in each cycle tells whether the egg organs have the ability to produce eggs rapidly and the frequency with which these cycles are repeated tells whether the hen has a constitution which will stand up under the strain of egg production. In other words, the number of eggs to the cycle tells the hen's breeding and repeating the cycles tells of the constitution.

If a hen lays four or more eggs to the cycle and repeats the cycle with only one or two days missed, she is a good hen. If a hen lays three or less eggs to the cycle and misses two or more days between cycles, she is of little or no value as an egg producer.

The hen which lays 20 or 30 eggs in one cycle and then misses ten or fifteen days should be classed with the hen which lays regularly but lays only one or two eggs to the cycle. The first has well developed egg organs with a weak constitution, while the second has a strong constitution and weak egg organs.

This method of selection is of value where the hens are trapnested for only two or three months during the breeding season or if a hen has been trapnested during the breeding season and should get killed, the rhythm of egg production would give an idea of the value of the offspring.

* * *

The Barred Plymouth Rocks in the Missouri Contest, and the S. C. White Leghorns in the National Contest are in the lead as pens for July and for the nine months of the contest. As individuals the S. C. White Leghorns lead the Missouri Contest, and White Orpingtons the National.

Pen 40 Barred Rocks from Missouri won the silver cup in the Missouri Contest, by laying 105 eggs during July.

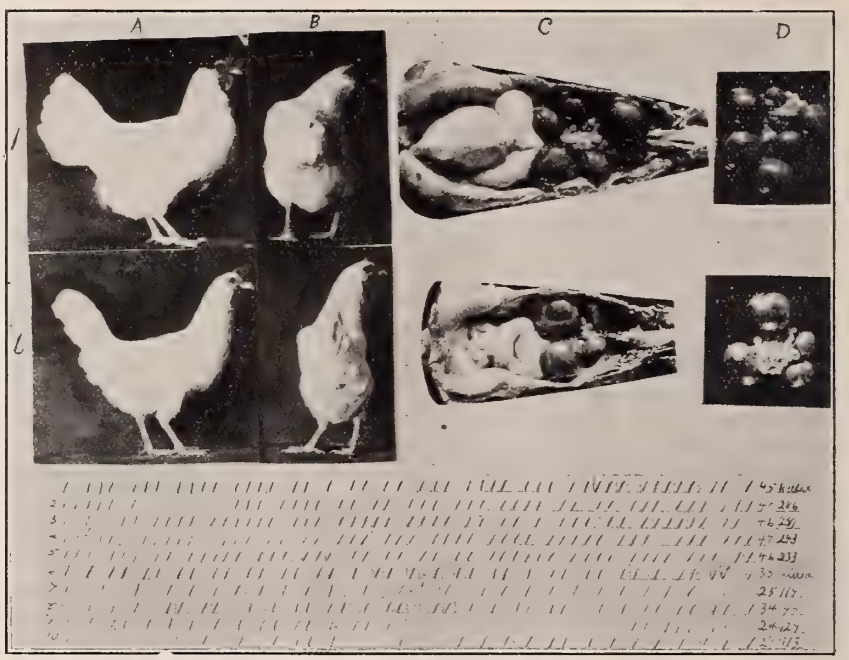
Pen 12 S. C. White Leghorns from Texas won the silver cup in the National Contest by laying 103 eggs in July.

The cups were won for June by Leghorns in Missouri Contest by laying 115 eggs, and by Leghorns in the National Contest with 94 eggs.

It will be noticed that the winners in the Missouri Contest layed 10 eggs less in July than in June, but the winners in the National Contest laid nine eggs more than in June.

The ten highest pens in the Missouri Contest for the nine months are as follows:

Pen 34,	Barred Rocks.....	812 eggs
" 40,	Barred Rocks.....	806 "
" 6,	S. C. W Leghorns..	773 "
" 38,	S. C. W Ply Rocks..	764 "
" 2,	S. C. W Leghorns..	748 "
" 10,	S. C. W Leghorns..	741 "
" 26,	Buff Wyandottes...	727 "
" 0,	S. C. W Leghorns..	725 "
" 28,	W. Wyandottes....	721 "
" 14,	S. C. W Leghorns..	706 "



The above illustration shows two extremes in shape and rhythm of egg production.
No. 1 shows four views and a 60-day egg record of a high producing hen.
No. 6 shows four corresponding views and egg record of a low producing hen.
A shows a side view, A1 showing wedge shape and A6 rectangular shape.
B shows rear view, showing width of body, width between legs etc.
C shows the backs of two hens looking from the center of the hen, showing C1 wedge shape and C6 more nearly a rectangle.
D shows the ovaries of the same two hens, showing development of the yolks
The record of No. 1 shows that she can develop more than four eggs in one cycle, then repeat the cycyle after missing only one day, while No. 6 never laid more than two eggs in one cycle.
D 1 shows six ovules regularly developed so they would have been laid in six consecutive days or one cycl, while D6 contains four yolks which contain a skip in development so they would have been laid in two cycles of two eggs each.
2, 3, 4 and 5 show the egg records for 60 days and the total for one year of hens with egg rhythm of No. 1, and are high producers, while 7, 8, 9 and 10 have rhythms which correspond with No. 6 and are low producers. The two hens were hatched and raised together, fed the same feed and all conditions were alike.

The five highest pens for July were as follows:

Pen 40,	Barred Rocks.....	105 eggs
" 6,	S. C. W Leghorns..	102 "
" '8,	S. C. W Leghorns..	99 "
" 34,	Barred Rocks.....	97 "
" 7,	Anconas	93 "
" 0,	S. C. W Leghorns..	93 "

The total number of eggs laid in the Missouri Contest for July was 3,501 eggs.

The ten highest pens for nine

months in the National Contest are as follows:

Pen 21, S. C. W. Leg'n, Eng. 733 eggs
" 1, S. C. W Leg'n, Pa. 692 "
" 75, R. I. Whites, Ill... 664 "
" 19, S. C. W Leg'n, Eng. 651 "
" 3, " " Penna.. 643 "
" 5, " " Ill.... 633 "
" 43, W. Orpgtn, Wiscon.. 629 "
" 29, S. C. Bk Leg'n, Ga.. 617 "
" 8, S. C. WLeg. Miss... 615 "
" 5, " " Kentky, 611 "

The five highest pens for July are as follows:

Pen 12, S. C. W Leg'n, Tex. 103 "
" 8, " " Kentky. 100 "
" 10, " " Pena.. 95 "
" 27, S C Buff Leg, Mich. 91 "
" 15, S. C. W Leg'n, Miss. 90 "

The five highest hens for nine months in this contest are as follows:

Pen 43, Hen 277, White Orpington, Wisconsin . . . . . 189 egs
Pen 21, Hen 129, S. C. White Leghorn, England . . . . . 171 eggs
Pen 1, Hen 2, S. C. White Leghorn, Pennsylvania. . . . 167 egs
Pen 67, Hen 412, Barred Rock, Illinois . . . . . 160 eggs
Pen 21, Hen 131, S. C. White Leghorn, England . . . . . 156 eggs

Pen 12, S. C. White Leghorns from Texas won the cup for July by laying 103 eggs.

The total number of eggs laid in the National Contest for July was 4,151 eggs.

PLEASED CUSTOMERS

We are always pleased to publish letters received from satisfied customers, who have dealt with our advertisers. The following letter explains itself. It is a stimulus to the business and we congratulate Mr. J. Courtney Punderford, owner of the Monmouth Farms, Freneau, N. J. H. P. S.

University Place, Neb
July 26, 1915

Monmouth Poultry Farms,
Freneau, N. J.

Dear Mr. Punderford:

Does it pay to buy eggs from the Monmouth Farms, of Freneau, N. J.?

Yes, in a good many ways it pays. My experience is given below.

March 6, 1915, I received 100 eggs from the Monmouth Farms. From these eggs I hatched 73 chicks. I could see from the very first that they had extra vitality. At the age of four weeks I began to weigh them. At that time I had fifty-one head, fourteen of which were cockerels and thirty-seven pullets. At three weeks of age these young chicks weighed one-half pound per head; at six weeks 1 1-4 pounds each and at twelve weeks, from 2 1-2 to 3 pounds each. At the age of five weeks I had one cockerel crowing; at six weeks two crowing and at seven weeks nine were crowing.

My choice of the cockerels couldn't be bought for $100. They are the kind that win at the big show and sire the females that lay the eggs. These pullets are wonders, and the thirty-seven head, all but the possible exception of six, are fit to enter and win at the good shows.

They are the kind that lay the eggs and the kind that have the color, long backs, well spread tails, and are all solid buff in all sections.

May 17th I received fifty eggs from exhibition mating. I hatched thirty-three chicks and have thirty of them today, July 26th. They average 1 1-4 pound and as good or better than the first hatch. Two of these cockerels crowed at five weeks.

I cannot say enough about the fair treatment that I received from the Monmouth Farms when buying eggs. Every egg was from the exact pen from which I ordered and were packed for shipment in the most painstaking manner. Only two eggs were broken out of 150, these eggs being shipped 2,000 miles.

The above letter is a true account of my experience as a new customer of the Monmouth Farms. Anyone wishing a later report on the Monmouth Strain may write me and I will be pleased to give them further information.

Yours very truly,
CLIFFORD A. BARR.

By Jane Mills Da Mond
Williamsport, Pa.

In your August number of Everybodys, you quote from the American Bantam Fancier to the effect that Bantams "are not suitable for market, nor will eggs sell rapidly." Let me differ from this. I have given a good deal of attention to Bantams for over eight years, and I have no trouble with marketing them or their eggs. In fact the demand for "squab chickens," as they call them here, has been far beyond my ability to supply, and as I give fifteen of their eggs for a dozen, they go as fast as laid.

> From the Bantam Magazine, San Jose, Cal.
>
> Everybodys Poultry Magazine, Hanover, Pa., has a Bantam department called "Our Bantam Friends." The subject in the July number is "Light Brahma Bantams," which is interesting. Everybodys is a dandy poultry paper, and no doubt many Bantam breeders would do well to subscribe to it if they have not already done so.

One thing I would like to say in the Bantam's favor is that for raising Guineas, they have no equal. My greatest success and profit has come from Guineas, and my Bantams must be given credit for all attained. Let a Guinea start out at daylinght with her flock of little ones, and befor the sun is up, she will have them wet and chilled from the dew as well as their "legs run off." The result is that before they get really strong, many will be lost. There is none of this trouble with the Bantam mother. She is as tender, careful and proud of her foster flock as though it was her own.

Another thing, Guineas raised by Bantams are tame and easy to care for as they grow up. They seem to lose the wild characteristics. Nearly all my breeding flock are so tame and domestic that I can pick them up as I do any other fowl.

Let me express my pleasure over reading Everybodys. It is the best poultry magazine I have ever taken, and I have had several.

GIVE THOSE MOLTING HENS NEW FEATHERS—QUICK

Growing new feathers takes strength, and your hens may not start laying this winter unless you start now giving them

Pratts POULTRY REGULATOR

COSTS ONLY A CENT A HEN A MONTH

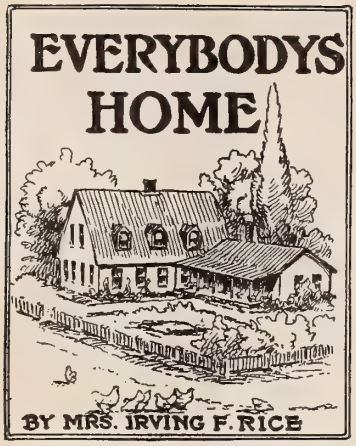
It shortens the molt, brings about speedy recovery. Keeps up vitality, and makes steady all winter layers.

"I have never had a hen or pullet that would not lay in cold weather after giving Pratts Poultry Regulator. I have sold eggs at 85c. a dozen," said Mr. H. C. MORGAN. "I would not be without it."

After you have used it, if you are not fully satisfied, go back to your dealer and get your money. Get a 25 lb. pail at $2.50. Packages at $1.00, 50c. and 25c.

To kill lice and mites, destroy germs and prevent disease, use Pratts Poultry Disinfectant. Quarts 35c., gallon cans $1.00. Pratts Powdered Lice Killer in sifter top cans at 50c. and 25c.

PRATT FOOD COMPANY PHILADELPHIA CHICAGO TORONTO



THE pullets hatched the 23rd of March have developed so finely that some have commenced to lay at exactly the age of four months and fifteen days. While we are always rather proud of having such precocious youngsters, still we know that it will not be profitable to have the cock come into laying at this season. As we have learned by experience that when pullets commence to lay in August or even the first of September, they are very liable to go into a second moult about the time that the first chilly fall weather arrives, and then they will feather so slowly that they will be boarders until late in the winter, while if they can be kept from laying until the first days of October they will then continue through the winter months when eggs are golden and much to be desired. For this reason we have taken the meat food from these pullets' menu, which will delay them and at the same time permit them to gain more strength to carry on the egg campaign which they are expected to profitably conduct through the days when the hens are getting into profit, and when the prices are highest. If they can be kept from laying until they are older, which is very easily managed, they will also lay larger eggs and will not suffer a set-back from the change from summer quarters to winter laying houses. Pullets will commence to lay earlier in the fall than yearling hens, but when the hen does commence, her eggs are of marketable size from the beginning and will demand the highest market price, while naturally the first eggs of the young pullets are rather small in size increasing in size with each egg, and, of course, cannot compete with hen's eggs for several weeks. However, these pullet eggs come at a time when eggs are scarce and dealers are so badly in need of fresh eggs that they are forced to be lenient, and an egg that would be discarded in the middle of the winter, will be used at this time.

It is not wise to force the hens, which will be used for breeders another spring, if they are somewhat slow in coming into profit, they are more apt to continue laying longer stronger for incubating.

Many breeders do not allow their hens which are to be used for breed- next spring and the germs will be ers to be fed a laying ration until the later days of January, then they are forced for eggs and will lay eggs which will produce good sized chicks of strong constitution which will live and grow with less care than those hatched from eggs which were laid by hens, which by their continued egg production through the winter months have become weakened. We never use pullets for breeding purposes unless there is an especial reason, such as a bird which has won distinction in some way or other, either by winning in exhibitions or by her precosity in early laying, etc. Fifteen good yearling hens and a good strong, active cockerel give the best of results in breeding yards.

Now that the young stock does not require our undivided attention it is a good time to be getting the winter quarters in readiness and to go through our annual house cleaning. There is always some repairing to be done. Perhaps the cement floor has become warped or cracked, and will later let the cold air in, or make the floor hard to clean through the long winter months. This is an ideal time to repair that, with the hens in the yards all day. Broken window panes or muslin frames can now be fixed, so that when the fall weather, which is sure to descend upon us before long, does arrive, we shall have everything snug and comfortable, both for the hens and for ourselves. Our houses are annually treated to a coat of whitewash, after they have been thoroughly cleaned and fumigated, for which last purpose we use a large smudge of sulphur. This will kill any insects and disinfect it and give it a wholesome cleanly smell. In making this smudge some facts were learned from a doctor friend who informed us that to get the best results we should use "Flowers of Sulphur"

Now is your opportunity. We are offering **500 CHOICE YEARLING HENS AT $1.50 EACH** for a short time These were our season's breeders and must go to make room for 2,000 March and April hatched youngsters.

They are now in full profit, laying **LARGE WHITE EGGS** which demand the fancy market prices. Will soon pay for themselves and make good breeders for another season.

Satisfaction Guaranteed

Irving F. Rice & Son

R. D. No. 7 Cortland, N. Y.

which should be mixed with plenty of moisture, and this is effected this way: A large iron kettle is placed in the room in which pails of water have been emptied, in the center of the kettle an island is made by an inverted pail over which the burning sulphur is set. To make the sulphur fire take an old pan, place the sulphur in the pan making a volcano in the center of it, leaving the crater in the center, into which an alcohol fire is started. The heat of the fire will gradually melt the sulphur which will run into the crater or center, and in this way the fire will burn much longer and better results be obtained than if the whole mass is lighted at once The kettle of water not only provides the moisture needed, but makes a safe protection from fire as well, and the house can be closed and left to its evil smell without fear of fire. After the fire has run its course, open all windows and doors wide, before the hens are allowed to enter.

Some of the houses have what is familiarly called among poultrymen "straw lofts." The straw from these lofts should be removed before smudging. The new straw will help the clean fresh smell, and any hen with a particle of hen sense should be grateful for all of this thoughtfulness and show that appreciation by doing her best to fill the egg basket.

Speaking of houses with straw lofts leads us to say right here and now that old breeders notwithstanding, I would not build such a house, neither would I advise any one to do so. Of course, they have favorable points but they have proven with us, to be harbors for lice and mites and a musty smell, which overcomes its good points, chief of which is the ventilation afforded and which need not be considered if muslin windows are used, mixed with a liberal allowance of common sense, which will advise the breeder to open doors in suitable weather, and thus afford a better ventilation than can be obtained through musty, dusty, smelly straw. I do not believe that they are finding as much favor among breeders as they did a few years ago. There are as many kinds of houses as there are varieties of fowls, and everyone must decide for himself the one most adapted to his needs and likes. The only advice I would offer to the beginner is, to epend as little money as possible in building a house that will answer your requirements.

If machine oil gets on a garment when you are sewing, rub with common chalk and the stain will disappear.

* * *

To avoid breaking baked fish, when removing from the oven place fish on a piece of clean cold muslin well greased and bake, when done gently lift the cloth to the platter, when the cloth may be carefully removed from beneath the fish without injuring the tempting looks of the fish.

* * *

There is a sign pointing to poultry success; it reads :Plenty of hard work mixed with common sense and intelligence. The sign to failure is the same as in all manner of business and reads: "Carelessness."

* * *

Any housewife is liable to such accidents as burning cake or bread. This incident can be easily overcome by using a grater to rub the scorched surface with.

* * *

For a change in flavor, which is pleasing to most people, try using left over coffee in making the standby cake, instead of milk.

* * *

Worry at meal time and hurry immediately afterwards are twin enemies of health and happiness.

* * *

Dip the soles of your shoes into melted wax once in three weeks, and they will wear much longer.

* * *

The hen that lays the golden egg is not the hen which is poorly fed.

Buff Orpingtons are a favorite variety East and West, North and South. Every section has its prominent breeders, and every breeder has credit due him for the quality this variety possesses in form, color and real practical worth. The "Fashion Plate" line of Buff Orpingtons, bred by A. E. Martz, Box E, Arcadia, Indiana, have long been fixtures, known for rare and sound quality. That Mr. Martz is an intensive fancier and breeder goes without saying. His success is surely well deserved.

SEASONABLE RECIPES

Vegetable Salad—Cut in small pieces three boiled beets, two large potatoes, also boiled, a carrot and

one head of lettuce, add salt and pepper and salad dressing; garnish with hard boiled eggs.

Mint Sherbert—One half pint of mint leaves, one and one-half cups of sugar, juice of five lemons, two tablespoonfuls of granulated gelatin, whites of two eggs and two quarts of water. Dissolve the gelatin in one-half pint of boiling water and allow it to cool; wash the mint thoroughly, mix with the sugar and lemon juice and let stand one hour, place in freezer and when nearly frozen add the beaten whites of eggs and gelatin; pack and stand for a time to ripen, serve in sherbet cup with maraschino cherry on top.

Cocoanut and Apple Cake—Make small drop cakes out of one egg, one-half cupful of sugar, one-half cupful of milk, one and one-half cupful of our, into which has been sifted one teaspoonful baking powder; drop and bake and when cold lay on top of each cake half an apple which has been boiled until tender in a syrup made of one cupful of sugar and one-half cupful of water, and sprinkle with cocoanut.

Crisp Cucumber Pickles—Wash small cucumbers, wipe dry and pack into quart cans, on top of the pickles place one tablespoonful of salt, one tablesponful of sugar and piece of alum the size of a small pea, fill can with cold vinegar and seal. These pickles will keep splendidly and are crisp and hard.

Egg Salad—Remove the shells from hard boiled eggs, and with a sharp knife cut through the white from the small end nearly to the base, cutting in narrow strps about the size of pond lilly petals, deftly remove the yolk and place the white petals upon a lettuce leaf, devil the yolks by adding a boiled salad dressing and place is the center of the lilly, sprinkle the top with paprika and you have a very pretty and palatable salad.

FIRST ANNUAL SUMMER FIELD MEETING

New Jersey State Poultry Association, September 9, 10 and 11, 1915

Thursday, September 9th, A. M.—Address of Welcome by Dr. W. H. Demorest, president of Rutgers College. Addresses by F. H. Freelingheisen, president State Board of Agriculture; Hon. L. M. Markey, senator from Monmouth County.

2:30 P. M.—J. H. Wolsieffer, Vineland, N. J., president N. J. State Poultry Ass'n, the N. J. Poultry Association.

ANNOUNCEMENT

JAMES A. TUCKER

Royal Oak, Mich., one of America's best known and capable Poultry Judges and Breeders, has accepted a position on the Staff of "Everybodys Poultry Magazine," to report the shows and exhibitions he visits and to look after the advertising interests and wants of the breeders.

We heartily commend Mr. Tucker to all, give him your support and full confidence, for his efforts in this new field will increase his value to the industry and add additional prestige and value to

EVERYBODYS

1:00 P. M.—Annual meeting of the State Poultry Association.

The "Key-Ring-O" Leg Bands, manufactured by Newell and Gordinier, Troy, N. Y. Dept. B, have been accepted by poultrymen throughout the country as a band which meets every requirement. This band is very light absolutely indestructible, and being made in nine different colors, cares for that many matings to be distinguished at a glance by the owner. If you desire to keep your records, these bands are indispensable. Write today for a sample band or order direct from them. Advt. on another page of this issue.

Gold Medal and Highest Award for dog foods at the Panama Pacific Exposition has been given to Spratt's Patent, Newark, New Jersey.

Is this surprising when you are told that three (3) shows recently, over 3,000 prizes were won by dogs fed regularly and exclusively on Spratt's Dog Foods;

The products manufactured by this Company have been on the market for over fifty years. During this period they have received the highest honors at all the principal national and international expositions, a convincing proof that merit wins in the long run.

There are more prize winners reared and fed on Spratt's dog foods than on all others combined.

Spratt's patent will bench and feed the Panama-Pacific Dog, Poultry, Cat and Pet Stock Shows. These exhibitions are among the largest and most important held in the country and the fact that the contracts for all the above mentioned shows have been awarded to this well known firm, speaks volumes for their up-to-date methods, efficiency, etc.

WHEN ANSWERING ADS—
Always mention "Everybodys."

The Westmoreland Chemical and Color Company, 925 Chestnut Street, Philadelphia

Some Breezes From the Mid-West

BY THEO. HEWES.

THERE is considerable interest throughout the Mid-West in regard to the San Francisco Exposition. A great many breeders have expressed a willingness to go, and meetings are being held at all of the large exhibitions to adopt some plan of transportation charges on live stock but none of the states have appropriated a sufficient amount of money to cover all of the exhibitions as the breeders would like to have them covered, and, as usual, in cases of this kind, the horse, cattle and swine men seem to feel that they are entitled to the greater part of the appropriation.

The Indiana fanciers will have a meeting at the State Fair Wednesday, September 8, when they will decide on whether to ship by freight or express. The transportation companies have been invited to attend this meeting and submit their rates, and give to the prospective exhibitors such information as will be of general interest.

At this writing it looks as though there might be three or four carloads of poultry and about twelve or fifteen carloads of other stock. But unfortunately, no two classes exhibit at the same time at Frisco; consequently there can be no combination of shipments, and, as, usual, poultry is the last to be considered, and must take whatever is left.

* * *

The selection of judges for the Frisco Exposition has been somewhat of a disappointment to a great many that had hoped to go. It is true, all states have been taken care of, and Indiana is one of the two that has two judges assigned. While there seems to be no criticisms of the judges who are to officiate, many had planned to go and it was a sore disappointment to them to be turned down.

* * *

We are wondering if the meeting of the American Poultry Association held late in November, and so far away from the center of population, will bring out as enthusiastic a gathering as we could have had, had the meeting been held somewhere in the central states, at our regular time—the second week in August. While we feel that the Association has been very kind to the exhibition company by changing the dates and selecting San Francisco for its annual meeting, we are under the impression that there will not be as much important work transacted as there would have been early in the season; and we very much doubt if there will be as large an exhibit as there would have been. Our idea was that we should hold our meeting on our regular dates in August, and at that time plan for as many as possible, as could go, and through some arrangements have a train designated, leaving the Atlantic Coast and picking up the breeders from the several states until we had one, two or three solid trains; but it is too late to consider this now, as we will never have enough of the prominent fanciers together at any one exhibition to make this scheme a success.

From the above cut it will be see that Mr. F. B. Williams, Prop. of the West Mt. Poultry Yards, produced some excellent type birds years ago. He has always admired and bred a fairly close feathered, moderately short, hustling, business type White Wyandotte, and did much active work in securing the changes in the 1915 Standard. As Mr. Williams has been breeding for this type for nearly 20 years, he can make selections that will please from his 1,000 head of young stock.

* * *

While on the subject of American Poultry Association, did the readers ever stop to consider that we have recklessly spent a lot of money without realizing just where we are going to get any more money to spend. As we understand it, the Revision Committee is to meet again at San Francisco. Their expenses and their per diem is to be paid. The Standard is out and apparently is satisfactory. There will be some typographical errors crop out for correction, but really we cannot see the necessity or sense in the Association going to the expense of paying this committee to go from all sections of the United States to San Francisco to find a few errors that in the majority of cases will be pointed out to them by someone else. We have drifted from one expensive committee into another until every time a man takes the floor to make a motion, one begins to wonder what committee he has in mind that will take another pull from the treasury. Every time one offers a criticism or suggestion, some little fellow will bob up and say he is a "knocker" and the American Poultry Association is the great I. M., and no one should at any time or place criticise its actions. But it is well to remember there are a few people in the United States today that were at the early making of the American Poultry Association, who spend many hundreds of dollars and much valuable time to promote the interests and to give this Association a chance to get on its feet and now if some of this old gang, after 25 years of experience cannot give the present officers cards and spades on financing the Association, then I am an awful bad guesser. Looking at the American Poultry Association from any angle, we do not know of any business that we have ever been associated with that could possibly succeed under its present management. Perhaps some of us are too old to catch on to the down-to-date methods and possibly we were always a little behind the times, but it is well to remember that the old gang that built the American Poultry Association were a bunch of pretty live wires.

* * *

And speaking of old timers, brings back some memories and a little inci-

dent that happened years ago that might be of interest to Everybodys readers.

Along about 1886, 7 and 8, there was held in Chicago in the old exposition building on the lake front, where the new art building now stands, some of the greatest poultry shows that were staged in America at that time. This building was very much after the style of Convention Hall in Kansas City, except that the building was frame. The live stock and other displays were on the main floor, while the poultry was staged in the gallery. It was at these shows that Frank Sewell made his first entry and submitted his first picture.

Many of the fanciers that are now dead were prominent exhibitors at that time. I remember one year

"FASCINATION"
First and Special Cockerel at Philadelphia, Dec., 1911. Also winnr of the Philadelphia Record Cup, North American Cup and Pratt Food Co.'s Cup at same show. Owned by S. M. Goucher, Moorestown, N. J.

there was a strong rivalry in the Barred Rock class and the late Sid Conger, of Shelbyville, Ind., was very anxious to make a winning. This was just about the time that the light Barred Pullets were becoming popular, and Uncle Dan Christian, of Roanoke, Indiana, was breeding some of the best in the country, and in order to make the winning sure, Mr. Conger had ordered several pullets from Mr. Christian and had them shipped direct to the exposition building.

Old Patrick Jacobs, who was then publishing the Poultry Keeper at Parkersburg, Pa., had formed a strong dislike for Mr. Conger and was looking for an opportunity to take a shot at him. So when these birds came in with Mr. Christian's cards on them, Uncle Pat got busy. He sent out for a photographer and had the Christian's shipping tags and was preparing an article for his readers, telling how Mr. Conger, unable to breed winning Barred Rocks, found it necessary to buy them and herewith submitted a proof in the form of a photograph showing shipping crates and birds.

It soon became noised about the show room that Jacob was going to get Conger's goat, and Uncle Bob Braden, the editor of the Ohio Poultry Journal; George Pitken, of Chicago, and the late B. N. Pierce, of Indianapolis, started to hatch up some scheme that would satisfy Mr. Jacobs without making themselves too conspicuous.

The show was held early in Novem coops photographed, showing Mr ber and we struck one of these miserable weeks that we find often in Chicago at this time of the year. The mist came off the lake until we could hardly see and it was very cold and disagreeable. The building was poorly heated and everybody was hovering around the gas stove in the secretary's office. I had Uncle Pat Jacobs all to myself. He had outlined a policy that he had proposed to pursue against Mr. Conger He was going to put Uncle Sid out of business. Fnially he drifted into home talk and told me how respected he was in his own neighborhood, that he was a leader in Sunday school and church work and quite a few other things that Uncle Pat was in the habit of giving in confidence to his intimate friends. I was taking it all in, but thinking all the time of my friend Conger. I finally said to Mr. Jacobs: "I know you that are not a drinking man, and I am following a business that will not allow me to become intoxicated, but this is one miserable day and I really believe that one drink of whisky might do us both good, and if you feel so disposed, we will walk across the street, get a seat in the back room and have a little drink."

After making about three efforts to cough and finding it was a "fizzle," he decided it was a good proposition and he seconded the motion, which was carried unanimously. We slipped real sociable. We ordered all around once more—then Uncle Bob Braden slipped in and the rounds were all called for again. By this time Jacobs was thoroughly happy. He loved his wife, the hired girl, all other women in the neighborhood, and really he began to love Sid Conger just a little.

Mr. Braden and myself were trying to swing the conversation in the right direction, and to help matters along Ben Pierce found it was a little too dark to work in the show room, so he slipped over and joined us. He broached the subject of the Conger write-up and told Mr. Jacobs that he believed he was a trifle hasty in forming his opinion, and, of course, another round was required to get it thoroughly fixed in Uncle Pat's brain, and about this time Sid Conger and George Pitken came in.

They came up to the bar, and, of course, I invited them to have a drink Pitken said: "Mr. Hewes, we would like very much to drink with you, but really, under the circumstances, we cannot tolerate your friend. He is here for the sole purpose of putover into the saloon and ordered Manhattan cocktails.

I don't know who the bartender

was, nor where he came from, but the long-legged youth was certainly an artist in making Martina cocktails. He has probably made a fortune long before this and settled down, but that afternoon we kept the young man reasonably busy. I ordered two drinks before Uncle Pat thawed out. Then he came across with one, and the bartender realizing that he had some "easy picking," decided it was time for him to do something. By that time Mr. Jacobs was getting Mr. Conger out of business and he is not willing to give Mr. Conger even a chance to defend himself." "Well," I says, "you boys have been friends too long to quarrel over some foolish thing, now suppose we all have a drink and shake hands and forget our troubles and go back home and love one another as we have in the past."

This gave Conger the key to the situation and he says: "Until Mr. Jacobs apologizes before you gentlemen, I positively will not drink with him."

Then Uncle Pat got down on his knees in the sawdust and begged the pardon of Mr. Conger and Mr. Pitken, and asked that the other gentlemen present be witnesses to the affair, that he had forever buried the hatchet—that it was all a mistake; said that Conger had done more for the chicken business than any man he knew of and that he would go home and give Conger a good write-up.

The whole thing would have stopped there and peace and harmony would have roosted on the head post of Uncle Pat's bed, but Uncle Bob Braden could not stand the pressure. He went home, got out a full page cartoon. The main setting was the interior of a saloon. Sid Conger and George Pitken made up as two old roosters, with an elegant likeness of themselves for the heads, while Uncle Pat Jacobs was depicted as an old hen, spectacles and all, down in the sawdust begging for mercy. While Bob Braden was an owl roosting in the shrubbery in the wineroom and taking it all in with a pair of field glasses. Fortunately I was left entirely out, but when Jacobs got sober and thought it over, he believed that I was responsible for the entire program, cartoon included, and until his dying day he never forgave me, and I think I have been represented more times on his editorial page with slurring, sarcastic comments than any one man in America, living or dead.

When our present day fanciers are imagining they are having a good time at the Flee Banquet and are introducing new features, please don't overlook the fact that the old timers used to have a night off every once in a while that would make your little parades around the last Pittsburgh show look like a dirty deuce in a new pack.

* * *

The Harrison-Curtis controversy has finally got into the court, where the case should have been tried in the first place; we understand Mr. Harrison has brought suit against the Reliable Poultry Journal Publishing Co. for $50,000, the case to be tried in the Federal Court.

It will now be up to this tribunal to say whether Harrison is the villian in the play, or whether Grant M. Curtis shall be judge, jury and prosecutor, all at the same time. There should be some fun when this case comes up before the executive board of the American Poultry Association at Frisco. It will no doubt help to break the monotony of the long trip.

Speaking of Harrison, isn't it remarkable how many people want to jump on a man when they think he is down. In the five years that Mr. Harrison advertised in the Inland Poultry Journal, when the writer was president of that publishing company, we had just one complaint against him. How many breeders can beat that record? Really, they are few and far between. We, unknowingly, got mixed up in this Texas deal, that brought out the twenty pages of editorial in the R. P. J. We were at Menominee, Mich., when the order was being considered, and helped Mr. Harrison select the pullets for this shipment. They were from the same yard and of the same quality as the first prize pullet and first prize young pen at Chicago in 1914, and it is well to remember that this show of reds will go down in history as the greatest Red show ever held in America. If they were not good enough for the money that was paid for them, then the price asked for show birds is entirely too high.

CONTENTMENT

I wonder just how many of us can say with Paul of Old,

"I have learned in whatsoever state I am, therein to be content?"

Suppose Mrs. Brown has three gowns to our one, or Mr. Black has a Packard while we have only a Ford —What's the use o' worryin' and frettin' away our lives in trying to live up to the income of our richer neighbors when we know we can't do it? Why not just be content and wear our one "best" gown with a smile, and travel about with our Ford filled to its capacity, with our friends?

Suppose our lines have not fallen in pleasant places—suppose we have to live day by day by the sweat of our brows, working as mere day-laborers or as mill-hands—can we not do our tasks with a will, with an eye open for the next step on the Success Ladder—that step to be gained by a cheerfulness, stick-to-it-ive-ness and plain honest grit?

And, finally, let's try to be like Browning's "Pippa" in "Pippa Passes"—"Pippa," the little factory girl, who, contented with her lot, ran merrily along the highway on her one holiday in the whole year, singing with a vim her "All's Right With the World," and unconsciously cheering all with whom she came in contact.

Our world is a good old world after all and let's enjoy it! Let's chase Mrs. Grumble away, for she dwells not where Contentment reigns supreme. A. S. D.

* * *

Last year there were 6,805 fires in the national forest reserves of the country. Some of them were mere blazes, but in 1,545 of the number burned over an area of ten acres or more. That was a lot of fine timber to go up in smoke uselessly.

DO NOT

Be afraid to advertise in "Everybodys" if you have anything to sell. Our advertisements form a market place that brings the buyer and seller together for trade.

WILL YOU DO THIS?

When writing advertisers, mention "Everybodys." Thanks.

The Springfield Ohio Poultry Association has inaugurated a new idea to increase interest in their coming exhibition to be held in the new memorial building at Springfield. Each member is working for cups, cash, etc., to be placed on their favorite breed, in turn the Association offers a cash prize to apply on the variety securing the most specials. Mrs. John Carter, of Springfield, is the secretary of this live, hustling organization.

* * *

The Northern Indiana Poultry Association announces December 6 to 11, as the dates for their coming exhibition at Marion, Ind. Mr. S. G. Case, Shreve, Ohio, is judge. Mr. O. D. Weesner, 1210 South Boots St., Marion, secretary, to whom all communications should be addressed.

* * *

The Hanover, Penna., Fair Poultry Show has always made a favorable impression with the fanciers of the East, and, today stands among the leaders as a Fall Poultry Show where the classes are large and the competition is keenest.

Mr. Chas S. Shirk, superintendent, can feel proud of this department of the Hanover Fair, as it has been through his untiring efforts that the poultry department has been brought to the present high place.

Premium List will be mailed you by addressing Poultry Dept., Hanover Agricultural Society. The offerings are most liberal, and special prizes eclipse if anything the prizes offered at many of our largest winter exhibitions. Resolve to show at Hanover, September 14, 15, 16 and 17. Entries close September 7.

AMERICA L. BRAHMA CLUB MEET GOES TO THE CHICAGO COLISEUM SHOW DECEMBER 10TH TO 15TH

In compliance with the vote of its members the Executive Committee of the American Light Brahma Club has decided to hold the next annual club meeting at the Chicago Coliseum Show. Already over 150 birds have been pledged and aproximately $250 in cash prizes will be awarded to Club members only. It will be remembered that the last annual meeting was held at Madison Square Garden in February and that as a result more Light Brahmas were on exhibition than any other one variety of poultry.

It is planned to surpass this record at the Coliseum Show and all the classes will be judged by E. W. Rankin, of Topeka, Kansas, a member of the executive committee of the club. Mr. Rankin judged L. B. Hens and Cockerels at the Madison Square Garden Club meeting.

The Club Quarterly Bulletin for July has just been published and will be sent free to anyone desiring a copy. The 88-page Year Book, with 45 illustrations and numerous interesting and informative articles on breeding, mating, raising and housing Light Brahmas is given free to Club members. Membership is only one dollar and this includes the annual dues to October 1st, 1916. Address all inquiries to Sec'y Harvey C. Wood, Bound Brook, New Jesey.

* * *

DISTINGUISHED JUDGES TO SERVE AT TRENTON, SEPT. 27-OCT. 1

Judges that have been selected for the Poultry Department of the Trenton Inter-State Fair ae classed as the best in America. They are distinguished not only for their integrity but for their ability, and have officiated at the largest shows in the United States.

Reese V. Hicks, manager of the Rancocas Farms at Browns Mills, has been engaged to serve this year. The other officials are the ones who gave such universal satisfaction last year.

To still furthe stengthen his force, Harvey E. Rogers, the superintendent, prevailed upon Mr. Hicks to act. Mr. Hicks was twice president of the American Poultry Association, and formerly editor of "Poultry Culture" of Kansas. He is recognized as one of the foremost Rhode Island Red judges in America, and was chosen to serve at the Panama-Pacific Exposition.

The judges for the Poultry Department at Trenton this year will be:

Reese V. Hicks, of Browns Mills, N. J.; H. P. Schwab, Irondoquoit, N. Y.; J. Courtney Punderford, Freneau, N. J.; J. Harry Wolsieffer, Vineland, N. J.; William G. Minnich, Carlisle, Pa.

The judge of the Pigeon Department will be Reuben Gibbs, of Trenton.

The indications for the Trenton Exposition are that one of the largest poultry shows ever pepaed for New Jersey will be seen this year. Superintendent Rogers is president of the Merce County Poultry Association and also a member of the executive committee of the New Jersey State Poultry Association. He is thoroughly informed on the progress made in the bird industry and his ability to arrange an exhibition is worth traveling to see was demonstrated last year.

Norwalk, Conn., Paultry Association have decided on November 23 to 25 as the time of their 1915 exhibition, also have engaged Paul P. Ives as well as Chas. T. Wells to place the awards. Several State club meets are anticipated and great interest is being srown. Mr. Chas. R. Petty, Sec'y, will be pleased to give our interested readers further information.

H. A. Pickett, Mattoon, Ill.—He will judge all Turkeys, Ducks, Geese, R. C. R. I. Reds and R. I. Whites.

E. M. Quay, La Porte, Ind.—Mr. Quay will judge Silver Wyandottes cockerels, pullets and pens; all Golden Wyandottes, all White Wyandottes and all Black Wyandottes.

W E. Stanfield Hillsdale, Mich.—He judges all Orpingtons but Buffs. He will also judge Black Langshans.

Z. B. Struble, Bascom, O.—He will judge all Buff Orpingtons, Silver Wyandotte cockerels and hens; Buc Wyandotte cockerels and hens.

Jerome A. Leland, Springfield, Ill.—Will judge all Columbian Wyandottes, all Columbian Plymouth Rocks, all Light Brahmas and all Black Minorcas.

Dr. H. P. Clarke, Indianapolis, Ind.—He will judge all Games, all Hamburgs, all Cornish Indians, all Buttercups, all Game, Risecomb and Mille Fleur Booted Bantams.

NOTE—This list is subject to change without notice, but it is our intention to place judges so as to please our exhibitors wherever possible, but in case of some not being able to complete their work on classes assigned to them in time, or for any other reason, we reserve the right to change list.

D. E. HALE, Sec'y.
E. J. W. DIETZ, Cor. Sec. & Supt.

* * *

The Poultry Fanciers' Association of Long Island, Inc., in taking their show from Hempstead to Brooklyn do so with the end in mind of giving the breeders and the trade a better setting for their exhibits and making the show more accessible to visitors. At Hempstead, although we had the largest hall obtainable and in addition to crowding the Fire Department out of their quarters, the available space was not large enough and some classes had to be discouraged from exhibiting, and waterfowl and pet stock excluded altogether. The attendance, while keeping up to the average of the shows of that size, was not large enough to justify the continued patronage of many of our exhibitors whose expense in sending big strings of crackerjack birds is not warranted unless these birds can be seen by a great many interested people. Our friends have always refused to consider this a local show—last year exhibits came in from Maine to Virginia—and Brother Card in his writings persists in mentioning Hempstead among the big ones.

For above reasons we seemed to have reached the parting of the ways. Either we must branch out into a national affair or disappoint our friends and restrict ourselves to local fields. Our conclusion was Brooklyn. Brooklyn, if separated from New York City would be the third largest city in the United States, and rated from the number of enthusiasts in breeding of poultry, pigeons and pet stock, is probably first. At one of the New York shows of last year the writer was privileged to look over certain lists of visitors who left their names for poultry literature to be sent them. The frequency with which the address Brooklyn appeared was very striking and seemed to indicate a very unusual interest in these lines, and in talking over the matter with poultrymen of National prominnce the possibility of a Brooklyn show was received with great enthusiasm.

Our show in no respect is in competition with the great institutions across the river; on the contrary, our dates are just enough in advance to enable exhibitors to try out their birds with us in preparation for those shows. The judges in many classes are the same, and all are of equal prominence. Those engaged up to the present time are as follows: Lester Tompkins, Concord, Mass.; J. C. Punderford, Freneau, N. J.; W. J. Stanton, New York; J. Harry Wolsieffer, Vineland, N. J.; Chas. M. Smith, Sayville, L. I.; J. E. Willmarth, Roosevelt, L. I.; Geo. W Weed, East Lee, Mass; H. P. Schwab, Irondequoit, N. Y.; L. D. Howell, Mineola, L. I.; Rowland Story, Brooklyn, N. Y.; Mrs. Louise Mirick, Sheepshead Bay, L. I., and F. G. Plath, Manchester, Pa.

* * *

MISSOURI STATE SHOW

Poultry breeders will have an exceptional opportunity at the Missouri State Poultry Show this year to place their fowls before a very large number of people who are just getting into the poultry work.

Through co-operation with the Commercial Club of Joplin, the Missouri State Poultry Association has decided to throw the show room doors open to the general public, and the Commercial Club has guaranteed to furnish a building suitable for housing 5,000 birds, and also will pay part of the operating expenses.

This arrangement has resulted from influence brought to bear by some of the leading poultrymen of that community, who state that the free admission will result in attracting thousands of people from their trade territory, which is supplied with numerous steam and interurban lines running in all directions.

There will be numerous educational features, including a series of chalk talks by Judge W. H. Card, secretary of the Rhode Island Club of America. Judge Card will pass on all of the Red classes and will be at the show room during the entire week to help any breeders who want information on mating and breeding that variety.

The Missouri State Poultry Association is the largest State Poultry Association in the world, numbering about 5,000 members, and it is the desire of the association to increase the membership to 7,500 before the first of December, for "in union there is strength" and the larger the membership, the more

good the association can do for poultry interests in this state. The annual dues are only fifty cents a year and the benefits include listing shows in Missouri for the special membership prizes, and numerous other features. Fred Crosby, Mountain Grove, is secretary-treasurer and will be glad to receive new or renewal memberships and answer any communications regarding th work of the association or any questions about the State Poultry Show.

* * *

The Western Connecticut Poultry Association, Inc., of Danbury, Conn., will hold its twentieth annual show in that city on November 25th, 26th and 27th, 1915. Every effort is being made to make this show a banner one and in all respects a fitting celebration of the associations twentieth anniversary. Many and valuable special prizes will be offered—both cups and cash—and exhibitors, large and small, are invited to compete. Premium lists will be mailed upon application to the secretary, H. G. Ward, Danbury, Conn.

* * *

THE ALLENTOWN FAIR

Dates for closing entries Friday, September 10 Exhibition opens Tuesday, September 21. This announcement of the great Allentown Fair Poultry Show is always pleasing to the thousands of poultry fanciers throughout the country.

Every department of this great show is carried on along the lines of advancement, giving to the poultrymen year after year a modern exhibition conducted in an up-to-the-minute manner. From the department of Eggs and Market Poultry, and throughout its various other classes, the prizes are most liberal, and the classification most complete. Show at Allentown.

* * *

NATIONAL SINGLE COMB WHITE LEGHORN CLUB

The National Single Comb White Leghorn Club is now preparing the new issue of its Annual Catalog and Year Book. Revised illustrations of the Club ideal male and female will be shown and everyone interested in White Leghorns should become a member and get this Year Book. The annual dues are one dollar per year with one dollar initiation fee to new members.

Valuable silver cups and beautiful ribbons are offered at State Meets where there are more than ten members in the state, and ribbons are offered at all shows complying with club conditions where three or more members compete.

The new catalog and year book is to be mailed about September 15, and those wishing to join this club should write either the president or secretary for application blank and become a member at once that they may be listed among the membership in the new book.

The club now numbers over seven hundred members and the membership campaign now going on bids fair to make the National Single-Comb White Leghorn Club the largest specialty club in the world. Eugene C. Smith, Pres., Aurora, Ill.; F O. Groesbeck, Sec'y, Hartford, Conn.

* * *

The Missouri State Poultry Association has secured the services of Judge W. H. Card, secretary of the Rhode Island Red Club of America, to place the awards on all Rhode Island Red classes at its twenty-third annual poultry show which will be held at Joplin, Mo., December 7th to 11th, 1915.

In anticipation of very large classes, the Association has offered in addition to the regular cash prizes, $50 in special prizes on all classes totaling 200 birds.

Judge Card will be at the show during the entire week and will be glad to give personal attention to mating and scoring the Reds. He also will give a number of his chalk talks in the lecture hall.

All of the other breeds will be judged by equally well known judges of national reputation.

Through the co-operation of the Commercial Club of Joplin, which has guaranteed a building suitable for cooping 5,000 birds, and also a portion of the operating expenses, the coming Missouri State Poultry Show will not charge admission to the show room or to any of the lectures or demonstrations.

* * *

The Seventh Annual Poultry Show of the Calcasieu Poultry Association will be held at Lake Charles, La., December 13th to 18th next.

This wide awake organization is planning big things for this year's exhibition, which will have a tendency to make this one of the South's largest exhibition. F. J. Marshall and C. P. Van Winkle have been engaged to handle the awards which, together with the fact that Mr. B. F. Hendricks is the Secretary, assures satisaction to exhibitor and visitor alike.

The consolidation of the Ancona Club and the Ancona Club of America, which is now known as the United Ancona Club of America, giving the Ancona breeders one of the Strongest specialty Clubs in the Country. This organization is officered by J. O. Somers, Bedford, Ohio, President; Geo. W. Cisco, Paterson, N. J., Vice President; R. W. Van Hoesen, Franklinville, N. Y., Secretary, and P. W. Logan, Woodbridge, N. J., Treasurer.

* * *

The Tri-State Poultry Association of Tennessee, Arkansas, and Mississippi announces the eighth annual renewal of their feature show at Memphis. The dates set are September 27th to October 2nd, as this poultry exhibition is to be held in connection with the Tri-State Fair and Exposition.

This show last year had the distinction of being the largest and most successful show in the south and by reason of quality and numbers, took rank with the Fall Shows of the country. Backed by an active Poultry Organization, the Tri-State Show at Memphis promises to be the banner show for 1915.

The cash prizes have been increased and the slogan of the premium list is "We pay our Prizes in Cash." The cash features like sweepstakes of $75.00 is open to breeders of souhtern states and is known as the "Southern States Sweepstakes." First prize money is paid to worthy specimens regardless of whether there is competition or not.

The judges are: E. C. Branch, Lee Summit, Missouri, and F. H. Shellenberger, of West Liberty, Iowa. These men by reputation and ability, guarantee the quality and competition at the Memphis Show.

For full information write: C. W. Merker, Secretary, P. O. Box 101, Memphis, or C. G. Boyer, President, 33 Porter Building, Memphis, Tenn.

* * *

Big Poultry Show to be held at the Coliseum at Peoria, Ill., January 3rd to 8th, inclusive, 1916.

There is every indication that the coming event that will be held under the auspices of Poultry Association—Peoria will be the biggest show ever attempted to be staged in the Coliseum. Present plans promise far greater results than any previous efforts on the part of the organization.

There is ample reason for these predic-

COLUMBIA GRAFONOLA "JEWEL" Other Models $17.50 to $500. $35

tions. The association is in a most flourishing condition. The membership is highly enthusiastic and all are pulling for one common end.

The comparison judging will be a feature and good judges will be chosen. Already the association has secured the services of D. E. Hale, of Chicago, and J. C. Johnson, of Springfield, Ill. Other judges will likely be selected in order that the ribbons may all be hung in one day. The management of this show will be in the hands of Henry Schwinn, of Peoria, Ill., who is president of the association. He is a good booster and is very much interested in the coming event. He is right on the job and will leave nothing unturned in the way of securing many cash prizes for exhibitors to compete for. C. P. Scott will officiate as secretary.

For further information write C. P. Scott, secretary, R. F. D., No. 36, Peoria, Illinois.

* * *

The Rhode Island Poultry Association have elected the following officers for the ensuing year: President, Daniel G. Lambert, R. I.; treasurer, Wm. H. Congdon, secretary, W. I. Brown. These with an able board of directors point to a successful show the coming winter. Show dates, November 30 to December 4, inclusive. Judges Lambert, Allen, Ingalls, Coffin, Braytar, Rogers, Evans, Benson, Shove and others to be selected.

This undoubtedly will be the largest and best show as yet held at Providence. With liberal premiums offered including both cash and silver cups, the exhibitor will think twice before he decides not to place Providence on his list of shows.

* * *

The 22nd annual exhibition of the Illinois State Poultry Association will be held at DeKalb, Illinois, January 3-8, 1916. Located in a good live town, surrounded by many of the best fanciers in the state; with a good hall and uniform cooping, a superintendent and secretary that will look after every comfort of the exhibitors and four of the best judges in the business in the persons of Hale, Halbach, Heyl and Johnston, the success of the show is assured.

All the officers of the show are experienced show men and know what it takes to please exhibitors. Courteous treatment and a fair deal to every one is their motto.

More cash specials will be offered at this show than ever offered before. You cannot afford to miss the Illinois State Show. Write to Theo. S. McCoy, secretary, Golconda, Ill., so that a premium list may be sent to you as soon as issued from the press.

The Illinois State Show is your show. If it is a success it is to your credit; if a failure it will be partly your blame. Be a booster and be sure to make a liberal entry.

* * *

Poultry raisers are to have a special prize offered them for an egg exhibit at Trenton Fair this year by the New Jersey State Poultry Association.

The organization has decided to give $100 in cash premiums for the best display and the interest of fanciers has been aroused by the announcement. This step by the association was enthusiastically endorsed by the members and is expected to bring together the largest egg show ever conducted in the State. No entry fee will be charged and the competition will be open to all.

Prof. V. G. Aubry, Extension Specialist of the Poultry Department of the New Jersey Experimental Station, will assist Superintendent Harvey E. Rogers in arranging the exhibit, and Professor Harry R. Lewis and Professor A. L. Clark, of the State Experimental Station, will be the judges.

Other details of this attractive offer will be found in the Premium List of Trenton Fair, which will be issued in a few weeks. Copies of the book may be obtained by those who send their names to the Fair offices at Trenton, N. J.

* * *

The annual catalog of the American Plymouth Rock Club reached all club members during the past month, and those who are not members have undoubtedly missed the best catalog as yet sent out by this world known Specialty Club. As usual it is rich in illustrations and contains valuable reading for all.

* * *

The Washington State Fair at North Yakima, Wash., is one of the large poultry exhibitions of the Pacific Coast, and the coming event, Sept. 20 to 25, 1915, is expected to eclipse all previous exhibitions. Mr. A. L. Meredith, secretary, North Yakima, will be pleased to mail premium list to all interested.

* * *

The next issue of the Buff Plymouth Rock Club Quarterly will be mailed by the secretary, W. S. Robinson, Fayette, Mo., shortly after August 1st. Every Buff Rock breeder should join the club and secure this valuable publication.

Mr. Robinson informs us that the national meeting will be held at San Francisco in connection with the poultry exhibition, November 18th to 28th.

* * *

The Wauseon Poultry and Pet Stock Association wishes to announce the dates of their second annual show to be held at Wauseon, Ohio, November 30 to December 4, 1915. The last year show was a decided success in every way and the outlook for the coming show will be greater. Judge Barrett's services have been retained and will place the awards. The Ohio State University will send an exhibit here, which will be interesting and educational to all. Be sure to write for a premium list. Send some birds and come yourself. Harry L. Merrill, secretary, Wauseon, Ohio.

* * *

The National Rose Comb Orpington Club will offer at all shows their special handsome silk ribbons to members in good standing at day of show. Ribbons will be displayed upon the coops during show or sticker representing same.

Membership fees $1.00, admitting member to all privileges of the club. National R. C. Orpington Club, E. M. Mengel, Sec'y, New Ringgold, Pa.

* * *

Supt. of Poultry J. Harry Richey, of the Stewartstown, Pa., Agricultural Association, writes us that the new poultry building will be ready for occupancy for the coming fair, September 8th to 10th. This building is modern in every respect and with its new equipment will be one of the finest poultry buildings in the Keystone State. Read their ad elsewhere in this issue of Everybodys and write Supt. Richey for premium list.

* * *

BROOKLYN N. Y., NOV. 16-20.

The Poultry Fanciers' Association of Long Island, Inc., in taking their show from Hempstead to Brooklyn do so with the end in mind of giving the breeders and the trade a better setting for their exhibits and making the show more accessible to visitors.

Our show in no respect is in competition with the great institutions across the river, on the contrary, our dates are just enough in advance to enable visitors to try out their birds with us in preparation for those shows. The judges in many classes are the same, and all are of equal prominence. Those engaged up to the present time are as follows: Lester Tompkins, Concord, Mass.; J. C. Punderford, Freneau, N. J.; W. J. Stanton, N. Y.; J. Harry Wolsieffer, Vineland, N. J.; Charles M. Smith, Sayville, N. Y., and H. P. Schwab.

* * *

The Monmouth Poultry Club will hold their eighth annual exhibition at Red Bank, N. J., in the new armory, November 23rd to 27th. Wm. G. Minnick, John Kriner, William Stanton, W. W. Kennedy and W. H. Tabor will place the ribbons. John Yeomans, Sec'y.

* * *

THE GREATER BUFFALO SHOW PLANS FOR BIG ENTRY

A surprisingly large number of inquiries for premium lists and entry blanks are pouring in at this early date, writes Secretary Jennings. The following judges already engaged include the best known in the country: Maurice F. Delano, J. W. Andrews, H. P. Schwab, M. L. Chapman, F. L. Platt, W. M. Anderson, Fred Kurmer, L. Rawnsley, J. H. Drevenstedt, Frank Conway, A. O. Schilling. Bantam Judges—W. M. Brown, Richard Oke, George Young.

Besides these, a number of other leading Canadian and United States judges will be added. Be sure to write for first edition of premium list which contains a full list of all the regular and special premiums which amount to over $11,000.00. Address, Wm. O. Jennings, Secretary, Electric Bldg., Buffalo, N. Y.

* * *

GET 'EM READY

What promises to be one of the big events in Chickendom this year, is the poultry show to be held in conjunction with the big American Royal Live Stock Show, in Convention Hall, Kansas City, Mo., from October 4-9.

This year promises to be the banner poultry exhibit staged at this great live stock show, owing to the more liberal premiums than heretofore, ideal time, location, and realization of the breeders what a winning at this show means, both from an advertising and financial point of view.

The judges this year will be V. O. Hobbs and R. F. Palmer. Premium lists are now ready and you may have one by writing the superintendent, Thos. W. Southard, 7 West 13th St., Kansas City, Mo.

* * *

The Ontario County Fair, to be held at Canandaigua, N. Y., September 16-18, is proving of great interest to the poultrymen of New York State. This will be the 76th Fair held by the above organization. Write Mr. Wm. S. Mills, Sec'y, for all information, as well as for premium list.

Everybody Reads Everybodys

It is such letters as the following which convince us that our efforts to publish an up-to-the-minute Poultry Magazine are appreciated:

Bradford, Penna.

I wish to acquaint you with where "Everybodys" will reach me during the next few months, as I would rather miss the "Garden" Show than one copy of your greatest Poultry Magazine on Earth. Just received the August issue, and have read it from cover to cover. Hats off to you all.

Yours very truly,
GEO. J. HANKS.

Note.—Mr. Hanks is state vice pres. of the Ancona Club and was the last year's secretary of the Williamsport, Pa., Poultry Show, is now connected with the Standard Oil Co., in extensive building operations.—J. T. H.

* * *

Wayland, Mass., July 21, 1915

We are looking forward with pleasure to your August issue and we know it will be good, for "Everybodys" has been good from the start. We helped send you five new names for subscriptions recently and shall probably have more for you shortly. I don't wonder that the circulation of your magazine is increasing. I should deem it worthy of such. Very truly yours,

Homestead Campine Farm,
C. A. PHIPPS.

* * *

Canton, Ohio, Aug. 26, 1915

Everybodys Poultry Magazine,

I regret exceedingly that I have not written you heretofore, expressing my pleasure in Everybodys.

I carefully went over the copy sent me and can only state that I was greatly impressed with same.

The editorials, articles and write-ups, if continued, will be of great assistance to all poultry fanciers.

Enclosed find my subscription for three years. Wishing you continued success, I am,

Very respectfully yours,
H. V. PAY.

(Note—Mr. Pay is president of the Canton, Ohio, Poultry Association and a fancier of the advanced type.)—J. T. H.

* * *

Greensboro, N. C., July 19, 1915

Gentlemen:—

Enclosed find 50c for a year's subscription, to begin with the August issue.

I thank you for the sample copy and wish to state that I consider Everybodys a valuable addition to my list of poultry publications; in fact, it is a Magazine that should appeal to everybody interested in poultry.

Wishing you all success, I remain,

Very truly yours,
CHAS. W. ORTON.

* * *

Fort Wayne, Ind., July 7, 1915

Everybodys Poultry Magazine:

Want to compliment you on the appearance and general make-up of Everybodys, especially your cover design for July issue.

Fraternally yours,
CHARLES G. PAPE.

* * *

Pleasant Valley, N. Y.
July 9th, 1915.

It certainly is a most excellent plan you have inaugurated, in keeping the Specialty Club Secretaries' addresses constantly before the public in the advertising columns, as it is a great convenience.

Taking it altogether, Everybodys Poultry Magazine is one of the best poultry Magazines published and every succeeding issue seems better than the last.

We certainly wish you much success.

Yours very truly,
MRS. W. P. MASTEN.

Charc-Oil Will Round Out and Tone Up Your Whole Flock

For Hens

For Cocks

Read This Letter

Charc-Oil is a Medicated Charcoal.

Everybody knows that pure charcoal is

A Wonderful Corrector

of all intestinal troubles. But Charc-Oil is better — it's pure hardwood charcoal medicated with antiseptic, soothing oils. It regulates digestion, corrects intestinal gases, heals, soothes. With it you can save your young chicks, keep the youngsters growing and vigorous, and the old birds in perfect condition through all seasons.

The most important ingredient of Charc-Oil is Pheno-Septol, an antiseptic and germ destroyer. There are also such costly and aromatic oils as Thymol, Eucalyptol, Menthol, Peppermint, etc. Charc-Oil counteracts the filth and poisons that fowl constantly pick up in grain scattered in litter, dust, etc., and in drinking from puddles, etc. Charc-Oil is the "Safety First" ingredient in modern poultry feeding. Your flock needs it — right now.

Riverdale Poultry Farm

Riverdale, N. J., July 16, 1915

King Remedy Co.
Rochester, N. Y.

Dear Sirs:—

We have given your **Charc-Oil** a thorough trial and have ordered our second lot.

We not only feed it in our dry mash to both chicks and adult fowls, but we keep it before the little chicks all the time, as we are convinced that with the warm weather and the tendency to easily contract the various bowel troubles that plenty of your **Charc-Oil** is the best preventative of baby chick disease which we know of.

We have at this writing five lots of incubator hatched chicks two weeks old from which we have not lost a chick. We feel confident **Charc-Oil** plays its part in this record.

Yours truly,
RIVERDALE POULTRY FARM.

Charc-Oil

both prevents and cures White Diarrhea, Indigestion, Constipation, etc. "Charc-Oil will make show birds out of culls." Nothing like it

For Birds of All Ages, Sizes and Conditions.

Packed in Three Grades:

XXX Grade (fine) granulated for young chicks and ducks.

XX Grade (medium) for half grown chicks.

X Grade (coarse) for adult fowls.

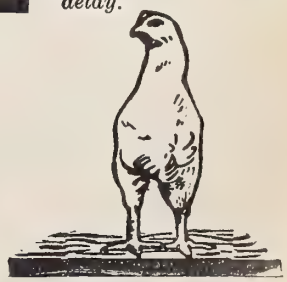
Our Free Service Bureau

is in charge of Prof. C. A. Rogers, former instructor and investigator in Poultry Husbandry at the New York State College of Agriculture. All questions pertaining to the use of Charc-Oil will be answered promptly and gladly. Write today. *Don't delay.*

For Chicks

Chicure
TRADE MARK
FOR YOUR CHICKS

Charc-Oil



For Growing Youngsters

is winning its way everywhere. It is our latest and best preparation, and there's nothing like it on the market. Clean, tasty and of a very pleasing odor. Poultrymen declare it to be the "missing link in chick raising," the "unequalled preparation for quick effective results", etc. So easy to use, too. No dosing or swabbing. All birds have a natural craving for it and they doctor themselves. It is sold on thirty days' trial — no risk. If after following the simple directions we give, the results do not prove our claims, we cancel the charge. *10 lb. fibre pails* of Charc-Oil, any grade, *$1.50. 25 lb. drums*, any grade, *$2.50* — all express or freight charges paid. Send for a pail or drum today — try it and see. The best health of your flock and greater profits are certainly worth the ordering of a little for trial.

KING REMEDY CO., 21 Elm Street, Rochester, N. Y.

A HELPING HAND

One Great Credit We Must Give To the Poultry Fraternity Is, That Where a Man Takes An Interest in Fine Feathers and Pure Breeds. the Women of His Household Are Usually There Also.—Estelle E. Collier.

THE men and women of the poultry world, who have the great interests of the organization at heart, are mostly of the middle class. They are workers with an ever present need for every dollar that can be had for the family purse. Luxuries usually spell sacrifice in some form and many poultry fanciers have been born into the organization because of the double advantage of having a fad that pays something toward the family income in the form of meat and eggs.

Much has been written of the American woman as the parasite of all women. Not the common woman of the street, but the woman, the respectable married woman in the home who, under the title of wife uses her privileges to parade her vanities before her little world at her husband's expense. The American woman of the middle class is a woman of comparative leisure. She can sit and gossip most of the day as even when doing her own work in the home, it leaves her several hours each day in which she does as she pleases. Her husband works his eight, nine or ten hours a day. This woman, the woman who has no children and whose husband makes a good living wage, is usually the one who wouldn't be bothered with fowls for the world. If her husband would have such things he must care for them himself and see to it that his wife's convenience and leisure are not interfered with because of them. Such men tire of wife and home very soon. These are the men who soon begin to look about after working hours for diversion that leads away from home. These are the wives that are ever to be seen going about with unattached females and feminine friends of a like nature, building up your purity squads, your civic pride clubs and your "Ladies' Aids." Not to say, understand, that these organizations have no good motherly souls among them. They have, but they are in the minority. Women past their prime make up such organizations and though these clubs have their uses they should not come before the needs of the home. The home comes before the State or Nation, else those would have no foundation.

It is the woman of large family interests that takes the real interest in the husband's poultry fancy. The woman who has many duties can always squeeze in one more when the need comes. It is asking too much to demand that a man make a perfect slave of his working hours on the tread-mill of existence to feed the vanity of some women.

Foreigners coming to this country bring their wives and families with deeply imbedded ideas of helping the familiy with their thrift, their economy, their last penny in time of need. In a few short years the wife, who, when she came, thought nothing of earning what she could in her little way, helping with a yard of chickens, a cow and often the drudgery of the neighborhood, soon began to compare her lot with that of her neighbors and complained that her clothes were not what others had, her house was not as fine as others enjoyed and her children not entertained as they should be. They must compete with their neighbors in the luxuries of life. Life in America has ceased to be one of struggle for a livelihood or for comfortable homes, but for homes and luxuries that will equal if not outshine those of the nearest neighbors. A man in this day and age does not look forward to supporting a wife and family or even in giving her a home as good as the home of her youth, but the question before him when he buys the marriage license is what neighborhood shall we live in and how far will my income go toward paying for the luxuries we shall need if we live there.

It seems to me that the woman, married or single, who does not do some definite thing toward helping her husband or father to lessen this load that hangs like a pall over the wage earner is no less a parasite than the despised pauper who spent his earnings as fast as he made it and failed to provide for his old age. Many a man works to the day of his death and leaves a wife dependent on a family of luxury depraved children who have been led all their lives to think that life owed them one round of entertainment to be paid for by the head of the house.

One great credit we must give to the poultry fraternity, and that is where a man takes an interest in fine feathers and pure breeds the women of his household are usually there. It is a democratic organization. Men will not keep poultry nor follow the fancy long if their wives are not interested. The demand on a woman's time is not so great that it becomes a hardship unless the care of children, too small to leave unattended, keeps her from it.

How often do you see, however, the woman who has

all sorts of time to devote to preparations for entertaining the "Ladies' Aid" or her little club of eight or ten members, complain that the poultry in the back yard is such a trial to her patience. How often such women as these call the neighbor's attention to the fact that green things in the market are so cheap that it doesn't pay to raise things in the garden. This is the sort of woman who runs her husband in debt that her children may dress a little better than the neighbor's child and buys an automobile before she wants to own a home.

A man has a right to his love of fowls as well as his wife's help in caring for them. It is a creditable ambition for a man to want some home interests that do not comprise solely of bills to pay. It is a great satisfaction to a man to sit at his table and know that the meat and vegetables thereon are of his making, that no bill will be handed him. A man's garden, his flowers and his poultry make up that thing we call charm in the home surroundings, just as much as does the presence of well cared for children. The home without them usually sees the husband ready to be entertained by his gentlemen friends down town. It is about time that we women woke up to the fact that we and our children represent a steady PAY OUT and the least we can do toward the upkeep of the home and the lessening of the burden laid on the shoulders of the bread winner the better for all concerned. Even if a woman's duty to her husband does not include the attention of his fowls that he desires she can at least help him to care for them when necessary and show enough interest in the work to help keep up his enthusiasm. It is one of the things that will grow with practice. I know whereof I speak, as I had to develop the desire to help care for poultry when it would have been more to my taste to have chucked the whole business and bought my roast in market. It is one of the things that pays to cultivate. The more you strive with the problem, the better you attend to the mere business of doing what you can to help the poultry make a good showing, the greater will be the returns. What man or woman can hesitate to lend a hand when by doing so the return is visible on the breakfast table or for Sunday dinner? Incidentally the holidays become real festivities when the meat bill is of no consequence.

I have known a number of women who thought they had done their full duty as married women, who prepared a little breakfast for their husbands, swept and dusted a little two by four home and sat down to read or talk after they had gathered the laundry for the wash that was to be called for each week. These women would hunt up the coolest corner in summer and the warmest in winter in which to lounge during the greater part of the day if there were no great bargains to be had in the department stores. These same women would sit and complain that their husbands had such poor taste as to work in soot grimy shops that caused them to come home looking so black and uncomfortable on hot days. They were really ashamed that husbands like those belonged to the family.

The fact is that the great majority of poultry raisers, those whose hearts are bound up in the development of pure breds are not men and women of wealth. They are of that army of workers known as the great middle class. In this class are found those whose wives are the greatest sort of help and those also, who by their dress and manners, their presumptuous plans for the education and entertainment of their children you would suppose was backed by an income of thousands of dollars per year.

The middle class is the backbone of the nation. On it rests the feeding, the clothing and the sheltering of all the people in the United States as well as parts of the other world. It is a task of limitless magnitude. We of the common middle class send our children to the factories, the shops, the employed ranks in all the city life and populate the farms. We and our labor make wealth and luxury possible and our men must tread the grind of an existence, sometimes more than eight hours a day until death, to make it possible for these comforts to go on. Does it not then, when we have so much idle time to spare, behoove us to do somewhat toward keping up an enthusiasm that will take the mind off this eternal grind? A man's life is no snap as long as he must be a bread winner.

On the other hand. If a woman has her hands full with her household work. If she is sending a bunch of youngsters to school and has a few left at home to care for, if she has to do her own cooking, mending, sewing and cleaning, it is asking a little too much to have her do work that takes her outside the house when little ones must be kept where it is warm. Many a man who does not have to leave his home till nine or ten in the morning and can, if he will, get home by six, expects his wife to do all her sewing, cooking, cleaning and work the garden and attend the chickens besides. He very graciously looks on and commends or talks disparagingly of her work. Such men have no business with a love of the fancy or anything else. They want fine feathers and pure bred birds for show and not for any love of the fowls. These men are they who would bring a crowd of friends in to see what a fine pen of chickens they possessed and go to the shows with them while the work at home goes on just the same.

I have in mind a particular case where the woman worked every minute of her waking days for about twenty years, producing prize winners for the poultry shows. Year after year she stayed at home because the income didn't justify any more outlay than was actually necessary. Her husband worked in some shops that kept him pretty busy. When, however, the income increased and the poultry produced enough to allow the man to lay off work and attend poultry shows with his stock, the wife still stayed at home and raised more fancy birds that he might flaunt blue ribbons and "treat the boys" at the show. Many times in the latter years I have seen her with a little ten cent bag of candy like a pleased child showing the birds and munching the candy, enjoying the only outing of weeks. Tho she was a bright woman, an occasional trip to a poultry meeting was the only recreation she knew for years, yet he was to be seen at show after show paying his hotel bill like a lord and going out with the men. Is it any wonder a wife like this finally woke up and left to support herself? There is nothing in helping a man like this to keep up an enthusiasm for pure breds. Such a man needs first to learn how to make his wife a partner in his joys as well as share his labors.

To most women it is a pleasure to care for poultry and if it were not for snobbish women, who think it plebian to have such things around more would take a real interest in the work. There is nothing disgusting about the work, if the proper houses are built and kept clean. Of course few women would enter a miserable dirty house that hens find too filthy for their health. It doesn't take more than ten minutes to keep an ordinary poultry house clean and very little space is required in the garden to raise enough kale to keep a small flock in green food all winter.

Let me say here that green food in winter is what gives us our eggs and the lack of it is what gives us eggs on the market at fifty cents per dozen and hard to get at that. Hens will lay in spring because the green food is plentiful. When hens come home from the winter poultry shows they begin to lay at once. Why? Because at the show some one always throws cabbage into the coops for the hens to pick at and the eggs start to come.

Many women take a great interest in their garden, but despise poultry. We find that the young chix until half grown are the greatest help to the garden we know, saving our plants from the bugs and worms.

If you stop to consider the comparative values of garden and poultry pens, however, you would find that before six months are over the poultry pays the best. Even if your garden of two or three hundred feet is ruined by the chix, if it saves those chix during a hot

THE COUNTRY BOY'S CREED

I believe that the Country which God made is more beautiful than the City which man made; that life out-of-doors and in touch with the earth is the natural life of man. I believe that work is work wherever we find it, but that work with Nature is more inspiring than work with the most intricate machinery. I believe that the dignity of labor depends not on what you do, but on how you do it; that opportunity comes to a boy on the farm as often as to a boy in the city; that life is larger and freer and happier on the farm than in the town; that my success depends not upon my location, but upon myself—not upon my dreams, but upon what I actually do, not upon luck, but upon pluck; I believe in working when you work—and in playing when you play and in giving and demanding a square deal in every act of life.

—Edwin Osgood Grover.

and dry summer your labor in that garden is well paid. It takes a mighty small flock to compete in money values with the very finest garden big enough to feed them. The best birds brought into the show room are those that have had a little corner of the garden to forage in. "Stolen fruits are sweetest," and chix thrive on the stolen sweets from the kitchen garden.

The proudest woman to be seen at the fall poultry shows is the one who overcame her distaste for poultry and helped attend them when conditioning them for the show. After the first blue ribbons are won no woman need be begged to help. But the point is that it is a woman's duty to help a man in his ambition for raising fowls. if that be his pleasure, as surely as it is her duty to see that his bed is made.

So many women think first of what their neighbors will say if they undertake a task that has to do with anything that borders on manual labor. They feel that they are falling from caste to work more than is absolutely necessary. Women of the right sort want to help in all ways they may and the sooner sensible women deride the lazy woman the sooner we will breed a race of girls and men that have something to do besides primp and stand about on dress parade. The most useless piece of humanity in the world is she who thinks more of her own convenience than of her husband's pleasure. Women with large families do not get the chance to consider their own leisure. Their time is always taken up with countless tasks as exacting as any husband could wish for, but for the woman who has only herself and husband to care for there is no excuse for not giving a helping hand to the husband who finds his pleasure in the show room and the poultry yard.

FEEDING FOR EGGS IN WINTER

Successful Feeding For Egg Production Necessitates a Clear Understanding of the Principles of Nutrition.—H. R. Lewis

NUTRITION is one of the most vital processes of all life. It is the process by which life is maintained and growth is promoted. In the case of birds it controls the wearing away and the building up of body tissue, it converts food into heat and energy into the products which are produced outside of the body, as the egg. The process of nutrition is carried on through minute particles or materials in feeds, which are called nutrients. These nutrients are transported to the different parts of the body and after being broken down in the process of digestion go directly into the making of solids and liquids of the body. The nutrients which should be of special interest to the poultryman are five in number. A knowledge of their nature, functions and the most economical source from which to obtain them is necessary if an efficient and economical ration is to be mixed. These nutrients are, protein, fat, carbo-hydrates, ash or mineral and water. With the exception of the carbo-hydrates these materials are all found in the body of the birds and are essential to their life and development. The following brief discussion of the nature and function of these materials will be valuable.

THE NATURE AND FUNCTION OF FOOD NUTRIENTS

The protein nutrients are among the most important in feeding for eggs. They contain a considerable quantity of nitrogen, on which account they are rather expensive to buy and are hard to raise at home. Common examples of protein compounds are the albumen or white of the egg, lean meat and gristle. The feathers contain much protein. Protein when fed to birds has three distinct functions to perform. Its most necessary use is in the production of body tissue. This is seen in the case of growing animals, as young chicks. It furnishes material for the repair and building up of waste or broken down tissue in the adult. Much protein is used in the formation of feathers, claws and other similar body parts. The second great use for protein is in the production of some product outside of the body, as eggs. The egg is largely water, but when only its dry matter is considered one-third is protein or a nitrogenous compound. The third function of protein is that all not used for the first two purposes is not wasted and thrown off as excreta, but it is burned in the body like carbo-hydrates and furnishes material for the formation of fat. Protein is indispensable in any ration for laying hens for its place cannot be taken by either of the other nutrients, hence great care should be used to see that it is supplied in abundance. A laying ration is satisfactory or not, depending upon the amount and nature of its protein.

Fat is familiar to all. It exists in the form of oil in seeds, in vegetable products and in animal tissue. Most vegetable feeds are rather low in fat content, there are a few, however, such as oil meal, cottonseed and others which are characterized by large amounts of fat. Fat, as it is found in the bird's body, acts as a reserve food supply and filling up the spaces between the organs as a cushion or protecting layer. Much fat is found under the skin where it gives the animal a plump, full appearance. It is this quality of fat which is desired in the plump broiler or roaster, which is being finished for market. The functions of fat are so similar to those of carbo-hydrates that they can be considered together.

The third group of nutrients mentioned was carbo-hydrates. This group contains the starches, sugars and fibres. Carbo-hydrates are found in abundance in all cereals and they can be produced by the poultryman in large quantities on his home farm; when purchased they can be secured at a reasonable price. This group of nutrients, together with fat, is esentially energy formers. Their functions are three-fold. First, they are burned in the body during the processes of digestion and give off heat, which keeps the body warm. Secondly, the heat energy so produced is developed into energy to enable the bird to move about; lastly, all of these nutrients are so changed over that they can be stored up in the body in the form of reserve heat or fat. The only real difference between fat and the carbo-hydrates is the fact

THE LARGE SELF-FEEDING DRY MASH HOPPER

This is the most economical and efficient method of feeding the laying flock.

that the former is much more efficient, a smaller amount of fat giving a greater amount of energy value.

The ash content of the body is easily appreciated in the bony framework or skeleton. Ash exists in very small quantities in other parts of the body. Ash is very essential in feeding young growing birds, as it is required in large quantities to make suitable bone development. Laying hens require quantities to make the shell of the egg. Ash is very useful in increasing the efficiency of any ration for the presence of same seems to increase the amounts of the other nutrients assimilated. Phosphoric acid and lime are the two chief kinds of ash needed, the former to make bone and increase assimilation, while the latter is used almost exclusively for shell formation.

With many poultry feeders the great need for an abundant supply of water is very frequently overlooked. Water, while not a true nutrient, is nevertheless so intimately associated with the processes of nutrition that it should be considered here. Water has four definite functions to perform in the bird's body: (1) It gives the body a plump, full appearance by filling up the cells and distending the tissue. (2) It is a material aid to digestion by dissolving the particles of food material and reducing them to smaller size so that they can more readily be acted upon by the digestive fluids. (3) It is a valuable transporting agent, carrying the digested food is material to all parts of the body. It is a material aid to assimilation by aiding diffusion. (4) The body temperature of the bird is relatively high and water acts as a regulator, maintaining a uniform constant temperature. From a study of these uses it is very apparent why a fresh supply of clean, pure water should be kept before the flock all of the time and also why some succulent material should be given in addition.

These nutrients constitute fuel, which is given to keep the bird's body alive and active. Just as the stove needs fuel to make it burn and give off heat so the animal's body needs fuel to keep it running. This food material, in the case of the hen, has an additional function to perform, namely, the supplying of raw material from which the egg is manufactured. The bird's body is really a machine taking in a raw or unfinished product and turning out a finished product for human food consumption in the form of meat and eggs. In order to better see what raw materials are most necessary, let us study for a moment the nature of the machine, its product and the feed which it consumes.

THE RELATION BETWEEN FEED AND PRODUCT

In the feeding of all domestic animals there must be a close relation between the nutrients in the feed and the character or composition of the resulting product. For instance product which contains much protein and water, as the egg, can only be produced in goodly number when the feed is rich in these ingredients. That, in a few words is the reason why the average farm flock throughout the United States produces but few eggs at any season except the natural breeding season in the spring. The farmer has plenty of corn, which he raises at home and he feeds it to the exclusion of everything else. Corn is essentially a fat and carbo-hydrate feed and hence does not provide the protein necessary to make eggs. The following figures shows the relation which exists between the composition of the feed, the bird's body and her product, eggs:

	Water	Protein	Fat	Carbo-Hydrates	Ash
FEEDS					
Corn	10.6	10.3	5.0	72.6	1.5
Meat Scrap	10.7	60.0	20.0	....	5.0
Green Clover	70.0	5.0	1.0	20.0	2.0
BIRD'S BODY					
Hen	55.0	20.0	19.0	....	4.0
HER PRODUCT					
Fresh Egg	66.0	13.0	9.0	....	12.00

Eggs, which are the product desired, contain much water, by the figures over two thirds of a dozen eggs are water. Green Clover, or any other palatable green feed, would then be selected to make up a part of her diet. Taking out the water from eggs the remaining portion would be about one-third protein and one-third ash, with a smaller amount of fat. To supply these materials one would naturally select meat scrap for it is high in both protein and fat and the protein is especially palatable and easily digested. This comparison shows the necessity of feeding layers much mineral feed. Ground oyster shell contains a high per centage of lime and is largely used for making the shell of the egg. Phosphoric acid can best be secured from bone products. Dry ground bone contains about 25 per cent of protein and in addition over 20 per cent of phosphoric acid, the presence of which is a great benefit to the ration. Fish scrap, if of good quality, can be economically used as it contains much protein and valuable bone products including phosphoric acid. From the above figures it will be seen that corn, like most other cereal crops, can be used to provide the carbo-hydrate or heat forming nutrients. The bird's body is similar in many respects in composition to the egg, there being over 50 per cent of water present, much protein and considerable fat. The maintenance requirements for a flock of laying hens calls for a ration containing much the same materials as are required for egg production but not in the same quantity.

In studying these figures to get their true significance, it must be appreciated that any animal will utilize its food first to maintain its own body. It must be kept warm and must use food to enable it to move around in search of more food and it must be supplied with nitrogen enough to repair its waste in body tissue, which waste is caused by the processes of life in wearing down and building up tissue. Feed must be supplied in addition to the requirements for maintenance, if any eggs are to be produced. The greater egg production which is secured will mean a heavier consumption of feed. One of the best indications of the laying condition of a flock of poultry is to see them consuming increasingly larger quantities of mash. This is especially true with pullets

A general view of one half the Sunswick plant. Notice the orderly arrangement and cleanliness evidenced. This view taken in winter, does not show the foliage on tree and bushes, affording the desired shade and protection.

which are just approaching maturity. An increased food consumption means that it will be followed shortly with an increased egg yield. If we are to get eggs we must provide the material to make eggs and this may be said to be the only secret connected with the feeding for egg production. To the student of birds and their habits it does not remain a secret long.

COMMON SOURCE OF FOOD NUTRIENTS

The following are some of the more common sources of these five important food nutrients. The economy with which they can be purchased and the amount of indigestible food material present will determine which to use.

TABLE OF FEEDING STUFFS

Protein—Meat Scrap, Ground Bone, Fish Scrap, Skim Milk, Milk Albumen, Linseed Meal, Gluten Meal, Soy Bean Meal.

Fat—Meat Scrap, Cottonseed Meal., Sunflower Seed, Soy Bean Meal.

Carbo-Hydrates—Corn, Wheat, Oats, Buckwheat, Barley, Alfalfa Hay, Clover Hay.

Ash.—Oyster Shell, Ground Bone, Meat Scrap, Fish Scrap, Phosphate Rock, Wheat Bran.

Water.—Lawn Clippings, Green Alfalfa, Green Clover, Pasture Grass, Mangel Beets, Cabbage, Lettuce, Sprouted Oats.

There are a great many desirable ingredients not mentioned above, but those given are the most common and are all which are needed from which to compound a very satisfactory ration. It will be noted that the protein carriers, from an animal source are also high in ash, especially phosphoric acid. This fact should be especially considered when selecting the different products.

The other half of the Sunswick panorama. Note the excellent construction of the buildings and the business-like appearance of things in general.

COMPOUNDING THE RATION

When compounding the ration or when determining upon the kind and amount of each ingredient to use, there are certain fundamental facts to consider which have reference to the efficiency of the mixture as a whole.

(1 The ration, when mixed, must contain sufficient food nutrients. That is, the flock when fed the ration should be able to get from it all the food material which they need for maintenance as well as production. The flock must not be starved, as it were, for such a practice would result in a great reduction in egg yield, due to the birds using what food they did get to keep their body up to normal weight and in proper working order and there would be little left for egg production. The danger of this happening is very common in the fall when pullets are coming into production or when hens which have been through the moult are again beginning to increase the egg yield. If more eggs are to be laid, more feed must first be given and eaten by the birds.

(2) The nutrients in the ration must be in proper proportion for the purpose desired. If the egg production is the object, a considerable quantity of protein must be available, as shown by the previous table. A so-called narrow ration will result, it being expressed by a ratio of one part of protein to four parts of carbo-hydrates and fat. If on the other hand the ration was to be used to feed roasters for market a larger proportion of fat forming nutrients would be necessary and the ratio would read to every part of protein seven to eight parts of the fat-forming materials, fat and carbo-hydrates. It is important, then, to select such feeds that the relation between the two groups of nutrients will be adapted to the purpose desired.

(3) The ratio as mixed must be palatable. It must be to the liking of the birds or they will not readily consume large quantities of it. Palatability increases the digestibility of any feed. In order to insure palatability the ration must have considerable variety, that it, it must be made up from a number of different ingredients. Wheat by itself is a balanced ration as far as the nutrients which it contains is concerned, but wheat alone would not make a suitable ration for laying hens during the winter period.

(4) The ration as compounded mus be economical and must be easily mixed and stored. The cheapest feed is not always the most economical. Meat Scrap of a high grade, containing about 50 per cent. of protein can always be purchased for $50 a ton and is much more economical than a low grade scrap, which contains 35 per cent. of protein and for which one must pay $40 a ton. The latter is cheaper, but not so economical. So it is with soggy or mouldy corn, it can be purchased for less per 100 pounds, but its feeding value is greatly reduced.

The ingredients used should be of a nature that a large quantity can be mixed at one time and stored in barrels or bins for use each day. This periodic mixing reduces the labor of feeding and it insures that the rations shall be each day of the same composition.

(5) The last and one of the most essential considerations is that the ration as mixed shall be correctly fed. Regularity in poultry feeding should never be neglected. The birds become accustomed to receiving their feed at a given hour and place and when the time comes they are there to receive it. If the feeder is not on hand a long period of idleness results. After having mixed the best possible ration the feeder must use intelligence and study in making such variations as are necessary for breed, season and age of birds. With these considerations as to the nutrients, their uses and sources, we are ready to consider a definite ration and feeding practice.

A SIMPLE RATION FOR WINTER FEEDING

After a careful study of existing methods of feeding laying hens, the majority of commercial poultry plants and most experiment stations have gradually come to the belief that a dry mash kept before the birds in large hoppers, with cracked grains fed morning and night in deep litter on the floor of the house, is the best practice. It is true that this system requires the least labor which is consistent with the greatest efficiency and proper personal attention on the part of the feeder.

The following is the New Jersey Laying Ration and method of feeding. Our station has for years been making a careful study of the best rations and methods of feeding for egg production, with the result that we offer the following ration as nearly an ideal standard as it is

possible to secure. Any variation must be made at the discretion of the feeder as determined by local conditions.

THE NEW JERSEY LAYING RATION

The following dry mash is kept before the birds all of the time in self feeding hoppers:

Ingredients	Weight	Approximate Cost
Wheat Bran	200 pounds	$3.20
Wheat Middlings	200 pounds	3.50
Ground Oats	100 pounds	1.65
Corn Meal	100 pounds	1.65
Gluten Meal	100 pounds	1.70
Cut Alfalfa	100 pounds	1.60
H. G. Meat Scrap	200 pounds	6.00
Total	1000	$19.20

The above dry mash is especially adapted to the feeding of Leghorns. Where heavier breeds are kept they will tend to take on flesh if special precautions are not taken. Under these conditions the hopper should be left open only during the afternoon and closed during the morning to compel them to take more exercise.

When the above mash is used during the summer oil meal is substituted for gluten during the moult and depending upon the amount of range which the flock has access to the concentrated materials are reduced in proportion.

As supplemental to this mash the following scratching ration of whole grains are fed morning and night in very deep litter on the floor of the house. Its primary object, aside from its nutritive value, is to induce exercise and keep the individuals of the flock in good health thereby. About five pounds of the scratch ration is fed to each 100 birds in the morning at 8 o'clock and about 10 pounds to each 100 birds at 4 o'clock in the afternoon:

SCRATCH RATION

Ingredients	Weight	Approximate Cost
Cracked Corn	200 pounds	$3.30
Wheat	200 pounds	4.40
Oats	100 pounds	1.93
Barley	100 pounds	2.00
Buckwheat	100 pounds	2.00
Total	700 pounds	$13.36

A good feeder will occasionally go among his flock at night and handle them and after feeling of the crop determine whether he is feeding them the right amount or not.

In addition to the above ration some succulent material, preferably mangel beets or sprouted oats, should be fed at noon, all they will eat up in 20 minutes. Fresh water grit and shell should be kept before them all the time.

There are no secrets in getting winter eggs. Give the above rations a try. Follow them carefully and above all study the birds.

THE FALL CLEANING OF THE POULTRY PLANT

Just Before the Winter Sets In is the Best Time To Clean the Poultry Plant Systematically

Willard C. Thompson.

AUTUMN is coming with its shedding leaves and shorter days, reminding us that Nature is getting ready to bring on the winter season once more. To the poultry keeper this means that cold days and bare yards call the poultry flocks into the winter houses, call the maturing pullets from the ranges over which they have been roaming during the warm summer months, and call the poultryman's attention loudly to the places in which those birds are to pass the months of winter confinement. Because of the fact that the greater part of all poultry flocks are to be kept in laying houses very closely confined during cold winter months it is especially necessary that all such houses be thoroughly and sanitarily cleaned before the birds are moved into them. Then, also, such a cleaning is made necessary because during the hot summer months while the birds have been out on pasture or range little careful attention has been given to the sanitation of the houses themselves. Dirt and cobwebs have undoubtedly accumulated, furnishing breeding places for not only lice and red mites, but also disease germs. All things of this order should be removed from the house which is to be the winter home of many birds.

The real reason why the whole poultry plant and more particularly the laying houses should be thoroughly cleaned in the fall of the year is to place the plant and the houses in such condition that they will furnish the most healthful environment for our birds, offer no causes for set-backs in development and body activities, and tend to incite greater winter egg production because of increased health and vigor among the layers kept in them. Laying birds are the result of careful breeding, care and management through many years. Today more than ever it is necessary to properly protect these layers and surround them with environmental conditions that will preserve their health and keep up their productive capacity.

The big fall cleaning of the poultry houses must be a big cleaning. It must be more thorough than the weekly or monthly cleanings that have been, or should have been, made during the year. Get down to the bottom of everything. In order to do this in as short a time as possible it will be found very helpful to follow some definite system plan of cleaning. The object of this big clean-up is not only to remove manure and dirt but to take out with them lice and other injurious parasites that may be lurking there in waiting for the birds that will be at close range during the cold months. Disease germs must be removed from their breeding places and not left to work against the health and vigor of the flock. First of all then, make your standard thorough when starting in to prepare the laying houses for their winter occupants.

WHEN TO CLEAN THE HOUSES

In general it is best to clean the laying houses and other poultry houses on the plant any time during the latter days of October and early days of November. Of course, much will depend upon the poultryman's plans for bringing his birds into their winter quarters. If he plans to bring them in earlier than the middle of November, he will want to clean the houses before this time, but if he plans to bring them in at about the regular time the above dates will undoubtedly be convenient for him. His other work about the farm or plant will also influence the time of the fall at which the big cleaning is to be made. It is a good plan to put the birds in the houses soon after they are cleaned, for then the houses are fresh and clean and will be more apt to receive the careful attention needed daily to keep them in good condition. There is a whole lot in this last statement. When the birds are in the houses, at least for the greater share of the time, the care-taker is bound to notice the little things that go toward making a poultry house sanitary and clean than when the birds are on the ranges and in the houses for only a short time during the day. Set aside a day just before you plan to sort out the pullets and bring the old birds into winter quarters for the purpose of cleaning up the houses.

The day on which the cleaning is done makes quite a difference in the general results obtained. A bright, sun-shiny day should be chosen for this work. Do not put it off until a dark rainy day comes along. Poultry house-cleaning is not a rainy day job. On such days there is too much moisture in the air to allow of getting all the dirt and dust removed from the remote corners of the houses all of which will be easily removed when dry and powdery. On damp, dark days the house cannot dry out sufficiently and quickly enough to insure healthful conditions. On cleaning days the birds must be kept out of the house for the entire day, or until the job is done and dried. This should only be done when it is dry, bright and pleasant outside. The sunny day keeps things dry and helps wonderfully in the sanitation of the house.

Sunlight is one of Nature's greatest disease germ destroyers.

Begin early in the morning. Cleaning is a morning job. It is best to begin in the morning with a house so must be removed from their breeding places and not that any disinfectants that may be applied to whitewashes will have sufficient time to thoroughly dry before the birds are turned back into the houses for the night, for there are usually some birds in the houses the year around, especially at nights. Beginning early in the morning gets the houses into such condition that they can be re-littered and fixed up before night-fall.

SYSTEMATIC STEPS IN HOUSE CLEANING

1. Put the birds in the yards or other enclosures for the day, or until the house has been cleaned and is ready for their return. This prevents exciting the birds and thus affecting their egg production. It also makes the work of the man much easier, as there will be no birds under foot and none to watch. Nests or boxes can be placed in the yards where the birds are confined in which they can lay their eggs for the day. There should nothing remain in the houses which will in any way hinder the work of cleaning the houses.

2. Remove all the movable fixtures from the house. This includes all movable nests, such as trap-nests and other nests made by the use of frames on board platforms, food hoppers, grit and shell hoppers, feeders, and any other parts of the interior of the house which can be taken down and moved. These fixtures should be placed in the yard where the sun can beat down upon them during the day. It is a good plan to wash them all thoroughly, after having emptied out any food or litter that they may have contained, with a five per cent. solution of some good coal-tar disinfectant, such as Cresonol or Zenoleum. After they have been emptied and washed they should be left in the sun for the rest of the day. The disinfectant, along with the sun will kill any disease germs that may be present and will make the hoppers and nests sweet and clean. As the birds come intimately in contact with the movable fixtures of a house many times during the winter, this part of the work is a very essential feature. It takes but a moment's time to do this part of the work.

A bright, sunny house ready for the winter occupants. Note the fresh coat of whitewash and the deep, clean litter, as wll as the clean hoppers and nests.

3. Now go back into the house and begin to remove the old litter and dirt. If there are fixed nests in the house the old litter from them should be carefully cleaned out and the nests brushed out. When it comes to this part of the work the great advantage of movable nests will be realized more fully than ever before. It is very important that all nests, of whatever type they may be, be thoroughly cleaned out. Lice accumulate very rapidly in such places, and spread from bird to bird very quickly as each enters the nest. Proper care at this point of the work does much toward cutting down the infestations of body lice and mites. The dropping boards should be cleaned thoroughly next. If pits are used beneath the perches instead of dropping boards, the work of cleaning out the manure will be somewhat more. All litter in the pit, or drying material, should be taken out and fresh material replaced at the end of the day. Leave nothing that is filthy or dirty in the house at this fall cleaning. Before removing the litter from the floor, the walls and ceiling must be carefully swept. Use an old broom for this purpose. See that all the cob-webs are brushed down from the corners, particularly between the roof-rafters, where there are usually many of them. It does not take very much time to sweep the whole interior of the house and the result is very satisfactory. The muslin curtains in the front of the house should be lowered and carefully swept. There is a two-fold purpose in very carefully cleaning these curtains. First, when they are fastened up for the greater part of the year there is nothing to prevent much dust and filth accumulating on them. These materials are splendid environments for germs and parasites, where they can grow unmolested. Such breeding places are removed when the curtains are swept. Secondly, the dirt and filth clog up the air spaces between the threads of the cloth and interfere with the ventilation through the curtains when they are lowered on cold, stormy days. When this is done the litter and dirt in the house is all on the floor and is ready to be removed. Where cement or board floors are used this is very simple, as everything can be scraped down to the floor itself. When dirt floors are used there is a little more work required. Clean off the litter and dust and then dig out about three inches of the dirt floor, replacing the same with sandy dirt, if possible. Removing this much of the dirt floor will practically insure sanitation. After the old litter and manure and dirt is removed, the house is next ready for the disinfecting process.

4. Many of our largest poultrymen find it practicable to whitewash their houses twice per year, spring and fall. This whitewashing is of great value from several standpoints. In the first place, it improves the appearance of the houses, covering them with an interior coat of white. The poultry business is much a matter of small details and attention to small points that collectively make or break the business. In the second place, the whitewash formula, as given below, does much toward killing any bacteria that may be present in the cracks and out-of-the way places which the whitewash covers. Such bacteria as cause avian tuberculosis, roup, chicken-pox and other contagious troubles will be destroyed, at least to a very great extent. The coal-tar disinfectant which is added does this work. Then, in the third place, the kerosene in the mixture kills red mites, those minute enemies of the laying fowls which live in cracks and crevices of the houses during the days, waiting until the birds are on the perches at night before making their attacks.

The formula which has been used for a number of years with excellent results is as follows:

5 parts cream of lime.
1 part kerosene.
½ part any good coal-tar disinfectant, as Cresonol.
6½ parts water.

By cream of lime is meant the fresh stone lime, slaked to the consistency of thick cream. Best results will be obtained if boiling water is poured over the stone lime and the tub covered for a minute or two after the water is poured on. This keeps the steam confined and hastens the process of slaking, thus making a finer quality of cream of lime and one which will not be lumpy and need careful straining. After sufficient water has been added to make the lime creamy, measure out the desired quantity and add the kerosene and disinfectant as per formula. Add a handful of salt to each pail full. If the mixture is not very fine it is well to strain it through a sieve before putting it in the pump.

The best way in which to apply this mixture is with a force pump, any type being satisfactory, as long as it distributes a fine spray with considerable force and fairly evenly. With a force pump it is possible to get the whitewash into the cracks between the boards and into the corners and other places that are apt to be slighted

when the brush is used. In other words, the force pump more thoroughly covers the interior of the house. If such a pump is not accessible a wide whitewash brush can be used. When using a brush be very careful to cover all the parts of the house and hit the cracks especially hard, for it is in them that the enemies lurk.

Be careful not to get the whitewash upon the muslin curtains as it will prevent the ventilation that the removal of the dirt would make possible when the curtains are closed. A very easy way to prevent getting the whitewash upon the curtains is to fasten old gunny sacks over the curtains during the whitewashing process.

It will take but two or three hours to dry the greater part of this whitewash.

It will do no harm to get considerable of it on the perches and dropping boards, also the floors. It is disinfectant and clean.

5. The whitewashing will probably be completed by noon. Along in the afternoon the movable fixtures and utensils can be returned to the house, all of which should be clean and dry. Fresh dry mash should be placed in the hoppers and also fresh supplies of water, stone and shell. The nests should be fixed up with clean litter.

The winter boarders have arrived, and liking the surroundings, have promised to return good payments for their care and food.

6. There is really an art to making a good nest. It should be done particularly carefully as winter sets in, for we want the cleanest of eggs, and clean eggs cannot come from dirty nests. Put the litter into the nest and fill the corners full first. Then the sides, leaving the center until last. This plan makes a nest from which the eggs cannot roll. Some poultrymen like to put a sod of moist earth into the bottom of the nests, filling the corners with dirt. This makes the nests a little more moist. This however, is not so necessary until time comes in the spring to put the setting hens at work.

7. The last step is to put six or eight inches of good litter over the floor. Fresh, clean litter is a real joy to the birds. It insures exercise and builds up the health of the flocks.

8. Turn the birds back into the houses, or put the new pullets into them at earliest convenience.

CLEANING ABOUT THE PLANT

The fall is an excellent time to take sanitary steps in the poultry runs and yards. Especially is this essential if the birds are going to be turned out during the warm winter days. The yards should be plowed and well turned under. There is no way in which to disinfect a poultry yard more quickly and, for most cases, more thoroughly than by turning under the surface soil. Some winter cover crop should be sowed in the fall, so that there will be an early source of green food for the birds in the spring, after the snow and ice of winter are gone. Rye is a good and cheap crop to use for this purpose. Plant it in October, if possible, so that it will get a good start before the ground freezes up.

The ranges should be very carefully gone over when the young stock is removed into the laying houses, the breeding pens, or the market. This inspection is for the purpose of disposing of any dead carcasses or unsightly litters that may have accumulated there while the birds have been ranging over the grounds. It is a mighty good practice to occasionally walk over the ranges at least once a week during the growing period to note any such conditions at that time. These are precautionary measures against disease, the enemy of health and productivity in the poultry flock.

The external conditions of the houses should be carefully inspected and repairs made at this time. Some of the buildings may need a bit of paint to insure their longer life and usefulness. Paint adds much to the appearance and efficiency of all farm buildings. It affects the health of the birds in that it preserves the buildings in which they may be housed against decay, which, in turn, means draft and unsafe protection. See that there are not wide cracks in the sides of the houses and that large holes are mended before winter comes on.

The fall is the proper time for the poultrymen especially to look over his place and get things into first class shape.

ONE FUNCTION OF THE TRAP NEST

CHAS. D. CLEVELAND.

IN THESE times of advanced agricultural knowledge in its relation to live stock the trap nest, of course, is as much an essential to the poultryman as the weigh scale is to the dairyman.

No up to date dairyman would now-a-days think of running his herd without daily weighings of the milk of each cow throughout the year and no conscientious poultryman should be without plenty of trap nests.

We hear and read much concerning the various functions or purposes of the trap nest, but almost all of the articles which we see refer to the possibility through the trap nest of ascertaining the number of eggs that each hen will lay. Startling discoveries have been made in many yards and many a breeder has discovered that the hen which he thought was in prime condition was not laying at all. Systems of physical examination intended to determine the egg laying of hens are no doubt very excellent in their way, but the trap nest is necessarily the only sure test and the trap nest test when applied to fancy poultry discloses still more wonderful revelations than is the case where it is used solely to determine the number and quality of the eggs laid by each hen. It is manifest that no system of line breeding can be successfully carried on unless the breeder knows which hen laid the egg and to determine this in an easy manner and with certainty he uses the trap nest. Each hen bears her own number. When she is found with her egg in the trap nest the egg is marked with this number and it is then put away in a separate box to wait for a full setting before being put under the hen. As soon as the chicks emerge from the shell from this setting each is given its proper toe punch and turned loose to grow up either as a champion—or something else. From both of these aspects, that is both from the question of regular laying and from

the standpoint as to how good or bad the chicks from each hen will be, the trap nest is a life saver, but I have noticed one of the disclosures made by the trap nest which a number of breeders fail to carry out to its conclusion. I refer to the fact that many of the breeding hens are not retained in the flock long enough for the breeder to determine whether the chicks from this hen are good or bad.

The tendency naturally would be after the breeding season is over on a standard bred poultry plant to stop trap nesting, to turn the hens loose in the house as their eggs are no longer required for setting, and then when the time comes for culling the flock and putting out the

hens to rusticate for the summer, to send to the butcher all those that appear to be not quite up to the standard or too old or which are not molting out right or which are a little off in appearance for one reason or another. These hens are put in a separate pen and fattened up for the butcher, and all those which the breeder thinks from outward appearances he wishes to save over for the following season are carefully kept in condition for the fall.

But experience has taught us that this is a very dangerous method of dealing with breeders. The discarded hens are too often done away with before their chicks have begun to reach maturity. The butcher comes around when the feed bills were pretty large and when a little money taken in for fat hens seemed good to the breeder, who often found much to his disappointment that he had parted with the very best breeder he had on his place.

If a fancier takes the pains that he should with the matings in the fall, coops the birds over the winter and well into the spring or summer, trap nests the breeders and punches the chicks, it is certainly very little more expense or trouble to keep over all of the breeding females until late in the fall when their off-spring will indicate with certainty just what each hen is worth as a breeder.

It is, therefore, a suicidal proposition to my mind to go through all the expense, trouble and pains of scientific trap nesting with its numerous details and then to spoil it all by guessing from outward appearances what the breeder thinks the hens have done. Some surprises will be in store for every man who thus retains his breeding females until their progeny are fully developed. Some of the results will be to say the least unexpected. It will often appear that that miserable looking old hen although she laid well gave no outward appearance of producing show stock was really the mother of the only good chicks that came out of that pen, and indeed it often times happens that the beautiful pullet upon which you had set your hopes and whose magnificent offspring you had already begun to mate upon paper for the following year left behind her a lot of children who found their way into the frying pan instead of into the show room.

And all this is simply another illustration of the saying that it is dangerous to guess; the most practiced eye cannot determine whether a chicken is going to be a good producer or not. If we are breeding a strain of birds that has been carefully line-bred for a number of generations the probability of our continuing to produce show specimens is very much greater than if the strain had not been line-bred. There is no question about this but even the best strain will produce some off-spring that are not like either sire or dam, but are so-called throw-backs, and this will always be the case in the future: if it were not so little incentive would remain to continue the breeding of any variety of fowl. If a few patient years of line breeding would produce a family all of whose offspring would be perfect specimens the trick would be easy and the most lucky man would win all the prizes all the time.

It is fortunate, indeed, for the standard poultry business that such conditions never will exist. There is always found to be something lacking which could be improved upon. Any strain can be bettered and there are no perfect specimens.

So I say one of the important functions of the trap nest is to teach us that we must not discard our breeders until their progeny are able to speak for themselves. Keep the breeding hens and breeding males until you know what the result of each pen is and then you will be in a position the following year to make changes which will be of lasting benefit.

If you do not keep to this rule you will in at least fifty per cent. of the cases throw away the only specimens that are really doing you good and that means you would have to start all over again.

ORIGIN AND HISTORY OF PLYMOUTH ROCKS

Article I—Some Interesting Details About the Early Strains—Many Different Attempts To Produce Them.—H. P. Schwab.

IN this, their Fiftieth Anniversary year, we find the Plymouth Rocks still the feature variety of America, if not of the whole world. Their fifty years of existence has been one of unusual progress and worth, their value to the great billion dollar poultry industry cannot be estimated fully, but, that they have been a leading and important factor in the general poultry success is generally and freely admitted. From their origin they created a stir in poultrydom that has ever been evident, and that has largely led to the results which we enjoy today.

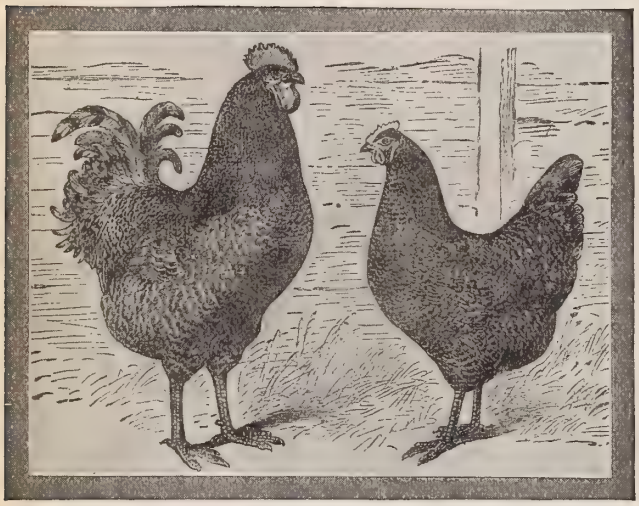
The history of standard bred poultry does not date back beyond the memory of living men, and we still have with us several of the true old fanciers who years ago by association and organization laid the foundation of the American Poultry Association that is recognized the world over and has made possible a standard that is very nearly a universal guide for all countries of the globe. Prior to those days thoroughbred poultry of several varieties were bred, and were just about what their breeders wanted them to be and fancied in size, shape and color. They were strains pure and simple, varying greatly in station and forms and particularly in color and markings. The possessions of each breeder were his hobby and his own desires followed in mating. The phenomenal interest created with the arrival of the Plymouth Rocks changed the entire condition of affairs, being fundamental in making better poultry and proper organization possible. Their history is the foundation

of the subsequent success of standard bred poultry, and their practical quality and general worth the basis of the greatest industry of today.

PLYMOUTH ROCK ORIGIN

The Plymouth Rock is what is commonly known as being a "made" variety, made by the crossing of several varieties and also the use of sports. The ideas of the originators most likely were to produce a variety that was larger than the Dominques, Leghorns, etc., and not as bulky as the Brahmas, Cochins and others of those days, the breeders seeing the greater opportunities of gain in a large medium-sized fowl that would be quick to mature, hardy, consistent layers and meat of the superior quality. Here were objects a plenty with reason and a field almost unlimited to work with and for.

The first fowl to bear the name of Plymouth Rock was developed in 1847 by Dr. J. C. Bennett, of Plymouth,



TYPE OF BARRED ROCK AS BRED IN 1872

Mass., and were first exhibited by him at Boston, Mass., November 15th and 16th, 1849, the first poultry show held in America where one pair, a cock and hen, were shown.

The birds bred by Dr. Bennett were a cross of a Cochin China cockerel with a hen, herself a cross between the fawn-colored Dorking, the great Malay and the wild Indian. Her weight was six pounds and seven ounces. The progeny in reality being one-half Cochin China, one-fourth Dorking, one-eighth Malay and one-eighth Indian. Their plumage was rich and variegated, the males usually red and speckled and the females a darkish brown. They were fine fleshed and early fit for the table. Legs large and usually green or blue, but occasionally yellow or white and generally having five toes on each foot; some had the legs feathered, but this was not usual.

This Plymouth Rock continued to exist for several years, and a large number of fanciers became interested in its succees, but it was found impossible to cause it to breed true, or to transmit its qualities with any degree of certainty, and therefore it gradually gave place to other older and more reliable breeds. I believe that within ten years it was entirely extinct and partly forgotten.

Our present day Plymouth Rocks are the outcome of careful selecting and breeding of fowls secured from crosses, with a particular object in view, and were first brought to public attention and exhibited by Mr. D. A. Upham at Worcester, Mass., in March, 1869. All agree freely that the cross that was the source of these birds was first made by Mr. Joseph Spaulding of Putnam, Conn., in 1864, and that it was effected by the use of the single comb Dominique male and a black Asiatic female, known then as now as the Black Java. Similar crosses and others of like character were made later by other breeders, but there is no denying the fact that to Mr. Joseph Spaulding belongs the credit of first producing and first improving the Plymouth Rocks of today.

The Rev. H. S. Ramsdell, one of the earliest breeders of this variety, wrote an article in the Pet-Stock, Pigeon and Poultry Bulletin for March, 1873, from which we take the following extracts:

"Our modern Plymouth Rock fowl is in no way whatever connected with the Plymouth Rock produced by Dr. Bennett some twenty-five years since, they are a different bird altogether and were produced on the farm of the late Joseph Spaulding, with whom I was intimately acquainted, and I was thus given the opportunity of knowing the facts of which I speak.

"Some thirty years since, John Giles, Esq., introduced a fowl into this vicinity call the Black Java; its plumage was black and glossy, its size large, pullets at times reaching eleven pounds in weight. They were an unusually hardy bird, good layers and of extra quality for the table. Some of these birds were bought by a Mr. George Clark, Woodstock, Conn., and he in passing Mr. Spaulding's yards noticed his fine flock of Dominiques and proposed to Mr. Spaulding bringing a few of his Javas over to cross with them to increase their size, which offer was accepted by Mr. Spaulding. When the chickens were grown the double comb and black ones were rejected, reserving to breed from only the single comb birds which retained the Dominique color."

Every writer and author without exception states that one of the parents of the Plymouth Rock was the Dominique and mainly used as the top cross. It is our opinion that the Dominique and Asiatic races were freely used that were quite common here then. Many cases of crossing have occurred later, and this same fowl—half Dominique and half Asiatic— was probably produced in various quarters later, and not in any one alone. However this may be, the facts of Dr. Bennett's birds being extinct, and that the modern fowl was originally a half-bred Dominique, are absolutely certain.

EARLY STRAINS OF PLYMOUTH ROCKS

The Spaulding strain produced most satisfactory results from the first and excellently marked and colored males and females were bred from the first cross. Year by year the young stock became better and more clearly marked, and the struggle for predominance between the two strong bloods which were united leaves fewer marks. The males were bright and clean in markings while the females were much darker, although quite well showing the desired qualifications in color and markings.

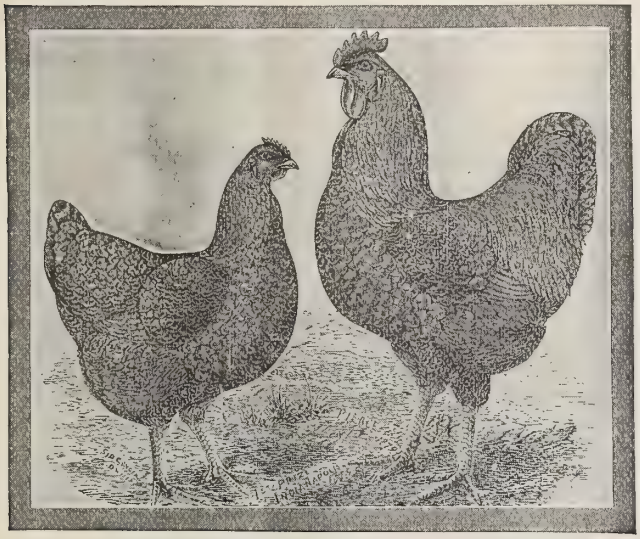
The Rev. D. A. Upham, Wilsonville, Conn., was one of the first to see and to admire these birds, and we are told with some difficulty persuaded Mr. Spaulding to sell him one of the best marked, clean-legged cockerels and the two best pullets. From this trio and its progeny Mr. Upham bred for several years with noteworthy success, for it was to his care in selecting and skill in mating that the early results were had. He also was the first to exhibit them, which event happened at Worcester, Mass., in March, 1869.

TYPE OF BARRED ROCK AS BRED IN 1878

While Messrs. Spaulding and Upham were working with this stock and along similar lines, and before they were properly introduced, a Mr. Drake, of Stoughton, Mass., had produced birds of a similar type by mating a cockerel bred from a cross of Light Brahmas and White Cochins, to Dominique females. Mr. Drake had also bought fowls and eggs from Mr. Upham and thus modified his cross with the Upham stock. It is also claimed, and we believe

by the best authority, that Mr. Drake introduced Dark Brahma blood by breeding a Plymouth Rock male upon Dark Brahma females.

The original birds of the Pittman strain were the progeny of a trio owned by a Mr. Lord, who had procured them from Mr. Upham. This was best known as the Essex strain, and considered an improvement of the Upham strain. They were greatly improved by Mr. Mark Pittman and later by Mr. H. B. Hay, who in 1876 bought some of the best Pittman birds. Mr. May sought to improve and introduced a Light Brahma cross with very satisfactory results, then later in again trying crossed them with a grade Game, said to have been a black-red



TYPE OF BARRED ROCK AS BRED IN 1882

in color. This last cross proved to be very successful, for it gave to this strain greater weight for moderate size, rich, red eyes and greater stamina.

In three years' time the undesirable feature that this cross had brought had been bred out. It is also claimed that Mr. May was the first to devise and to use the double mating system of mating with the object of producing birds that should match in the show pen.

The foundation of the Gilman strain also came from Mr. Upham, and there is no doubt but that he too made other crosses, but just what they were is not recorded. This strain was early noted for its fine quality females with yellow legs and beaks the prominent characteristics. It is quite evident that this strain has played a very prominent part in the make-up of the present day Plymouth Rocks.

The Ramsdell strain foundation also came direct from Spaulding and Upham, but there is no evidence of its future success or that its influence in any way had to do with the making of the Plymouth Rocks.

The Gray strain was one of the earliest and was the result of the crossing of Black Spanish males with Gray Dorking females, top-crossed by the Dominique male. We cannot trace this line to any particular results and believe it and its influence extinct years ago.

This is the history of the strain lines as we have them, and to make it complete in the crosses as well, we following give a list of crosses made according to Messrs. Upham and Felch.

Dominique male with Black Java females. The Black Javas were of Asiatic origin with legs indifferently feathered, black shanks and yellow bottoms to the feet. Isolated specimens were smooth-shanked.

Black Spanish, then so called, bred upon White Cochins and top-crossed by the Single Comb Dominique. The Black Spanish used in these crosses were called the Minorca Spanish, with red faces, white ears, and much smaller combs than the present-day Spanish or Minorca.

Dominique male on Buff Cochin females, and inbred. The Cochins were then called Shanghais.

White Birmingham male on Black Java females, top-crossed by the Dominique male.

White Birmingham male with Black Java females. The barred female specimens produced from this cross were bred to the males of the above cross.

The above is, I believe, a complete and true account of the origin of the earliest strains of Plymouth Rocks. Out of this varied amalgamation we have a race of which we are justly proud, for it stands unrivaled today, and it also was American breeders' first achievement in breed-making.

From this large and varied list of crosses the Plymouth Rock sprang, and it seems quite evident that most of these crosses were made with the one point in view, viz: color and barring, and also that this was obtained in several different ways, the Dominique male being the great and important factor whose influence dominated and whose color and barring was to be blended and improved. But when we consider size and shape, and seek to give to any one of the early breeders for these chief and most practical qualities, then we have to stop, for the early writers and historians gave these important features no notice beyond possibly refering to their size on very limited occasions.

The question of who really originated them is settled beyond any question, but to whom to credit the size and shape given will always be an open one, with no particular harm if it is never settled, which now seems likely. In the production of the Plymouth Rocks there is honor enough for all, and plenty of it. The original breeders, Messrs. Spaulding, Upham, Drake, Ramsdell, Pittman, Gilman, Gray, May and some subsequent breeders whose years of work in mating and breeding have all had beneficial effects in the variety as we have it today, can well share all the honors. They built far better than even they knew or could possibly realize, and the results of their labors will ever live to their memory as a monument to their great accomplishment.

When first produced no other name was needed; they were simply Plymouth Rocks and became well known the whole world over by this title. Since their introduction the White and Buff Plymouth Rocks, also the Partridge, Silver and Columbian, have been added, consequently the original stock, on account of their color and markings, are now known as the Barred Plymouth Rocks.

No other fowl has ever enjoyed equal popularity, and no variety has the same hold on the fancy or commercial breeder as this one. Hardiness and character was so strongly bred into the original Plymouth Rocks that they from the first gave evidence of their special worth in a very general way. Hardiness is first generally understood to mean health, strength and vigor. These qualities, combined with quick growing, early maturing and heavy and consistent laying qualities, insured for them the greatest popularity from the first. That they have met the requirements that insure profit in poultry is most evident by the tens of thousands of breeders who are breeding them today in their purity for fancy and general purposes.

Article No. 2, The Barred Plymouth Rock of Today, will follow next month.

Son of "Lady Hanover," champion hen Madison Square, New York, 1914. Owned and bred by C. N. Myers, Hanover, Pa. Unretouched photo.

WHAT A POULTRY PAPER SHOULD BE

Its True Mission Should Be To Give Accurate Information on All Subjects Pertaining To the Betterment of Poultry—Reese V. Hicks.

THE first mission of any paper is to enlighten its readers. This means where the publication is a "trade paper," and under which classification the poultry papers are included; it should give accurate information on the particular trade subject to which it is devoted.

In poultry raising much depends on buildings, equipment, and how the birds themselves look and stand. Hence it is important that a poultry paper be mechanically a paper that can run good half-tone pictures and thus show lifelike illustrations of the fowls themselves, as well as houses, equipment, runs, &c.

All this requires printing on fairly good paper, with good ink and good press work. It requires neatness and should be gotten up attractively so that it will appeal to the readers' sense of beauty and harmony.

The information it gives to its readers should be first of all accurate. There is room in every line for misrepresentation and for careless, loose statements, and in this the poultry business is no exception.

As the poultry business is a business in which it is easy for anyone to make a start, it is very important that the methods advised be fair, unbiased, and accurate, so that the novice will not be misled at the very beginning of his poultry career along lines that will mean his undoing at this business.

This means that the editor of a poultry journal must carefully read the articles submitted for publication to see that they are founded on facts and do not contain a lot of extravagant theories that will not work in practical every-day life.

This, of course, implies that the editor must be a man who knows the ins and outs of the business and able to distinguish between wheat and the chaff.

The poultry paper of today should avoid what is known in newspaper circles as "yellow journalism" or sensationalism. It is unfair to the readers to insinuate or imply things that are not known facts or else facts of double or doubtful meaning.

It is true that it is possible in poultry journalism to go on the theory that the public wants to know what is unusual or sensational, but such a policy will not stand the test of time. It may be that the poultry public wants to know about the "nighcuts" and extravagant claims, such as the 350-egg hen, but by-and-by they learn that such sensational claims have very little foundation in fact, and instead of being educated and led along proper lines they turn from the poultry business in disgust.

As the average poultry paper is read from cover to cover not only the reading matter but the advertising as well, it devolves upon the careful editor to see that he does not publish in the reading matter or advertisements any extravagant claims that are not backed up by facts and capable of trustworthy proof or demonstration.

Here is a field of considerable speculation and uncertainty as to how far an editor should go to do his duty to the reading public, whether he should debar all suspicious claimants in advertising or only those that are known to be proven frauds.

To the writer's way of thinking, if he carefully investigates each claimant and finds the claims are within the limit of good poultry possibilities, and that they have the ability to make good on the claims, he has done his duty, without guaranteeing the delivery of the goods.

First Prize Pen White Wyandottes at Boston, Mass., bred and owned by John S. Martin, Port Dover, Ont. Mr. Martin by his consistent winning has brought his "Regal" White Wyandottes to the front and for years has been a leader in this line. At this writing he has just made his tenth annual exhibit at the New York State Fair, winning five first prizes.—H. P. S.

However, if he desires to go further and guarantee the transactions between every advertiser and every buyer of his advertisers, he is opening up a field that may cause him some arguments, because differences of opinions will arise as to the merits or demerits in every exchange. Probably his surest duty to the public is to eliminate those advertisers that are known to be outstanding frauds, and to offer

himself as a mediator between the readers and advertisers where misunderstandings arise, as they often do.

Advertisements are important to the public, because nearly all new appliances that are really useful are first patented and offered to the public. Thus the keen business man is constantly on the lookout for any improvements in his line, and the surest way of finding them when they first are put on the market is to see them advertised in the trade or poultry journals.

The poultry paper has a duty to its advertisers. It accepts their money with the understanding that it will do its best to earn them a reasonable return. This makes it imperative to maintain its circulation to what it claims, and that it should claim no more than it actually has on its bona-fide list.

It also should protect the honest advertiser who sticks to facts from the less scrupulous who makes claims that cannot be proven by actual test. While it owes a duty to protect its readers from the fraudulent advertiser, it owes the same duty to the advertiser to protect him from the reader who may attempt to blackmail him with a threat of unfavorable publicity if the advertiser does not come to the reader's viewpoint in any controversy that may arise between them. While it is good policy to always work on the theory that the customer is right, yet those who have seen poultry correspondence from both standpoints will admit that the customer is frequently wrong in his claims against the advertiser. The writer has been connected with the newspaper end as well as the poultry breeding-and-selling end, and has had the opportunity of seeing the correspondence from buyers who have asked him, as a newspaper man, to force the advertiser to make good, according to the buyers' viewpoint when the buyer was entirely in the wrong and absurd in his claims and position.

When it comes to the matter of publishing the winnings at poultry shows, it is a question whether the poultry paper should publish only the winnings of those breeders who are its advertisers, and who really furnish the cash to run the paper, or whether it should publish everybody's winnings on the theory that such publicity is really good poultry news to its readers. Personally, the writer does not believe that such publicity has sufficient news value to justify its publication, except in the case of the largest and most important shows, and even in respect to these it is doubtful whether it would not be better policy to publish the winnings of only those breeders who by the fact of their being advertisers show that they desire such publicity.

Winner of three first prizes—1st pullet West Michigan State Fair; 1st hen Iowa State Fair; 1st hen Georgia State Fair. Owned by Geo. B. Ferris, Grand Rapids, Mich.

OUR GUARANTEE

We guarantee every subscriber against loss due to fraudulent misrepresentation in any display advertisement appearing in Everybodys Poultry Magazine providing the subscriber when ordering the fowls or merchandise states that the advertisement was seen in Everybodys Poultry Magazine and places the order during the month or months in which the ad is inserted in our columns and notifies us of the fraudulent misrepresentation of the advertiser, giving full particulars, as soon as it comes.

Fifty cents the year. Three years for $1 in U. S. and Mexico. Canada, 25 cents per year extra. Foreign countries, 50 cents extra.

A renewal blank will be inserted when subscription expires.

ADVERTISING RATES ON APPLICATION

SAMPLE COPES sent free to all interested. Subscription agents wanted.

Manuscript and copy for change of advertisement must be in our hands promptly by the 10th of the month preceeding date of issue. New business can be accepted to the 20th, but no special position can be assured.

WHEN WRITING ADVERTISERS ALWAYS MENTION EVERYBODYS

It is indeed very gratifying to report the existing poultry conditions as we have seen them in our travels, East and West. Since our last issue we have made two trips to Ohio and one into Indiana, meeting the breeders of the Mid-West in great numbers, also visiting at several homes and finding at all places and all homes more and stronger confidence in all the future and more and better stock. That the breeders are well prepared with quality is evident from every viewpoint and that this season's business will show a strong increase over that of the past two or three years is also assured by the numerous inquiries being received.

The exhibits held to date all show a wonderful increase in entries, as well as in quality. At the Forest City Fair, Cleveland, Ohio; the Ohio State Fair, Columbus, Ohio, the Indiana State Fair, Indianapolis, Ind., were seen record entries of choice quality birds in every variety, while the entries were larger than ever before. We were also assured they were of better quality; but, be this as it may, the quality seen at these shows this year was all we could desire or ask for. The winners without exception were of the class to win at any show East or West.

That the average breeder has learned the value of conditioning and has mastered its principle is very evident, for we noted with special interest that birds in health, vigor and feather quality predominated in every class and don't believe that we saw a dozen all told that were carelessly shown at all four shows combined. This is a feature well worth noting, for the breeder who will carefully condition his birds and tries to exhibit them at their best, shows his interest in his stock and work. Real personal interest in this line has not been what it should have been in the past, and this increased interest spells more progress and more poultry success.

With these fairs of the Mid-West the New York State Fair should also be considered. This great show, with over 9,000 specimens entered and shown, has set a new mark for fall exhibitions. It was a masterpiece, complete in every class and variety of highest quality and most beautifully shown and displayed in the finest poultry building in America. We expected the empire State to put up a great show, but this display surpassed all expectations for numbers and quality. The exhibitors from many states assembled here and made this beauty show possible.

The striking features noted at all four exhibits, were the general size, bone, shape and vigor of the birds shown. Hardiness and strength was the outstanding quality, not only in the winners, but in a very large percent of all birds seen. They appeared unusually strong, the evident result of careful mating, breeding and growing. A similarity in type and shape, good head points and the best of quality eyes. With this kind of stock, the future promises much for the poultryman and poultry interests for special value is noticeable in this kind of stock to all alike.

We find the breeders of all sections confident in the future and all expecting a prosperous season. They have the stock with quality assured to take care of all. Standard bred poultry is annually

casting its worthy influence over new sections and thousands of poultry raisers are taking notice, with bumper crops in grain, fruit, etc., surely the future looks well, but first of all to us is to note the improvement the breeders have made, the excellent quality of their stock with the double assurance that the buyers now have their chance and will receive greater and better value than ever before.

H. P. S.

Good farm land, well enriched and properly worked, will return an average value of about fifty dollars per acre in crops. The cost of working, seed and planting must be deducted from this, which varies considerable, according to the crop grown. The farmer in his work is content. His out-of-door life appeals to him and if he works well and farms consistently his chance for gain and improvement along with the freedom and labor with nature, are bound to be profitable to him and assures for him much happiness away from the rush and troubles of the industrial centers.

Soon now his fall work will be done and beyond his chores in winter he will have ample time to rest, read and think—to enjoy the fruits of his labor and to plan for the future. He knows the possibilities of his earning powers in farming and he also knows that times and conditions are changing and to be abreast of the times he must conform to them to some extent at least.

Now while he has the opportunity, let him consider the poultry question. No matter what his location this question of more poultry looms up high and strong and appeals to those who know its possibilities. It is one that should receive careful thought in every household. While its consideration study and reading will broaden his views, he will also see for himself betterment and greater prosperity assured. Poultry on the farm is like ready money at any and all times. You can turn it over at will, while there is also a steady flow of receipts for eggs, broilers, etc.

If every farmer would donate an acre of land to poultry, he would be adding an additional line that would pay him several times over the amount the land would produce him in crops. Most every farm has its few acres of untillable soil which, if not too wet would make ideal poultry yards, then also fruit could be set and thus the land utilized to advantage.

On one acre of land, which need not be your best land, 500 laying hens could be housed and yarded, and if cared for and fed along proper methods they would return an average of one dollar per head per year. These figures are within all reason. They are possible and they can be increased.

Poultry adds to the farm besides richness, a product salable at all times. Poultry and eggs have an unlimited demand, and particularly when standard bred poultry is kept. The highest market prices for eggs and carcasses are assured. We ask our readers to look well into this question of poultry. To study it from their location and their condition and to see if they can't find in it congenial work and profit. Don't jump into this to the limit of your abilities or capital, but start with a good pen of birds, raise all you can from them next spring, cull close and reserve the best for the future. Try this now. Begin now and let your flock and plant grow as does your knowledge, profit and interest in the work.

H. P. S.

The Booster is the man with the smile. Meet him when or where you will, you will see the smile. Hear his laugh and hear the bright side of the world's doings. He is the man with confidence, with trust in himself and his fellowman and his bright nature is like sunshine to one and all alike. In our line of poultry we have many "Boosters," in fact a great many and they are the bright side of all the good we have. They are our successful men and women, who live and let live, who boost and who find good things, and good business with deserved prosperity.

Then we have the "Knocker," those who are always dissatisfied with everyone, themselves included. They deal in "suppositions" and "maybes" they have no pleasant thoughts, see no sunshine and harbor within themselves a "Grouch" to kick and to differ.

Thank goodness, that there are but few of these; but that few are too many. No industry needs congenial boosters more than does poultry and none is more worthy. So let us all start over, forget and forgive and labor with but one ideal in view, viz: "General Poultry Success." The time for sound substantial business is here. The breeders have both quality and quantity which should be sold at a profit to them and of value to the buyers. The cause of standard-bred poultry is great. Of vital importance to thousands upon thousands and can be made of far greater value, if we will but all do our plain duty and "boost" now and ever.

H. P. S.

MILLIONS IN POULTRY

Considered in an all around sense, Missouri is the most wonderful state in the Union. For instance, it is the only Commonwealth which has two great Regional Reserve banks within its borders and added to its great commercial prowess is the fact that during the average year it produces a new farm wealth valued at $50,000,000—and one-tenth of this sum comes from poultry. For years Missouri has stood at the head in Poultry production, and it was therefore fitting that a Missouri hen should have carried off first honors in last year's World Egg Laying Contest. In the space of six short years, the Missouri hen could pay for digging the Panama Canal—the greatest engineering feat in history. Or in twelve months could build over 16,000 miles of rock roads at a cost of $3,000 per mile. Think of the train loads of Farm home furnaces, pianos, Victrolas, washing machines, kitchen cabinets, furniture, dry goods, clothing, shoes, steel ranges and a hundred other wholesome necessities which the farmer wives of Missouri can buy during the average year with the $50,000,000 of "pin money" which they derive from chickens, turkeys, geese and ducks.

* * *

THE DEPARTING BIRDS

A laughing sun, a gay earth, with frosty patches and a yellow and black warbler filling his throat with the sweet air to make it into sweeter melody—so far everything seems pleasant. As a matter of fact, however, the sight of that bright little bird is

only a confirmation of our fears. The almanac said several days ago that the birds were leaving us, "slipping away quietly," it said. We were certain that there was nothing quiet about it. The birds had never made half so much noise saying it. We were justified, therefore, in hoping that the almanac was wrong about the rest of it, and that is why we cannot enjoy the warbler's song. The almanac must be right after all. This is the very day that it said he would be coming down from the north on his way to the south. The very way it was put was annoying—"from the north to the south"—as though we were no place at all. And, of course, the fact is even more annoying than the statement of it. We know that he is from the north because we saw him up there a few weeks ago. We visited his nest in the apple tree and inspected his children cowbird foster child and all. He seemed very well content where he was then, and it is difficult to understand why he is so determined to go south. We should like to remind him of the man in the moon, who came down too soon and the dire fate which befell him, but we are not quite clear as to where the man in the moon came from, or where he was going or as to what really did befall him. At any rate we do not want the birds to go south and take our last bit of hope of summer with them. It may be reasonable enough that since birds have wings they must fly, but sometimes they seem a little too "wingy." They are like those unhappy people that are to go a little faster and farther than their neighbors, but haven't any place to go. Always looking for something better they miss that which is good. No doubt we are a little envious of the birds and of the lands to which they are going, but we have tried to make things pleasant for them, and we shall miss them very much.

* * *

THE ETERNAL CONFLICT

Society is nothing more than a continuation of the conflict of Nature under the guidance of Intelligence. It is vain to hope for any amelioration of society from the prevalence of an intellectual education. Culture of the intellect supplies new weapons for use in the conflict, and may render it less rude in appearance, but cannot change its nature. Doctrines and creeds are forms; the Will supplies their contents. Just as a vehicle may convey substances having wholesome or injurious or indifferent properties, so any system of thinking—theological social or political — may be made to bear any purport, good or bad. To try to shape opinions so that they may not be made subservient to any evil purpose, is all labor in vain.

* * *

A CLOCK FOR THE HEN

Mrs. A. L. Stuchell, of Pittsburgh, whose hobby is light Brahma chickens, believed she had hit upon a sure remedy for broodiness when she put an alarm clock, set to ring intermittently, beside a persistent setter. When the alarm started the hen was annoyed for a moment and then tucked the clock under a wing. There, without ruffling the bird's equanimity it clattered until run down. The hen seemingly concluded it had acquired title in the clock, for when Mrs. Stuchell tried to recover it she received a resentful peck.

* * *

LOUIS O. KETTERING

There is a reaper whose name is death,
And with his sickle keen,
He reaps the bearded grain at a breath,
And the flowers that grow between.

In the death of Louis O. Kettering, which occurred at Pittsburgh, Penna., August 23rd, the Poultry World in general and his thousands of friends in particular, have lost one of the most brilliant and distinctive characters. Mr. Kettering had been in poor health for several months, still the news of his death shocks us. We can

Exhibition Female, bred and owned by Charles W. Orton, Greensboro, N. C.

hardly believe it. But such is life, we have to answer at the call.

Mr. Kettering was owner of the Sandy Lick Poultry Farm and for years had bred the Buff, White and Black Orpingtons, making a rare record as a breeder and exhibitor and in producing a most valuable practical line of stock. Being successful in other lines, poultry was his recreation, while his love for the fancy was second only to that he bore for his fellowman.

Our loss is great. For years we have known 'Lou" as a particular friend, so we may be permitted to speak publicly of the respect and affection we, like all those who knew him, had for him. We mourn his loss and extend our sincere sympathy to his family and friends.—H. P. S.

* * *

COW HOLDS WORLD'S RECORD

The world's record for butterfat production is again broken, this time by the stable mate of the former world champion, who held the title for only three months. The new dairy queen is a Holstein-Friesian cow, Finderne Pride Johanna Rue No. 121,083. She gave in one year 28,403.7 pounds of milk, equal to 13,211 quarts, or over nine gallons a day. This milk contained 1,176.47 pounds of butterfat, equal to over four pounds of butter a day. She hails from New Jersey.

* * *

SKIM MILK

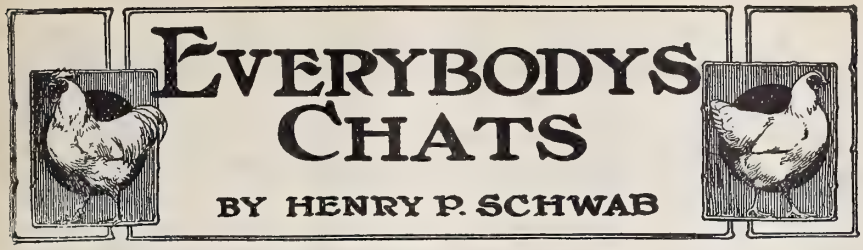
Skim Milk is very economical food material, in the opinion of experts in the Department of Agriculture and might well be more largely used as human food—this in spite of the fact that it is nine-tenths water. The argument for economy is based on the price at which it is usually sold, and upon the composition of the remaining tenth, on the nutritive portion. The only nutrient taken from it by skimming is the butter fat. There is left, therefore, in the skim milk not only all of the sugar, which amounts to about four and one-half parts in every hundred, and all of the mineral substances, but also all of the protein. The last named substance is important because besides serving as fuel for the body, as fats, sugars and starches do, it also supplies nitrogenous tissue-building material. The proportion of protein in skim milk, as well as of the mineral constituents, which are also valuable for body-building, is even greater than in whole milk, the department expert declares.

In recommending skim milk as food the fact should always be kept in mind that it has gone through one more process in the course of preparation for family use than whole milk has—that of separation or skimming the department warns. This, in the case of food material so liable to become contaminated and to be the carrier of disease, is a very important matter, and the consumer should take even more pains in buying whole milk to know that it has been carefully handled, particularly if it is to be used raw.

* * *

UTILIZING ALL THE GROUND

This country is so new and so given to thinking of farms as huge areas for cultivation that the idea of utilizing every bit of land as Europeans do, makes little headway here. Intensive cultivation is practiced, but on the outskirts of eastern cities, where some farmers are making good livings by intensive cultivation of small tracts of land there are other tracts just as good lying idle, which at least could be made to yield vegetable supplies for several families and at the same time pay a small rental if cultivated by a few workmen in their spare time. School children's gardens on vacant lots in various sections of this city show the possibilities of such ventures. The old American idea that every family with access to a bit of land should have its own garden was an excellent one. It would be good to have it revived.



Wonderful have been the several displays of poultry seen this fall. The exhibits are larger than usual and the quality better.

* * *

The Forest City Fair opened the season with 3.000 birds. The Rochester Exposition with 2800. Ohio State Fair with 2500. Indiana State Fair with over 3000 and now comes the New York State Fair with some over 9000 birds.

* * *

These figures well give the condition of poultry, the prospects for the season and the increased interest which bids well for the future.

* * *

It was a real pleasure to meet so many old-time friends at the Ohio and Indiana shows. The "Old Guard" of the mid-west has been thinned with time, but the survivors retain their quality and are moulting in as sleek as ever.

* * *

Every poultryman in the mid-west is a friend of "Everybodys" the compliments received would fill a book.

* * *

Of course we will have to give them credit now of knowing a "Good Thing" when they see it. We appreciate their support also and will endeavor to always merit their goodwill and confidence.

* * *

Judging at the Rochester Exposition on a warm day was too much for Hamburg-Bill-Minnich for that night on his way to the Ohio State Fair he tumbled from his upper into a lower berth where a peaceful Barred Rock man was dreaming of the Black Spanish in the coop ahead.

* * *

The A. P. J., special automobile arrived at the Ohio State Fair with H. H. Couburn, Louis Stahmer and P. K. White aboard. They are doing the states and were flush with contracts and cheering reports from all sections.

* * *

When you have no reason to smile, keep in practice anyway.

* * *

Since the advent of the automobile the chicken seems to be in more urgent need of nine lives than the cat.

* * *

The new Standard, as expected, has been found faulty which will likely cause a delay in the second edition. But what are we to do with our faulty ones at $2.00 and $2.50 each?

* * *

Now that Rule 17 has been tabled for a year or more; lets have a little rest on that line of guff. The editors who have expended so much time, space and ambition should feel relieved and improved to have all that out of their systems.

* * *

Probably the subscribers to their papers will now get some poultry news and articles that they paid for and expected.

* * *

I remember, I remember
The place where I was born;
It had a patch of onions here
And there a patch of corn;
(Which always dims my memory
Of that old quaint abode,
For ere the one was weeded out
The other must be hoed.)

* * *

Mr. J. W. Chapman, Canandaigua, N. Y., Secretary of the Rochester Show and breeder of Barred Plymouth Rocks was a visitor at the Exposition. We hope soon to visit his new place to see his fine stock that has made many records for him.

* * *

Luther Burbank having turned his attention to the improvement of the human race, we may be justified in expecting the early developement of the appendixless person.

* * *

Mr. C. F. Rankin personally is becoming as famous as his line of R. I. Reds. He visited both the Forest City Fair and the Ohio State Fair, his distinctive features are his smile and the wart, both make friends.

* * *

Secretary Campbel, of the A. P. A., is visiting the shows and giving his aid in organizing the State Associations is doing some rare good work that in time will insure strong organizations properly managed that are sure to benefit poultry and poultrymen.

* * *

"Its five years ago today and I'm going to celebrate my wouldn't wedding.

"Wouldn't wedding? Wooden, you mean!"

"No. Wouldn't. Five years today since I asked a girl if she'd marry me and she said she wouldn't

* * *

Rain in abundance has been the rule in most every section this fall. It has wet down things pretty well and made a lot of mud at the fairs, but it hasn't even dampened the enthusiasm of the poultrymen

* * *

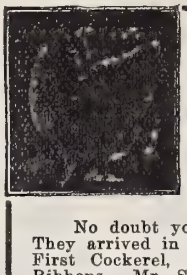
Evidently Doctor Woods has gotten himself mixed-up. We don't know when or how, nor do we care any more than the Doctor does. The few wise (?) alleks we have are ready with or without reason to jump at any time.

* * *

An up-to-date sartorial authority announces that a man's tie ought to match his hair. By a strict adherence to this rule a good many of us would have to wear a shoe string for a tie.

* * *

When you visit the mid-west and



Regals Keep Winning

Last month I told you about the splendid quality of my early Cockerels and Pullets. This quality has now been abundantly proven by the early shows. In five of the largest of these early shows, strings furnished from here have made wonderful records. One of these shows I have permission to refer to and I take pleasure in giving the letter of my customer:

Cleveland, Ohio, Sept. 3rd, 1915.

Mr. John S. Martin, Port Dover, Ont.,

Dar Sir:

No doubt you are wondering how the birds came out at the Forest City Show. They arrived in A-1 condition and made the following win: First Cock, First Hen, First Cockerel, Second and Third Pullet, First Pen, Best Display and Champion Ribbons. Mr. Sewell was much impressed with the First Cockerel and I told him he was a Regal. Will want more birds later.

Thanking you, I remain

Yours truly, JOHN E. STOLL.

The four other shows were just as important and the winnings were fully as good. What other White Wyandotte Breeder could send out five winning strings all inside of one month? Besides I have been doing this for years. Each year I have hundreds of chicks ready for the early shows. Does it not prove that the Regals have the vigor and vitality to reproduc themselves at any season of the year, January or June?

Why not win your show and at the same time make a start in Regal White Wyandottes by placing your order now, thousands to select from.

FREE—Send for catalogue and summer sale list; giving description of several hundred breeders I am offering for sale.

Send one dime for the Regal White Wyandotte Book telling all about White Wyandottes.

JOHN S. MARTIN, Box D, PORT DOVER, CANADA

MAPLE GRANGE BARRED PLYMOUTH ROCKS

BOTH MATINGS

Bred under ideal conditions for Strength and Vitality.
Hundreds of Yearlings and Young Stock now ready for you.
Let me price you on what you desire.

S. M. GOUCHER, BOX E, MOORESTOWN, N. J.

hear the call of Dad or Pop, just think of Hewes that's all.

* * *

We know of a breeder with a well established line who wishes a partner to take an active interest with him. This is an unusual opportunity for some one with from two to three thousand dollars to invest.

* * *

At the Indiana State Fair we met Mr. M. S. Barker, Thorntown, Ind., whose black Langshans we have handled at the M. S. Garden Show and found him to be just the grand and sleek a fellow we expected after knowing his stock.

* * *

There were other sleek ones there too, believe me. You can't pass A. E. Martz who is the president of a bank and of the state association as well but that you feel a special pride in being a poultryman.

* * *

"Everybodys" is still growing and improving, it receives our best efforts and this with the generous aid given accounts for the progress made. We wish to serve all in the best possible way and ask our friends to ever recommend "Everybodys" The peoples Popular Poultry Magazine.

* * *

Stop your criticising, friend—
Never mind what others do,
There are labors without end
Calling for the best of you,
There's no time for cynic sneers—
Let the usless idler scoff—
Hie you to the world of tears—
That's the ticket—now we're off!

* * *

Better a song in the heart than two in the flat upstairs.

* * *

The more money a man has the more he is abused—and the less he cares.

* * *

The Great New York Fair with over 9000 entries in Poultry, Pigeons and Pet-Stock has set a new mark for the others to try for. Supt. Manning in this great entry has proven his popularity. This show will be one of the season's best events that we will report fully.

* * *

Light burdens long borne, grow heavy.

Pat and Mike who were neighbors in the "Ould Country," happened to retire from the public gaze about the same time. Pat had stolen a watch from a blind man, while Mike mistook a friend's cow for his own and sold it. As luck would have it, they were drafted to the same prison, and at church parade on Sunday morning they had a chance for a moment's forbidden conversation.

Said Mike: "Top ay th' mornin' to you, Pat; an' phwat might the time be? Sure an' 'tis you that knows all about watches."

But Pat was not to be done. "Mike my lad" he replied, "begorrah, an' 'tis just about milkin' time."—Tit Bits.

For Winter Results and Poultry Success

The Winter's Success With Your Young Stock Depends Largely Upon the Care Given During the Fall Months.
—By H. V. Tormohlen.

THE problem of where to start to make a success in the poultry business is as much a question as the old one "Which Was First The Hen Or The Egg." So in advising beginners or trying to help these with many years experience out of difficulty the problem always reverts into the advice so often quoted "Get Good Strong Healthy Stock Or Strong Germed Eggs Full Of Vitality" yet this advice seems perplexing for when are we sure we have the stock described as filling the bill and if we have the stock described how are we sure they will lay the kind of coveted eggs desired? Between the hen and the chick there is always plenty of room for failure and also between the chick and the adult there is plenty of room for failure or if not utter failure weakening the vitality.

So in attempting to give the reader an idea of the condition his young stock should be in to make a success of the winter work I am compelled to go back to the parent stock of the chicks you are working with and even back two or three generations and state that the chicks should be hatched from eggs laid by good healthy vigorous stock and the eggs from this flock should be picked and cared for with care and the chicks should never have a "set-back" of a single day during their summer existence. What I mean by a set-back is that they should not be annoyed a single day with lice, with the bacteria of white diarrhea. No matter if they only have a slight attack it will always weaken them to a certain extent, with confinement in small bare runs with no shade, with crowding, with a lack of proper brooding when young and so on through the whole catagory of evils that are the hard luck agents of so many poultrymen.

I may be a crank on the subject of raising chicks under ideal natural surrounding, but I have good reasons to believe and believe the experience of poultrymen much older than I as well as science will bear me out in the statement that even keeping small chicks confined after sun-up causing them to fret and worry will take several hours a day growth from them. The change in the quality and quantity of milk given by cows when annoyed or worried is a fair example of what I am trying to impress upon the grower of young fowls. Therefore it is my aim to so raise my fowls that they never give a cheep of the note of dissatisfaction, annoyance or unnatural hunger. With life sailing on for them under this even tenor from the day they are hatched until they are 5 months of age when most of the pullets are laying, I believe I am justified in claiming with due conservation that I have gained a month in size and fifty per cent or more in vigor and stamina over the chicks that have had a slight attack of white diarrhea

6 to three dozen head lice for a week or two before the owner noticed them waning in spirits, three to three months annoyance of mites at night and long confinment in foul coops after sun-up as well as confinement in small bare runs during the day no matter how well fed. These are the little things that go to make the winter's work successful and profitable or unsuccessful and unprofitable as the individual case may be.

Many poultrymen gave their success for the season by the number of chicks they have had to die but taking the sensible view of it when a chick is so sick it dies with a reasonable degree of surety should we not find several more in the same flock that are so sick they have lost several week's growth. We should, therefore, not watch out for the deaths in our flocks before we become alarmed but rather live with them so that we will notice the change in their spirits when a chick suffers its first annoyance no matter from what source.

With such a flock you can go into the winter with great assurance if the same care and attention to details is followed as in babyhood. The cockerels should have been removed at the first sign of annoyance. The pullets should never be frightened or chased any more than a modern dairyman would permit such a thing with his cows. Young fowls should be taught to follow like sheep with the use of a little gfain and I find it much easier to take them where I want them by this method rather than bunching them up and frightening a week's growth out of them. For this reason I like to move the brood coops they are in gradually up to the winter house so that late in the fall or whenever according to their age largely, whenever I want to change them from their colony coop to the house for the winter they are so accustomed to roosting near the house that the first night I remove the colony coop away entirely they hardly know the change and go right in the house. The change has been so gradual that they never are annoyed and worried a single hour. These attentions to trifles and details might be called nonsense and theory by some, but by actual experience the more I live with fowls the more I find this attention to small details pays. It brings the pullets up to their very best and yet does not bring on egg production too soon when they are far undeveloped nor does it pay less well with the cockrels whether for broilers or breeders. Kindness and attention to details with any kind of domestic fowls or animals will pay handsomely coupled with experience. We cannot really be kind to our wards until we have experience to know how. The bee-keeper even preaches kindness and attention to details and it is common knowledge that the bees disturbed and annoyed for a few minutes will lose the better part of a day's work.

The pullets then when in the laying house for the winter should be taught to use the house as soon as cold weather begins. Do not wait until the ground is frozen before the house is gone over for the winter and plenty of litter added to the house. To carry the pullets from the late fall into the winter laying all the time is a trick so as to speak, and the trick is none other than watching carefully the wants of the young fowls and supplying every need as winter closes in about them. Early in the fall on cold mornings or rainy weather accustom the pullets to use the litter by giving their scratch grain in it. The dry mash hoppers of course, are in the winter house and kept full of mash all the time. This makes the poultry house the most inviting place the young fowls can find and they will take to it like ducks to water. When real cold weather sets in the fowls hardly notice the doors are closed and they are confined all day. Thus their nervous system does not have a single shock, they never fret and worry at being confined causing the egg yield to stop right at the time cold weather commences and eggs are high, but they go right on

OWEN FARM BIRDS WILL WIN WHEREVER THEY ARE SHOWN

——ARE YOU SHOWING AT THE——

PANAMA-PACIFIC INTERNATIONAL EXPOSITION?

Owing to this show coming so late in November I will be unable to attend, thus missing my first World's Exposition since the Pan-American. My birds will be there in customer's hands and will win more than their share of the Firsts. Now is the time to write me and secure the all-powerful backing of Owen Farms Birds and make your winning certain. Will sell only one customer for any one class and have already booked a few classes, with other orders pending.

If You Are in Dead Earnest in Your Desire To Win, Place Your Order With Me.

——OWEN FARMS——

Buff and White Orpingtons, White Rocks, White Wyandottes, S. C. Rhode Island Reds and S. C. White Leghorns.

have demonstrated their superior merit at MADISON SQUARE GARDEN (New York), GRAND CENTRAL PALACE (New York), BOSTON, CHICAGO, CLEVELAND, PITTSBURGH, SYRACUSE, ALLENTOWN, ATLANTA, AUGUSTA, NASHVILLE, MEMPHIS, LIVERMORE, (Calif.) and BROCKTON (Mass.), by winning

MORE FIRSTS THAN ALL COMPETITORS COMBINED

THOUSANDS OF PRIZES at hundreds of shows all over the WORLD have been won by Owen Farms Birds in customers' hands.

My birds are line bred from generations of winners and win consistently year after year. My birds have made good in the past and will make good in the future. This is the reason that the majority of my orders come each year from old customers or from new customers who have been advised to buy here by old customers. This fact gives me more personal satisfaction than any one thing connected with my growing business. Every bird is selected for you by the writer, or my superintendent, Mr. Davey. We are a unit in giving every customer just a little more value than he pays for or expects.

I do not want any customer to keep a bird that does not please him, and any bird I ship can be sent back after forty-eight hours' rest and the purchase money will be promptly returned. I will pay the return expressage on males at $10.00 or more each and on females at $5.00 or more each.

WINNERS FURNISHED FOR ANY SHOW IN THE WORLD

No matter where you wish to win I have the bird or birds for you to make the winning; line-bred birds of my own growing, that will breed you winning chicks. My supply is not endless and when I have booked all the birds of exhibition quality I can spare I will stop quoting. Write me your exact needs and place your order before a competitor gets ahead of you.

370 OWEN FARMS BIRDS HAVE WON FIRST PRIZES AT MADISON SQUARE GARDEN, NEW YORK.

——1915 QUALITY——

Selecting and shipping birds to customers for showing at the Fairs and for breeding purposes have made me realize more and more the superlative quality in my 1915 youngsters. **They are the best ever grown on Owen Farms, which means the best ever grown anywhere.**

——UTILITY QUALITY——

Owen Farms Birds are famous the country over for size, bone, perfect health, vigor, prepotency and heavy laying qualities. There are no birds that excel them in these important functions and very few flocks anywhere near as good.

MY BIRDS LIVE, GROW, LAY AND PAY

Husky Utility Cockerels, $3.00, $4.00 and $5.00.
Pullets, $2.50 and $3.50.

——BREEDING BIRDS——

You are now planning your matings for the coming season. Why not place your order with me at this time for future delivery? My flocks are very large now and can make a splendid selection of a bird or birds to meet your exact requirements. A 25 per cent. deposit will hold your bird or birds for you and delivery will be made when you need them. An early order will work to your advantage and to mine.

SATISFACTION GUARANTEED EVERY CUSTOMER EVERY TIME

and this guarantee is backed by my 26 years experience in selling thoroughbred poultry.

Printed Matter Free.

OWEN FARMS

163 William Street, VINEYARD HAVEN, MASS.

MAURICE F. DELANO, Proprietor——FRANK H. DAVEY, Supt.

laying and will lay through the winter if the house is built substantially and well ventilated and lighted and the proper care and feed is given the young pullets, Compare this method with that in vogue with many where the young stock is all over the place roosting in the barn and on fences and shifting for themselves and left thus until the snow over takes them and they have to be lifted from their roosts and taken to a laying house. Of course they will worry at being confined and it will take two months to get them accustomed and to laying again right while eggs are highest. Do not understand me to be against fowls shifting for themselves as much as possible. This is all right, but at the same time while they are out leading a natural life in the open I want to keep them so under my control and feed them so regular at their proper place that I can handle them at any time and they will roost at night where I invite them. Sounds a little unreasonable but it can be done and done easily by observing the fowls' instinct, following the laws of nature and attention to the little things that make life worth living even for the lowly fowl.

As a final warning do not crowd the young fowls and when they want to roost give them a flat board to roost on.

State Railways.

The capital outlay on all the state railways in Australia amounts in round figures to $900,000,000 and the New Zealand lines to $165,000,000. During the boom the roads did well, former deficits were replaced in some cases by profits, and government ownership was in high feather; unfortunately, there is now a different tale to tell. The correspondent says incidentally that "the plan of promising railways to a widespread number of districts is a weakness of government ownership, as it links railway construction with considerations of political support"—an observation which we in Canada can fully appreciate.

We are not concerned here with the merits or demerits of the case for an increase of rates that is being presented by the Canadian railways to the railway board; but it is well to know that government ownership is not always or everywhere synonymous with cheaper transportation during a period of hard times.—Montreal Gazette.

Scare at Two Things.

Purchaser—And will he scare at anything?

Farmer—M' friend, this hoss is jist afraid of two things: That he won't get enough to eat, an' that he won't hear when I say "Whoa!"—Judge.

WHEN ANSWERING ADS—
Always mention "Everybodys."

The White Laced Red Cornish.

By A. S. Wheeler.

MY PARTNER has bred Blue Andalusians for twenty years, and I am a confirmed Red man. We took up White Laced Red Cornish, as a sideline, something over a year ago, because we liked them, and thought that they had a logical future. Neither of us was altogether green at the game; we had bred both Dark and White Cornish at various times.

My opinion, after a year's experience, is that the variety is the most interesting one I've ever handled. The chicks hatch readily from January to August, and make astonishingly rapid growth. We showed in late December a pullet hatched August 2nd. As to laying: it is all poppycock to say White Laced Reds are poor layers. Two out of three females which we showed during the first week of December, 1914, were laying at the time. In December, 1914, and January, 1915, our White Laced Reds were outlaying Reds and Andalusians in adjacent yards. Barring accident, we will back our belief in their laying ability by entering a pen, next autumn,, in one of the big contests. While we feel that as real tests of laying these contests are more or less uncertain, and know that the conditions are especially unfavorable to Cornish, we are just curious (and confident) enough to put up the money for another "official" trial.

With regard to table quality, there can be no question—and while all this talk about utility is in the air, it may not be amiss to emphasize the fact that flesh-quality is just as important from a utility standpoint, as is laying. In fact, if there's one thing more than another that the average hen-owner wants, it's a plump, sightly and tender carcass, after he has wielded the axe. I don't think I had ever really tasted chicken until I sampled a White Laced Red Cornish cockerel, well and quickly grown, cleanly dressed, and roasted to a turn. The "biteability" that Wid Card talks about is certainly there.

There's no doubt that the variety has a temperament of its own. The chicks are timid, and will remain so under rough handling. When handled with care, however, a majority will drop their Leghorny manner for an extreme friendliness. I can't go so far as to say, as has one breeder, that the hens will answer to their names, for I haven't tried naming them; but I have pullets that follow me all over the yard, and fly up on my shoulders. Possibly the bustling keeper of two thousand birds wouldn't hail this trick with glee, but that a tame hen is a profitable one is axiomatic, and I, for one, would rather push a bird out of the way occasionally than be forced to hunt a long-handled scoop every time I want to catch one.

The big showing of the year was at Boston, and it was a dandy exhibit. But the position, in the darkest corner of the gallery, among the double-tiered coops was dismal to the last degree. When I asked the secretary to give us a better position next year, he said that he could make no promises of any sort. That being so, I suggest that in future we avoid Boston. The fashion in secretaries is passing from crabs to courteous business men, and at many shows new varieties and the exhibitors thereof are now welcomed. Those are the shows which we should patronize. When I enter a string of birds at $2 per item, I don't expect the show officials to turn out to greet me with a brass band and a banner, but on the other hand, I do want an even break on position, competent judging, and reasonable attention when questions are in order. Isn't this attitude fair?

We favor a strong ground color, with sharply-defined but very narrow lacing, as against the lighter red with heavier lacing. How about it, fellow-breeders? An interchange of opinions helps the breed. We also favor, tentatively, a change of name to "Light Cornish." "White Laced Red" is too cumbersome.

WE THANK YOU
For mentioning "Everybodys" when you write our advertisers.

EVERYBODYS NEWS *from* EVERYWHERE

BY JAS. T. HUSTON

The Light Brahma Club will hold their annual meeting and banquet in connection with the Chicago Coliseum Show. Mr. Harvey Wood, secretary, writes us that the membership of this hustling organization has reached 465 and growing daily. This live specialty club is doing much in reviving the interest in one of our most beautiful breeds. Too much praise cannot be given Mr. Wood for his efforts in behalf of the club.

* * *

The Canton Poultry Association Co., Canton, Ohio, are laying elaborate plans for the coming exhibition, Dec. 27-Jan. 1st. Judges of reputation will be employed and every effort put forth to make this one of the greatest exhibitions in the Middle West.

* * *

The Poultry Show held in conjunction with the Fairmont, W. Va., fair, proved to be the greatest poultry exhibition ever held by that organization. Mr. G. Arnett, the superintendent of the poultry department, has been assured by the managers of the fair association that another year would see an addition made to th poultry building. This certainly looks as if exhibition poultry breeding was on the boom, also that interest is on the increase. Our Mr. Earle Wilson, who represented Everybodys at this fair, increased our circulation over three hundred readers and reports to us that this was one of the very best fall poultry shows he has ever attended.

* * *

Write to Bird Brothers, Box J, Meyersdale, Pa., for their catalogue, which will be of great interest to you if interested in Partridge Rocks or Bronze Turkeys.

* * *

In addition to the above, Bird Brothers breed White Holland Turkeys, Peacocks, White Guineas, Registered Shropshire Sheep. This is truly one of the most interesting farms in the country, comprising over three hundred and fifty acres of land, making conditions ideal. Everyone knows that for every dollar invested here value will be returned.

* * *

1,143 new subscriptions was one day's record for September at this office. Truly Everybody Reads Everybodys."

* * *

Our representatives at the various Fall Fairs throughout the country report that the average quality in the exhibits is better than usual, also that where weather conditions are at all favorable, that the attendance is greater than ever before. All of which goes to show that we are on the verge of a good healthy season.

* * *

The calamity howler never will get anywhere. He's a dead one to himself and a nuisance to his friends, if he has any.

* * *

Read on another page of this month's issue what several of the secretaries of the poultry associations who have already received our prize cups think of them. Do not miss this opportunity to secure a premium which will be a source of pride to the winner as well as a credit to your list of prizes.

* * *

The Forest City Fair had rain throughout the week, yet the attendance at the poultry exhibit was large, showing that the interest in pure bred poultry is not governed by weather conditions.

* * *

Under the new constitution of the American Poultry Association, there will be 6 board members elected and one vice president, and all parts of the country will have representation. This is as it should be, as Canada will have one member, New England, one; Eastern States, one; South, one; Middle West, one; Pacific States, one; comprising districts from one to six.

* * *

When you consider that these districts will be represented as above, regardless of the number of votes cast, every member of the American Poultry Association can feel that herein lies equal representation and fairness to all its members.

* * *

Just suppose that every State Poultry organization in the Union would produce the results which have been obtained by the Ohio Poultry Breeders' Association. This grand organization, with her 800 members, and a treasury with $1,000 balance shows what organization can accomplish.

* * *

Where is there a better opportunity to assist and further the poultry shows, than thru organizations such as these. A big strong active poultry breeders association in every state is a necessity, and all that is required to bring about this condition is a little get-together spirit. The results of such organizations will be a greater industry.

* * *

Forty-seven hundred new subscriptions was the August record for Everybodys. Hardly can be called a dull summer month, do you think?

* * *

We regret to learn that Mr. Frank McGrann, of Lancaster, Pa., has resigned as president of the Poultry Breeders Association of Pennsylvania, as we personally knew that Mr. McGrann had many innovations in mind, which could not have helped but result in wonderful improvements in poultry conditions in the Keystone State. This will necessitate an election which has been called by President Thompson, of the A. P. A. to fill the vacancy.

We trust that every effort will be made to select a man who will show the same great interest in poultry affairs, as has our friend Mr. Frank McGrann.

* * *

Write us for special clubbing offers. It is not always possible to publish each month the many combinations we can arrange for you. Tell us just what you desire in the way of good poultry literature and we can supply you, with very little expenditure on your part.

* * *

The war in Europe may perhaps be the cause of some of the hot shots now being cut loose by several well known and popular contributors to poultry journalism. What a waste of good printer's ink?

* * *

Let the daily papers give us the news of the horrible struggle being waged throughout Europe. This is sad reading enough, without our poultry contributors considering it necessary to keep up an incessant fire, which cannot possibly do them any good, but which is sure to react in much harm to poultry interests in general.

* * *

The editor who does not engage in foolish wrangles over petty things, does not necessarily lack spunk, but rather shows a disposition to protect his publication from the criticism of those who have long ago tired of the small things of a great business.

* * *

Foxhurst Farm, Lime Rock, Conn., advertise some exceptional values in their advertisement elsewhere in this issue. Better write them for their handsome catalogue, which illustrates the winners which made famous the Foxhurst Black Orpingtons. For eight years this strain has made history at Madison Square Garden and never before have they been in a better position to furnish you winners.

* * *

Let us again call your attention to the Hagerstown catalogue and ask your co-operation in making it a permanent institution. This, the largest fall poultry show in the country, should always have a catalogue for reference of the exhibition in years to come.

Write us for advertising rates, and get in on this proposition.

* * *

Wilburtha Farms, Box E, Trenton Junction, N. J., have been most successful in raising an unusually large number of choice exhibition and breeding specimens the past season. If you are interested, write them for their new catalogue, which has become the talk of the poultry world. This farm breeds S. C. White and Buff Leghorns, Columbian Wyandottes and Columbian Plymouth Rocks.

* * *

D. E. Hale, editor of the "Big Four" Poultry Journal, has been engaged to judge the Spokane, Washington, Inter-State Fair Poultry Show. In addition to this large exhibition, Mr. Hale will also judge at the State Fairs in Montana and Oregon.

* * *

If a lover of White Wyandottes you cannot invest a dime better than sending to Mr. John S. Martin, Box D, Port Dover, Canada, for his catalogue, telling all about the "Regals," richly illustrated and filled from cover to cover with valuable Wyandotte information.

* * *

Have you as yet seen the Bourne "Bignum" Poultry Band? If not, write them, mentioning Everybodys and they will in turn send you a free sample.

* * *

Balch and Brown, Manchester, Conn., breeders of Light Brahmas, have established themselves firmly with Everybodys readers and we are always pleased to recommend them and their line. They are fanciers who know how to produce birds of merit.

* * *

"Watch the Palace Show" has become a slogan heard and repeated by thousands of poultry fanciers. We are watching, Mr. Howell, and must profess our appreciation of your grand efforts in giving America an exhibition such as the Palace Show.

The Forest City Fair.

The Opening of the 1915-16 Show Season—A Great Display of Over 3,000 Birds. Quality High With Classes Well Filled. Both the Management and Judging Very Satisfactory.—By H. P. Schwab.

THE poultrymen can well leave it to the Forest City Fair Association to yearly open up their show season, providing of course that they will agree to furnish in future a little more sun and a great deal less rain for this event, so that thousands of interested people can enjoy the beautiful displays they arrange for them.

The Forest City Fair is held at Randall, Ohio, about 15 miles from Cleveland, the grounds are large and the buildings very fine while the management is very liberal, and as far as the poultry is concerned, it could not be improved upon. Mr. Sheppard Strong in charge of this department, had seven large buildings filled with a select quality, all nicely arranged and kept clean, it was a real pleasure to view this display which for both quality and quantity was greater than my expectations. Mr. Strong's work was above question and fair to all alike and along the lines that insure greater exhibits there in the future. The judging also was unusually well and promptly done, so that we feel that Mr. Strong and those association members that stood back of him deserve much credit.

It is rather unusual to see at fall shows several feature classes as were seen here, so in justice to all we congratulate the breeders and exhibitors who made this display possible. Here we would particularly mention the classes of White and Barred Plymouth Rocks. Single and Rose Comb Reds and Anconas, White and Silver Wyandottes, Red and Spreckled Sussex Orpingtons, Hamburgs, Pekin Ducks, etc., all worthy feature classes of quality and numbers that was pleasing to see.

The judges did their work with dispatch, with vim and with credit to themselves. They were: Theo. Hewes, Jas. A. Tucker, Ira M. Farber, W. G. Minnich, F. C. Sites, Chas. McClave and J. H. Bush.

THE BIRDS AND THEIR BREEDERS

In Barred Rocks several noted breeders were contesting for honors. Among the winners we note Mr. Geo. W. Engers, Chas. McClave, E F. Pierce, E. W. Moore, etc. The Engers Barred Rock Farms, Bedford, O., won Cock 2-3-5. Hen 2-4-5. Cockerel 1-5. Pullet 2-4-5. Pen 1-2-3-5. Cockerel Pen 1. Pullet Pen 1. Pullet-bred Cockerel, 1. Cockerel-bred hen 1st.

White Rocks were not only one of the largest classes shown, but were also one of the very best. The winners were without exception a rare lot grandly shown, with all their superior quality. Here also were several well known breeders exhibiting, and while Mr. Guy Daily, Jeffersonville, Ind., won about all the leading prizes, he had several close calls and it was only with his superior quality and condition that it was possible for him to make his grand record, which was his full due. Mr. Daily's exhibit was in charge of Mr. C. E. Darkus, who kept things moving and who made many sales. Their winnings were: Cocks 1-2. Hens, 1-2-3-4. Cockerels, 4. Pullets 1-2-3. Pens 1-2. Best display, Shape and Color Specials.

In the Buff Rocks we note Vierheller Bros., Pittsburgh, Pa., winning First and Second Hens. This also was a beauty class with the females particularly strong.

In Partridge Rocks large classes were seen and some rare fine birds. The Bonaparte Park Poultry Ranch, Bordentown, N. J., won Cock 4. Hen 3. Cockerel 4. Pullet 1. Pen. 1. In Silver Rocks they won all the First prizes while their display of Hamburgs, Polish and Bantams were a feature show in themselves.

White Wyandottes as usual make a strong showing at all exhibits, the display here was very fine with the winners fit to show and to win in any show. Mr. John E. Stohl, Cleveland, O., won: Cock 1. Hen 1. Cockerel 1. Pullet 1-2. Pen 1st. These birds are worth all we can say of them.

The Rhode Island Reds filled more than a whole row in one of the long buildings and here was heard the Redchatter from early to late. The exhibitors were not to blame for all this for one of the early trains on Friday brought in Mr. C. F. Rankin, owner of the Schenley Heights Poultry Farms, Pittsburgh, Pa., and Mr. Aaron Fell, Secretary of the Red Breeders' Club of the World, after their arrival "Taps" were never sounded.

The winners in Reds here of both combs have every reason to advertise and recommend their stock far and wide, for it took the best of quality to win. In the single combs Mr. A. Carver, Seville, O., won: Cocks 1-3. Cockerels 1-3. Pullet 1. Pen 1. First Cock a beauty in brilliant, sound color in every section and a near perfect head. Mr. Carver also breeds Red Sussex and these he won all First Prizes.

Other winners in the S. C. Reds were: The Adelphi Poultry Farm, Altoona, Pa., B. M. Billings, C. A. Hosemer, etc.

In Rose Comb Reds Mr. H. G. Stacey, N. Ridgeville, O., made an unusual record of winning all Third Prizes offered. His birds need a little time to finish and to mature, he has the quality in both shape and color, and we hope to see this line again later when they are at their best.

Light Brahmas, a good class of fine birds with first cockerel and pullet, exceptional birds.

Lichtenwalter's Buff Plymouth Rocks

The champion quality line of America.

E. H. LICHTENWALTER : : BOX E : : GIRARD. PA

Speckled Sussex were one of the largest classes at the show and also one of the best. Mr. A. G. Williams won all the first prizes.

Anconas in both Single and Rose combs were large and strong classes. It is really pleasing to note the progress this variety has made and it is evident they are breeding sound and true. Mr. H. Cecil Sheppard, Berea, O., who has ever championed the Anconas has every reason to glory in their success. His exhibit here was simply wonderful for the type, color and markings seen are as near ideal as can be. Every bird he showed deserves mention for its similarity to highest standard demands and I hope that Mr. Sheppard may always receive the credit he so well deserves for all he has done for this variety. His First prize pen of Rose Combs was the best pen we have ever seen at any show. Mr. Sheppard's winnings were: S. C. Cocks, 1-2-5. Hens, 1-3-5. Cockerels, 1-2-3-4. Pullet, 1-2-3-4. Pens, 1. In R. C. Cocks, 2-5. Hen, 3-4-5. Cockerels, 1-2-3-5. Pullet 1-2-3-5. Pen, 1.

Other winners in this class were: J. O. Somers, F. C. Stier, etc.

S. C. White Leghorns, a large class particularly strong in young birds. One grand cock bird noted that was unplaced, while his tail was short we thought him in type, condition and head one of the very best. In this class H. C. & C. W. Sixt won: Cock 1-2. Cockerel 2-3-4. Pullet 2-4. Pen 1.

Black Langshans a good quality class with birds in good condition.

All Orpingtons were seen in fine classes, the young blacks were surely a superior line.

Houdans a large and fine lot, many special quality birds seen here, the winners all very fine.

Hamburgs in all varieties and of grandest quality were another show feature; it was delightful to see this display. All the Hamburgs need to place them up among the leaders is proper push and advertising by the breeders. If they had a Thompson, a Young, a Thompkins or a Dustin in their membership things would surely boom for them.

The exhibit of water fowls filled a building and was one of great interest to all. The Pekin Ducks were a rare quality line with size and shape seen at its best. The Wood Creek Duck Farms, Bedford, O., were the leading winners here, and highly deserving of all.

Bantams filled another building all by themselves and through it from early to late the people went viewing the little beauties. In both Game and Ornamentals the classes were well filled with rare good quality.

Turkeys, Geese, etc., to complete the display were numerous and as noted before, quality was seen in all.

This was our first visit to this fair and we will hope to see their others in the future. "Everybodys" had preceded me and I was glad to meet the breeders and fanciers and to thank them for all their well wishes and congratulations. It surely is pleasing to get right among the poultrymen and to know from them that "Everybodys" is meeting approval and is receiving their support.

A stranger entered a church in the middle of the sermon and seated himself in the back pew. After a while he began to fidget. Leaning over to the white-haired man at his side, evidently an old member of the congregation, he whispered. "How long has he been preaching?" "Thirty or forty years, I think," the old man answered. "I don't know exactly." "I'll stay, then," decided the stranger. "He must be nearly done."

Dr. E. L. Heasley, Holland, Mich., Box F, won 1st and 5th cock, 3rd and 5th hen and 2nd Pen in S. C. Buff Leghorns at the Forest City Fair, the doctor only showing old stock.

This well known breeder has been successful in raising over a thousand head of young stock and can fill your wants in almost anything you desire. Write him for information, stating just what you are in need of, and it will be a pleasure for him to assist you.

For Winter Eggs and For Fattening Holiday Poultry Try

GRAN-O-LAC

Conkey's Dry Buttermilk

Gran-O-Lac is a pure, soluble product, made from the buttermilk as it comes from the churn. It is high in lactic acid and contains all the soluble contents of the buttermilk. Therefore, it will do the same wonderful work that buttermilk does, while it eliminates the handling of sloppy, foul-smelling cans, and also makes possible a regular, uniform supply.

It makes hens lay and it makes stock fatten up nicely. Send 2c in stamps for sample and literature. Taste Gran-O-lac, note its natural acid flavor—and then get a quantity and watch your birds.

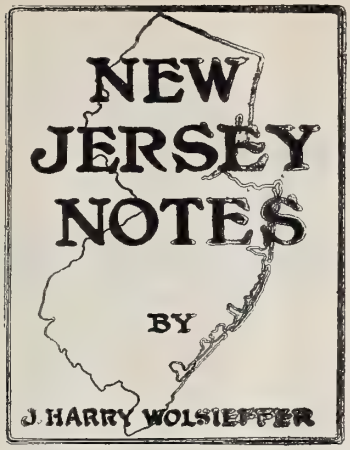
HANOVER, PA.



The New Jersey State Poultry Association held its first annual meeting September 9th, 10th and 11th at the Poultry department, College Farm, New Brunswick, N. J.

The first day of the meeting was held in conjunction with the annual Farmers' Field Day at the State Experiment Station.

Dr. W. H. S. Demarest, president of the college, gave the address of welcome to from eight hundred to one thousand farmers.

In his address Dr. Demarest said that the farmers should be very thankful that this country was not suffering from the war as is our neighboring country on the north. He told of some of the experiences which he personally had gone through while traveling in Canada where he said the war was creating great havoc upon the young generation of farmers in that province.

Following the address of welcome the Hon. Joseph S. Frelinghuysen, president of the State Board of Agriculture, and the Hon. Henry E. Ackerson, senator from Monmouth county, both gave pertinent and pithy addresses for farmers of New Jersey, bringing out strongly the importance of this industry and emphasizing the fact that the state government was not supporting this industry as it should.

In the afternoon J. H. Wolsieffer, president of the association, explained the work of the organization, dividing the work into four heads: namely,

The Legislative work, which at the present time has a committee which is formulating a bill to put before the legislature to stop some of the atrocities practiced by some market men on poultry products coming from this state.

The educational work which was exemplified by the field meeting which was then being carried on.

The publicity work, which meant to keep the poultry men of New Jersey before the agricultural people of this country.

The co-operative work which he mentioned as being the most important. Already he said the association had developed a first class market for eggs in New York, which increased the returns for eggs very materially for members shipping their eggs in this way and that the association had already a system on foot by which the members will be able to purchase grain rations and feed by the carload directly from the West, thereby getting at a very much reduced price.

Mr. Wolsieffer closed his address by saying that any farmer in the State who was interested in poultry should join the association for his own interests as well as the interest of the poultry industry in the State.

Prof. H. R. Lewis, head of the poultry Department of the New Jersey State Experiment Station and College, outlined in detail the excellent work being done by that department and showed how every poultryman in the state could be helped by keeping in close touch with the Experiment Station.

In the evening Mr. A. L. Clark, who organized the co-operative egg market for the association, gave an address on co-operation and brought out the fact very clearly that the greatest need of the farmers, especially in the east, was more thorough co-operation.

The second day of the meeting was opened with a demonstration of caponizing, killing and picking poultry, post-mortem examination of a bird and candling and testing eggs. Af-

SUNSWICK POULTRY FARM, Rufus Delafield, Owner, Box F. So. Plainfield, N. J.

ter the demonstration by the experts the people were given a chance to try their own hands at these various lines under the guidance of the demonstrator.

Following the demonstration, Mr. C. N. Warner, of Tom's River, a very successful poultryman, lectured on the Day Old Chick Industry and the selling of breeding stock. Mr. Warner gave some very pithy and interesting points and figures on this subject, which he derived from the business of this nature, which he has developed to a high degree of efficiency.

In the afternoon of the second day Dr. W W. Sanburn of Mass., gave a very instructive and practical address on poultry house construction. During his address Dr. Sanburn showed how many old farm buildings could with little expense be remodeled into very efficient poultry houses and he also outlined the important factors necessary in a poultry house.

Miss M. Pomeroy, who has for several years been very successful with poultry within commuting distance of New York, gave the ladies present pointers on how they could occupy themselves profitably with poultry. She also said that a great many women who were employed as stenographers and secretaries could do very much better with poultry. In closing she said that she could lay her success mainly to the different courses she had taken at the State College, and the information which she was continually receiving from the Experiment Station.

Dr. H. D. Goodale, of the Mass Agricultural College, explained in a very clear way how poultry should be bred for egg production.

Following this lecture Professor Lewis opened a very interesting discussion on this subject and many present expressed their views and brought out instances along these lines.

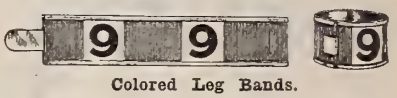
The last day of the meeting was again opened with demonstrations.

Mr. Reese V. Hicks, who is a poultryman known throughout the country, addressed the meeting following the demonstrations. His subject was Commercial Egg Farming and many points were brought out during his lecture which were very instructive as well as interesting.

Mr. Hicks was a fitting close for a program which was full of helpful suggestions and instructive addresses.

The afternoon of the last day was the business meeting of the association, at which time the various committees of the Association reported on the work being done and those present could not help but be impressed with the progressive work of the New Jersey Poultry Association and the advantages which it was giving its members.

A winter meeting which promises to be even better is the next thing which the Association has on its roster.



Colored Leg Bands.
Big Black Figures on White Background.
All colors, all sizes, for all fowls, and pigeons. Birds identified without handling. Baby chick bands 18 colors, not numbered. The best band in the world today. Samples and catalogue 2c stamp. 3c each; $2.50 per 100.

Myers' Barred Plymouth Rocks
"Lady Beautiful" Strain, Pullet Line Exclusively
My winnings, year after year, at the leading shows of America, where the Barred Plymouth Rock Classes are the strongest, show conclusively the quality of my line.

Winners of Five Championship Female Specials at Madison Square, Garden, N. Y., 1914; Philadelphia, 1913 - 1914, Hagerstown, 1914; Williamsport, 1914.
This unapproachable record stands unequalled. It was made at my last five exhibits, competing against all birds in the American Classes.

AT PHILADELPHIA, PA., DEC., 1914
My total winnings were: Hen, 1, 2, 3, 5, 7. Pullet, 1, 4, 8. Pullet-bred Male, 1, 4. Pullet-bred Pen, 2. Special, Best Shape female. Sweepstake Special, Best Bird in American Class.

C. N. MYERS Box E. Hanover, Pa.

THE CROWNED COURA PIGEON

(Lophyrus Cornatus—Vicill)

This magnificent and beautiful bird is a native of many of the islands and of the great Indian Archipelago, being by no means rare in Java and Banda. In New Guiena it is abundant, as well as in most of the Molucca Islands. It inhabits the forests, and feeds upon berries, seeds and grain. It exceeds in size all the other Columbine species, being from twenty-seven to twenty-eight inches in extreme length. The bill, which is two inches long, is black; the tips of the mandibles are thickened, and that of the upper one moderately deflected. The head is adorned with a large, elevated, semicircular, and compressed crest, composed of narow straight feathers, furnished with disconnected silky barbules, and always carried erect. This, as well as the head, the neck and all the inferior parts of the body, are of a pure grayish blue color. Its nest is built upon a tree.

These birds are easily rendered tamed; and in the East Indies they are frequently kept in court yards, as poultry. They have all the habits of the common pigeons—billing, inflating the breast, and cooing. The sounds which they emit, however, are far from being so gentle as those to which we apply that term; they rather become a loud noise. It is said that M. Bougainville's sailors were greatly alarmed on hearing it for the first time, in the wild unfrequented spots of some of the islands they visited, and no wonder, when they considered it to proceed from the savage cries of hostile natives in their ambush, about to break forth upon them. Fear, when once excited, as is well known, strangely exaggerates what is seen, as well as what is heard.

RUBY CROWNED KINGLET

(Regulus Calendula)

Length about 4½ inches. Olive green, soiled whitish below, concealed feathers on head (crest) bright red.

Range: Breeds in southern Canada, southern Alaska and the higher mountains of western United States, winters in much of the United States and south to Guatemala.

Habits and economic status: In habits and haunts this tiny sprite resembles a chickadee. It is an active, nervous, little creature, fitting hither and yon in search of food, and in spring only stopping long enough to utter its beautiful song, surprisingly loud for the size of the musician. Three-fourths of its food consists of wasps, bugs and flies. Beetles are the only other items of importance (12 per cent.) The bugs eaten by the kinglet are mostly small, but happily, they are the most harmful kinds. Treehoppers, leafhoppers and jumping lice are pests and often do great harm to trees and smaller plants, while plant lice and scale insects are the worst scourges of the fruit-grower—in fact, the prevalence of the latter has almost risen to the magnitude of a national peril. It is these small and seemingly insignificant birds that most successfully attack and hold in check these insidious foes of horticulture. The vegetable food consists of seeds of poison ivy, or poison oak, a few weeds and a few small fruits, mostly elderberries.

Will You Do This?

When writing advertisers, mention "Everybodys." Thanks.

The

"Silent Smith"

New Model 8

One of the greatest retail merchants of the country built his business upon the maxim—"The customer is always right." This principle has been followed in the manufacture of the

L. C. Smith & Bros. Typewriter

The wants of the **user** have dictated its construction. The **user** has decided in favor of certain improvements, now incorporated in the New Model 8. Here are some of them:

Silence of Operation—The most silent running efficient typewriter ever placed on the market. Absolute silence has been very nearly attained.

Decimal Tabulator—A help in billing and tabulating. There is no extra charge for this convenience.

Variable Line Spacer—Enables the operator to start on a given line and space from point of starting; also to write on ruled lines whose spacing varies from typewriter spacing. A great help in card work.

Faster Ribbon Feed—Insures new place of impact for each type face.

Choice of Carriage Return—Upon special order the new left hand carriage return will be furnished in place of the right hand.

All the important features of previous models have been retained—ball bearing carriage, typebars and capital shift; back spacer, key controlled ribbon, removable platen, protected type, flexible paper feed and automatic ribbon reverse.

Write for new catalog of Model 8. .... It will explain why the L. C. Smith & Bros. typewriter is a synonym for superior service.

The Wyandotte of the Future

By A. P. Marshall, Niagara Falls, Canada.

WHAT shall we have five, ten or fifteen years from now under the breed name, Wyandotte? Shall it be the useful bird of curves that we have now, or will some wave of destructiveness change the breed to one of angles and lines so that it will lose its distinctiveness and lose the charm and purpose unsurpassed now by any of the other breeds. Can anyone fancy a sensible breeder losing half of the value of this noble bird by forgetting entirely the round, full bodied symmetrical shape for something essentially different in many ways?

The new standard, with its approved cut of the Wyandotte should hold the ideals of the breeders for a time and should dispel from the minds of any who have gained the wrong impression that the Wyandotte is a long bodied bird. Any idea of this kind is bound to result in failure. We doubt if the best breeders will have to change their style a particle to conform to the standard. The good breeders have kept their birds of sensible length and will not make their birds longer. In fact this would not improve them in any way whatever, but simply have a tendency to lose the individuality of the breed to the loss of many years of good effort in perfecting something with a lasting value.

When one considers how continuously birds keep reverting to old faults, surely there is much to keep the breeder constantly working without carelessly allowing the breed to deteriorate because of a fancied notion that so long as utility is strong, form and breed characteristics amount to nothing. One might just as well contend that any mongrel birds showing high production are just as valuable as the pure bred fowl. This idea is expressed by people with little experience. Continued experience soon dispels the idea that the mongrel can be expected to give good results.

And then at any stage they are worth a great deal less. Not altogether because of the difference in productive power, but because people want something right when they are getting it and with the pure bred they can depend on it; whereas, with the mongrel it is hit and miss at best, depending often on what pure blood the birds may contain.

There is a reason why the present Wyandotte is one of the most popular breeds of today. It is not because it is more extensively advertised, has had more encouragement from publications, or any reason of that kind, but because it meets the needs of so many people. People want a breed that will dress up well at any stage, dead or alive and give the best amount of eggs in value in dollars and cents. No other reason could make the Wyandotte so popular and it is going to remain so as long as those turning them out in quantities keep the country furnished with this all-around type of excellence.

Of course there are ways in which some breeders can improve points in their strains to great profit. Take the matter of single combs. Some breeders hardly ever see a single comb. With us it is a great rarity. Yet this season we introduced a pullet from another strain and we got single combs from almost every egg we hatched from her. In fact so persistent was this that we could gamble on a single comb every time. With such a trial mating we keep all the blood out of the flock until we are absolutely sure of it.

Ticking in the plumage and irregularity in other sections can be corrected to advantage by careful selection and better style and finish put on the birds without in any way losing their profitable producing qualities. If we expect to improve the type it will not be by jumping to an extreme ideal, but by the slowest process of improvement, from year to year.

None can say what the breed may be in a number of years from now but it is safe to say that any one trying to develop one side of this all around breed to the detriment of the other will lose out in the long run. To hold the unique position of the Wyandotte the type must remain one that has been considered essentially Wyandotte and if the breed is to hold the pre-eminent place it does, we believe care will be exercised to retain those qualities that make the satisfying market bird, producer of lots of eggs at the highest average price and of form unbeaten by any of the other breeds existing.

Of course the white will always be in the greatest demand. Every requirement of the man wanting the best all around bird in small flocks furnishing meat and eggs of the best all season and offering a breed that will supply the complete hen machine to carry on all the functions of the year round work is embodied in a plump, well balanced bird. Keep them where they are in comparison with the other breeds and they will always fill a niche that none of the others can quite equal.

Editor's Desk

EVERYBODY READS EVERYBODY'S

THE interest noted at all shows held so far in both the Red and Speckled Sussex is bound to make them one of the popular breeds. They surely have much to commend them to the breeders who favor a white-meated fowl. Mr. Frank L. Platt, Swanton, Ohio, has sent us a little booklet of the history and descriptions of the Red Sussex for which we are very grateful. This breed is in the hands of good fanciers here in America and we look with fond hopes to their future.

* * *

The New York State Fair with 432 exhibitors and over 9,000 specimens entered, has set a new high water mark for poultry exhibitions. We take this as a special compliment to Mr. Wm. H. Manning, who deserves credit for all.

* * *

Our late trip through the Mid-West was one of special interest for us. We had met most of those breeders before, but some years ago, and our interest at this time was to note the quality of their stock and to see what improvement has been made. Well we have seen and know their calibre. All is to their credit. They not only have the very finest quality of stock, but they are also as game and clever a lot of breeders as we have met with.

* * *

It is quite true that they are stronger in some varieties than they are in others, but in all they show careful breeding, grand forms and good size. We would like to see the best from the East and the Mid-West meet at a border show like Pittsburgh or Buffalo. It would surely be interesting for all and would give to poultry a stimulus that would do more good than any other one thing we can think of.

* * *

In our next we expect to mention our visit to the Aldrich Farms, Columbus, Ohio. This well known line of White Orpingtons, with their winnings at M. S. Garden, New York, Chicago, Allentown, etc., is one of popular interest to all breeders and just at this time, with their large line of early matured birds fit to win is news for our readers to benefit by.

* * *

The Ohio State Poultry Association held a well attended meeting at the State Fair and elected the following officers: President, F. C. Stier; vice president, Charles E. Cram; secretary, Prof. F. S. Jacoby; executive board, Messrs. Ora Overholser, J. E. Humbach and J. H. Busch.

* * *

We wish to ask our readers this special favor: When you write to the advertisers in this magazine, please mention the fact that you saw their adv in "Everybodys." By your complying with this request, and in this way only do we get the credit due to us. You also owe this to yourself and to the advertiser as well, he is anxious to know just what papers give him results in sales made. So if you will remember and mention "Everybodys" every time you write we will appreciate the favor highly.

* * *

Day by day our circulation is growing so that this issue will be the largest by several thousand copies that we have printed. The past two weeks has brought us over 3,000 new subscribers and they are still coming at a rate to break all former records. I feel safe in predicting that by January we will have 75,000 subscribers or more. We are after that 100,000 mark, and we are going to make it too.

* * *

Let me call your particular attention to the articles in this issue by Prof. Harry R. Lewis, Estelle E. Collier and W. C. Thompson. Be sure to read them. Also the others, for there is value in all.

* * *

There is special value in clear and strong set ads. Class counts, and is worth the price. Look through this issue and note the distinctive styles and individuality in which we set our ads. I should say in which "Jack" sets them. Give him the opportunity and he will serve you well also.

SILVER WYANDOTTE BREEDERS, TAKE NOTICE

The annual catalogue published by the Silver Wyandotte Club is now ready for mailing and will be sent free to all those who will write for it. The catalogue contains interesting articles, cuts and advertisements contributed by the leading breeders of America.

H. J. GOETTE, Sec'y, St. Paul, Minn.

WE THANK YOU

For mentioning "Everybodys" when you write our advertisers.

ENGER'S BARRED ROCK FARM

Have won more First, Second and Special Prizes during the last three years than all our competitors combined at Cleveland, Ohio's winter Shows and the Forest City Exposition, Cleveland's Summer Show. This great winning proves beyond all doubt they are Ohio's foremost strain of Barred Rocks.

If it's a prize winner you want, write us today. Prices reasonable. Send for descriptive booklet. Fifteen acres devoted to Barred Rocks.

GEORGE W. ENGER, Station E, Bedford, O.

FISHEL'S WHITE WYANDOTTES

are proving their superiority at the shows this fall and our customers are winning as well as us. At the Indiana State Fair we won **First, Second and Third Cock; First and Third Hen; Third Cockerel; First Pullet; First and Third Old Pen and First and Second Young Pen,** in very hot competition.

At the Kentucky State Fair we showed two cocks, two hens and two pens and won **First and Fourth Cock; First and Third Hen and First and Third Pen.** Ask any one about the class of White Wyandottes there. These wins demonstrate that this strain is by far

THE WORLD'S BEST

Remember that this strain is bred for utility as well as fancy; meat and egg production are also considered at all times. Send for catalogue and sale list for October.

J. C. FISHEL & SON

Box 50 **Hope, Indiana**

THE INDIANA STATE FAIR

A Great Display of High-Quality Poultry, Classes of Unusual Size and Merit, Noted Breeders, Exhibiting and Attending. White Rocks and Wyandottes With Reds and Orpingtons Feature Classes. Everybody Likes Everybodys.—H. P. Schwab.

This was our first opportunity to attend the Indiana State Fair and meeting with some of the great breeders of the Mid-West and if we ever miss another it would be our fault. The display of poultry was far greater and better than we expected and our expectations were very high, for we knew of the Fishel's, Pierce's, Woolery's, Spaugh's, Carter's, Martz's, Hark's, Johnson's and many others whose names are known and respected and whose stock for many years have been an important factor the country over. Still and for all this, the classes were larger and the quality better than we could hope for. This display carries with it plenty of credit for all.

The breeders of the Mid-West are a jovial lot. Next to breeding fine birds, their passion is to entertain and believe me, there is not an amateur among them. So I have already booked myself for their next show. We found then that "Everybodys" has made an impression and has been received with favor which is most pleasing to us. We hope we may merit the support and the good will of the breeders met there.

Mr. Theo Hewes will report this fair fully, as our stay was short on account of other arrangements made. Still we report a few of the classes of special interest seen.

HOPE, IND.

The United Poultry Farms exhibited in several of their varieties winning strongly in all. They breed the popular varieties in which it requires the best to win. In Barred Rocks they won at the Indiana State Fair: Cock, 1, 2; hen, 1, 2; cockerel, 1, 3; pullet, 1, 3; pen, exhibition, old, 1st; young, 1st.

P. F. McCarthy, Fortville, Ind., won Cockerel, 1, 2; pullet, 2, 3. He has won both here and at the winter show for some years. His birds show grand shape and color.

White Plymouth Rocks were one of the great classes of the show with eleven exhibitors competing, quality was pronounced. The first prize cockerel, one of rarest type, fine head and sound, pure white color. In shape, style and finish he was simply ideal, a model. Other cockerels were grand and so were the pullets. This class was a show in itself.

U. R. Fishel, Hope, Ind., made a record win here; one he was fully entitled to with the quality that has special worth and value. He won: Cockerel, 1-2-3; pullet, 1-2-3; cock, 2-3; hen, 1-2-3; old pen, 1-2; and young pen, 1-2, and all specials.

In the White Wyandottes was seen another beauty class, strong in numbers and of finest quality. First cock, a noble bird of extra breast, back and tail, while both the winning pens were very select and well mated. J. C. Fishel & Son, Hope, Ind. won: Cock, 1-2-3; hens, 1-3; cockerel, 3; pullet, 1; old pen, 1-3; young pen, 1-2.

In Rhode Island Reds, Buschmann-Pierce Red Farms, Hope, Ind., won on Rose Combs: Cock, 1-2; Hen, 1-3; cockerel, 1-2; pullet, 1; old pen, 1-3; young pen, 1-2; on single combs: Cock, 1; hen, 1-2; cockerel, 1-2; pullet 1-3; old pen, 1-3; young pen, 1-2; This line has proven to be universal winners. Here we were shown hens 3 and 4 years old as sound and strong in color as a pullet can be. Mr. Pierce has brought this line to the front, their evenness in all sections is admirable.

White Orpingtons are very popular in the Mid-West by the class seen here, which for general quality, conditions, etc., one of the best ever seen at a fall show. It looked like a class at New York show, and there were birds there that would grace any show at any time. The Woolery farm Bloomington, Ind. won the leading winners with cock, 1-2-3; hen, 1-2; cockerel, 1-2-3; old pen, 1; young pen, 1. This line has been a prominent winner at Chicago, Illinois State Fair and other leading shows. It was pleasing to note their grand forms and the condition of this line.

Among other notable displays were the Partridge Wyandottes, the Sheffield Farms, Glendale, O. With H. B. Hark in charge won: Cock 1-2-3; hen, 1-2; cockerel, 1-2-3; pullet, 1-2-3; old pen, 1-2; young pen, 1-2. We have seen this line a leading winner for many years at our best shows. In shape and color markings they are wonders. Their winning young pens show superior quality and grand improvement. Mr. Hark has surely done well with his line.

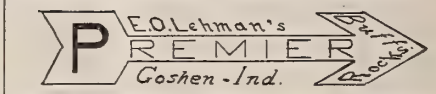
Black Orpingtons were another sensational class with the Blue Ribbon Poultry Farm, Columbus, Ind., winning every first, second and third prize offered. Here the birds were seen in both old and young, of the richest and soundest color, rare shape and perfect finish, the size and bone of this line is also a feature worthy of mention. Carl J. Carter has his every interest centered in this line and his success is commendable.

Buff Orpingtons were also a beauty class, as were also the Buff Rocks and Wyandottes, and Langshans, good in quality and numbers. Buff Cochins, one of the big classes of the exhibit First cock, a corking one. Brahmas in Light and Dark were both quality classes. Frank Johnson, Superintendent, could either be found there or in his office at any time. His Light Brahmas were the leading winners as usual.

S. C. White Leghorns also a fine class, the young particularly good.

The Judging as a rule was satisfactory, that done by Messrs. C. I. Fishel and W. W. Fike was above question; both these judges are capable and do their work without any frills or delays; would like to see them at some of the Eastern Shows.

Among the prominent poultry visitors here, we met Mr. W. S. Martz, breeder of the "Fashion Plate" Buff Orpingtons. Mr. M. S. Barker, the Black Langshan Champion; Mr. D. K. illiamson, the man who won the Championship for best R. I. Red Male at the late Chicago Show, and others of note. Yes, we want to make this fair again next year and meet more of the Indiana breeders.



IN THE GOOD OLD DAYS

Under this head we will monthly publish a select line of articles published years ago that are of special interest to the breeders of this age. We also ask for contributions for this department either in books, Poultry papers or in manuscript form.

WASTE OF POULTRY FOOD

Poultry World 1873

If the poultry keeper finds that his profits do not meet his rational expectations, his first question should be whether proper economy has been practiced in the matter of feeding. For one of the most common errors in poultry-yards is a too great supply of food, so that a great deal that is given remains uneaten, while the fowls show their cramming by listlessly standing about and in the diminishing number of eggs and quality of chickens. Probably most breeders err in this matter, for how few there are who feed with such care as to make full allowance for the season, the health of the flock and the variations in their number and size. Yet all these causes bring about considerable difference in the amount of feed needed to be given.

The best way is to experiment carefully mixing up a small portion of food and when this is eaten, feeding again, if necessary, and remembering that one extreme, that of over-feeding is as bad as the other. In fact it may be worse, where the fowls have any run, they will, if underfed, scratch about actively, and supply the lacking quality themselves, a thing desirable, also, for other reason than economy. The exercise renders the fowls healthy, vigorous, and where poultry is kept simply for amusement, it will be found that the display is always most pleasing when the flock is hunting for food.

COOKED FOOD FOR POULTRY

Poultry World 1873

An important question to keepers is the comparative value of raw and cooked food. That the latter is not natural is not a convincing reason, because to domestic animals the word has no application. They are in a peculiar condition in many respects, resulting from the long continued influence of domestication. Besides there is no objection to departing from the ordinary food of any animal, if the substitute can be shown to be as easy or easier of digestion. In reference to this point, it must be decided by experiment.

Now, the experiment has been made over and over again. Swine have been fed with raw and cooked corn in equal quantities and the result, by weighing is from twenty to forty per cent. in favor of the cooked article. We are accustomed, with our fowls, to boil a part of the corn in the kernel, and they do well,and we find the practice to be much in vogue. However, it must be said, that the fowls soon tire of it and cannot be induced to touch it if raw corn can be had. The food is also sometimes steamed.

The corn may be boiled upon the ear, thus saving the labor of shelling it. It is more economical to boil corn in the kernel than when ground, as there is saved, not only the cost of grinding, but some labor in the cooking process; for mush must be continually stirred while corn in the kernel will not 'burn down" if suffered to rest on a perforated plate a few inches from the bottom of the kettle.

We may remark that it is claimed by some chemists that the food value of certain articles is increased by cooking, increasing the actual amount of nutritious substances in them.

Another method of softening grains sometimes employed, is fermentation, which turns the starch of the grain into sugar, changing it into a substance more easily digested. Brewers' grains are much given, but should be used only in alternation with whole grain, because they are too moist and purge the fowls. They are to be recommended in the rather rare cases when costiveness is complained of.

COLUMBIA

"Gee! This Beats Going To Town All Hollow!"

"All the music of all the world—and most of the fun of it, too," is ready for you always with a Columbia Grafonola in the home. Grand opera, overtures, bands, instrumental, dance music, ragtime, comics—all are at their best on Columbia Records played on a Columbia Grafonola.

Barring vs. Color

The Contrast Between the Light and Dark Bars Determines the True Color of the Barred Plymouth Rocks.—By Charles W. Orton.

THE past few years many of our Barred Rock Breeders have shown a tendency to value extremely narrow barring above all other qualities and to sacrifice color in reaching this end. We have often been told that shape makes the breed and color the variety; why then lose sight of this all important feature in an effort to produce something that, when attained, proves undesirable and unsatisfactory?

It is a common occurence in the show room to come upon a group of enthusiasts digging into a specimen, counting the number of bars to the feather, and hailing with shouts of joy, the narrowest barred bird on exhibition, completely oblivious to the fact that, at a distance of fifty feet, the bird would appear to be solid colored.

It is the contrast between the light and dark bars that determines the color of a Barred Rock, and it is the clean cut, snappy color that gives the bird its attractiveness.

While the Standard tells us that the colors must stop short of positive black and white, the light bar is the foundation on which we have to work, and should approach very nearly pure white. It is then possible to produce a dark bar without any trace of foreign color or metallic sheen, yet strong enough to give an intense contrast, which is the ideal we should all seek to attain.

This ideal color does not fade readily, nor show brass or bronze, and, as a rule, comes through the moult bright and clean. While moulting has a tendency to coarsen the barring and to make the bird appear a shade lighter than before, a close examination will show the same quality of color in both bars.

Naturally barring has an important influence on color, and to properly balance the contrast, equal spacing of the bars is necessary. If the dark bar exceeds the light in width, and this is what narrow barring generally consists of, a dark, heavy effect is produced; on the other hand, when the light bar is wider than the dark, the color appears weak and washed out. Strong, clear under-barring is generally found in combination with propely spaced surface barring, and is essential in securing the desired effect.

Evenness of color and proper tipping of the feathers should also receive due consideration. Many otherwise excellent specimens, especially females, run too dark in hackle and wing, which fail to harmonize with the other sections, and throw the whole bird out of balance. Each feather should end in a clearly defined dark tip, or the bird will have a frosted appearance that is very undesirable.

Let us have narrow barring by all means, but combined with equal spacing and the bright, clean color that makes the Barred Rock the most attractive fowl bred by the fancier.

THE "BEST YET" ALUMINUM LEG BAND. Cannot come off, comes bent ready to apply. 5 sizes, pigeon to turkey. State breed. 12-15c; 25-20c; 50-35c; 100-60c. No stamps. Also colored leg bands seamless pigeon bands; cir. free. **Aluminum Marker Works, Dept. M, Beaver Falls, Pa.**

Good For All Your Birds All the Time

Conkey's Poultry Tonic

is not an over-stimulant—but a nerve and body builder that regulates the organs and the egg yield because the birds get the good of all the food they eat.

Use Conkey's Poultry Tonic this winter and watch how bright and happy your birds will be and how the eggs will keep rolling in. Get a pail or package from your dealer or write us—you can't afford to experiment—and you and your birds are safe when the name Conkey's is on the package.

Also—have Conkey's Roup Remedy handy. One can never tell when roup will appear, so being ready is vitally important. 25c. 50c and $1.00 per package at your dealer's or by mail.

NEW BOOK FREE BROWN POULTRY FENCE

Costs half as much as netting, lasts 5 times as long. Get book of freight prepaid prices. Direct from factory. 150 styles of fence, gates and steel posts. Sample also free.
Brown Fence & Wire Co., Dept. 97 Cleveland, O.

H. F. RIKHOFF'S SINGLE COMB BROWN LEGHORNS

Repeatedly show they are the leaders by winning in a class of 65 Browns at the Indiana State Fair, September, 1915—winning 1, 3, Cocks; 1, 3, Hens; 1, 3, Cockerels; First Pullet and First Pen. This again proves my birds are in a class by themselves; also remember my winnings at Madison Square Garden and the Coliseum Chicago Show for the past six years with a record of 7 Firsts at the Chicago Coliseum, December last. Do not hesitate. Get the best at headquarters. I can fit you out for any show, or with high class breeders. "Get on the Map" by getting a Rikhoff Pullet-bred Cockerel. Write today.
H. F. RIKHOFF ——528 Occidental Bld.,—— INDIANAPOLIS, IND.

Notes From the Mid-West

BY THEO. HEWES

THE poultry exhibit in connection with the Indiana State Fair held at Indianapolis September 6th to 10th was the best, in point of number that has been held for the past five years, and in quality compared favorably with any show that will be held during the month of September east or west. This state fair is something of a fanciers' show, so far as poultry is concerned. While there are a few of what is known as "carload" men, the majority of the exhibit is made up of specialty breeders, and competition in all of the leading classes is nearly as strong at the September show as it is at the February show, and the buying public has learned the true value of winning specimens, and there is nearly, if not quite, as much importance attached to them as there is at the winter exhibitions.

The most important classes in the show this year was the Plymouth Rocks in the Barred and White. White and Partridge Wyandotte, Buff White and Black Orpingtons, Rhode Island Reds, Brown Leghorn and nearly all varieties of bantams. In fact the bantam show, for the first time in several years, was one of the features of the exhibition, and there have been few better birds shown at this season of the year.

The first prize pullet in the White Cochin Bantams was, we believe, the best ever shown in the Mid-West and compared favorably with the best birds that we find in New York and Boston.

The attendance was remarkably good throughout the week, but the crowded condition of the building and the poor arrangements for cooping placed the breeders at a decided handicap. For years the fanciers have been compelled to show in the old building, and with only about half enough cages, which necessitated the showing of two or more females in the same coop and this coupled with the fact that the management was none too tidy about keeping the show in respectable shape, caused considerable comment, and not without just cause. Plenty of feed and water was provided, but we do not believe the floor was cleaned from the opening, Monday morning, until the closing, Friday night. This, coupled with two severe rain storms that came up in the afternoons and the extreme heat that followed the storms, made everything around the buildings sweltering hot and stuffy.

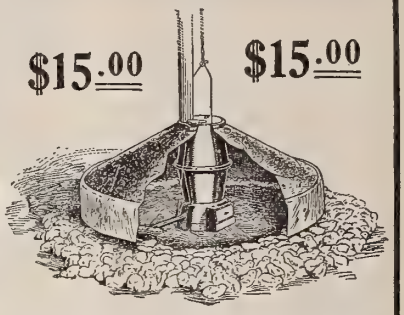
We will not attempt to give a complete list of awards, in my report of the Indiana State Fair, or in fact, of any other State Fair. What I think Everybodys readers are interested in is the classes that really possessed special merit, and who the parties were who were able to produce these birds, so we will take the classes as we named them and refer to the specimens that possessed this quality, together with the name of the exhibitor.

Barred Plymouth Rocks—C. E. Spaugh, of Rugbee, Ind., and P. F. McCarty, Fortville, Ind., showed three pens of young birds in the exhibition class that are seldom equaled at this time of year. There was that same snappy barring in females, that same good general shape and all females well matured, but unfortunately each pen was headed by rather an immature male, leaving the question of judging to a toss-up. We believe the final decision was: Spaugh, first; McCarty, second and third.

White Rocks—F. L. Dee, Franklin, Ind., exhibited a cock that was about as good as has ever graced Indiana Fair Grounds. He was shown in the pink of condition. He is good in shape, color and eye. This bird won first, U. R. Fishel winning second and third cock, first, second and third hen, first, second and third cockerel;

BROODS 1500 CHICKS

$15.00 $15.00



The "Standard" Colony Brooder

The greatest coal-burning brooder ever invented. Self-feeding—self-regulating—everlasting solid cast-iron stove. 52-inch hover. Guaranteed better than any brooder on the market. Sold on 30 days free trial and you write your own money-back guarantee.

EVERYBODY'S FOWL

is a fowl that meets the requirement of everybody; a fowl that is the best table fowl, a fowl that produces the most eggs and a fowl that can win the prizes if need be. You have all this in

U. R. Fishel's White Plymouth Rocks

More of FISHEL White Rocks sold than any other fowl. Why? Because they have proven they are the best in poultry. Prize winners—East, North, South and West as well as across the pond. If you want fowls that have vitality and blood lines to give you results, buy **Fishel's White Plymouth Rocks.**

Write me your wants, please. I want the address of everyone interest in White Plymouth Rocks.

U. R. FISHEL

BOX 11 HOPE, INDIANA

first, second and third pullet; first and second old hen, and first and second young pen. Mr. Fishel's exhibit at Indianapolis was one of the best we have had the pleasure of handling for a long time. Every bird shown in the pink of winter show condition.

White Wyandottes—J. C. Fishel & Son, of Hope, Ind.; Carrington Jones, Buntyn, Tenn., and J. M. Demberger, Stewartsville Ind., had a little battle of their own. When the smoke was cleared away, Messrs. Fishel had won first, second and third cock; first, second and third hen; third cockerel, first pullet, first pen of chicks. Jones: second hen, second cockerel, third pullet, second pen of fowls. Demberger: first cockerel, second pullet and third pen of chicks.

Partridge Wyandottes—There was a walk-away for the well known and well established strain of the Sheffield Farms, Glendale, O. Mr. Hart, the manager of this farm, has made a national reputation for himself as a breeder of Partridge Wyandottes. He has probably shown at more national shows and won more prizes on this one variety than any other five men in America combined. His winnings at Indianapolis were: First, second and third cocks; first, second and third hen; first, second and third cockerel; first, second and third pullet; first and second pen of both old and young.

Single and Rose Comb Reds—The United Farm Co., Hope, Ind., won the bulk of the prizes. These birds were shown by W. C. Pierce, who is in charge of the United Farm Company's exhibit, and this is only one of the many big winnings they have made in the past few weeks. They are exhibiting many of the standard breeds, and like their special lines, all these odd varieties are of high quality. This is especially true of the Dark Brahmas. We believe they showed the best old and young birds that we have ever found during the month of September; and in fact, better birds than we usually find at any time of the year.

White Orpingtons—The Woolery Farm, Bloomington, Ind., was out with one of the best strings they have ever shown at the fair, and this means one of the best strings that was ever shown at the fair. In fact, their exhibit from cocks to young pens was good enough to go into the winter exhibitions with a fair chance of winning. Mr. Woolery is one of the best known breeders in this variety in the Mid-West, devoting his entire time and attention to the breeding of this one variety.

In **Buff Leghorns**, Bruce & Abbot, Whiteland, Ind., had the best of the argument, winning five firsts.
